Historically, we think that a great deal of the present trouble can be shown to be due to Bismarck. He always posed as the servant of the Kaiser, not of the Reichstag. It was his custom to refer to his "old master"; and he lost no occasion to exalt the Imperial prerogative. But this was only a convenient fiction for the Iron Chancellor. As between himself and the aged Emperor, he knew perfectly well which was master. In all important matters, William I did as he was bid by Bismarck. It was the Minister, not the King, who ventured on the policy of creating the Prussian army without the consent of the Parliament; it was Bismarck who dictated the terms of peace with Austria much against the royal will; it was he who altered William's Ems dispatch so as to make war with France inevitable; and it was Bismarck who, as Chancellor of the Empire, imposed his policies upon the Emperor, under the guise of being an obsequious servant. But the artificiality of this relation, which was a weapon in Bismarck's powerful hand, has not worked well with weaker Chancellors and a more heady Kaiser. The result is the confusion and sense of national humiliation with which Germany is filled, and from which the only sure escape is the creation, sooner or later, of a Ministry responsible to the people through their representatives in the Reichstag.

Even in domestic affairs, Ministers holding office at the pleasure of the Emperor have not been able to get on well. Instead of a new Ministry, in the event of failure to command a majority in the Reichstag, the only remedy has been to get a new Reichstag, or to intrigue with the groups in the old one. This method has led to unnatural and unhappy political alliances; to concessions now to the Catholics, now to the Junkers; and has made a stable policy almost impossible. As Bismarck frankly said in the Reichstag in 1881: "There are times when we must govern in a liberal spirit, and times when we must rule dictatorially." Such is the wavering attitude, such the inevitable inconsistency, that follow from a system by which the Ministry is forced to makeshifts like Von Bülow's "block" policy, instead of submitting itself to the expressed will of the people through their elected delegates. Those cannot be wholly wrong who predict that Germany will date from the agitations and humiliations of this year a movement to make her government more truly a constitutional monarchy.

THE BEREA COLLEGE DECISION.

The Supreme Court's opinion that the Kentucky law forbidding the co-education of blacks and whites is Constitutional, is of minor significance, so far as it affects a single institution, or even the educational system of a State. What is important is the establishment of a principle that, under stress of popular passion or prejudice, may be invoked in defence of the gravest injustice. Forty years ago no American would have dreamed that the Supreme Court would make it illegal to teach colored children and white under the same roof. Yet that is the effect of this decision in Kentucky and elsewhere. Berea College was founded before the civil war, for the education of whites; but when it reopened after the war, both whites and blacks were admitted. Yet the institution grew and flourished and became the most important influence in uplifting all the inhabitants of the region. No scandal ever attached to its work; children of both colors studied together in harmony. But in 1904 the Kentucky Legislature decided that this arrangement savored too much of social equality, and passed a law forbidding the education of blacks and whites

within twenty-five miles of one another by the same institution. It is credibly reported that many of the legislators who voted for the bill did so only under the threat that every man who did not "would have the 'nigger' question brought up against him in all his future career." In short, the sole excuse for the law was sheer naked prejudice.

Naturally, the authorities of Berea appealed to the courts. The endowment fund had, in part at least, been contributed with the express understanding that it was to be used for the benefit of both races. In some cases bequests were obtained solely because of the testator's interest in the colored people. Hence it was held that the Kentucky law forced upon the college the violation of contractual obligations. The college officials argued, further, that the law invaded "the sanctities of personal liberty and, if allowed to stand, would curtail the inalienable rights and liberties of whites and colored alike"; and that their struggle was "one for the liberty of every citizen."

The Supreme Court of Kentucky having upheld the law, recourse was had to the Federal Supreme Court. But this tribunal has generally managed to evade any direct judgment upon the various discriminations against the negro in the Southern States; and in the Berea case, as in others, the decision rested upon technical points. As read by Justice Brewer, it deals entirely with corporations as affected by the Kentucky statute, and—so runs the press report—"did not consider its applicability to individuals." Justice Brewer, for the majority of the court, construes the Kentucky law as in effect an amendment to the charter of Berea College, and then says:

> It is undoubtedly true that the reserved power to alter or amend is subject to some limitations, and that under the guise of an amendment a new contract may not always be enforceable upon the corporation or the stockholders; but it is settled that a power reserved to the Legislature to alter, amend, or repeal a charter authorizes it to make any alteration or amendment of a charter granted subject to it, which will not defeat or substantially impair the object of the grant, or any rights vested under it, and which the Legislature may deem necessary to secure either that object or any public right. . . . We need concern ourselves only with the inquiry whether the first section of the Kentucky law can be upheld as coming within the power of a State over its own corporate creatures. We are of opinion that it does come within that power.

In short, the judge is chiefly anxious lest the right of a State to control one of its corporate creatures be impaired.

In the minority opinion, however—expressed by a Kentuckian at that—Justice Harlan points out that in safeguarding the State's control over corporations, the door has been thrown open to many an abuse. He wishes to meet the real issue squarely, not to dodge it; he insists that the court should decide "whether it is a crime, under any conditions, to educate white children and negro children under the same roof." He will not concede that it should be so regarded:

> Have we become so inoculated with prejudice of race that an American government, professedly based on the principles of freedom and charged with the protection of all citizens alike, can make distinctions between such citizens in the matter of their association for innocent purposes simply because of their respective races? Further, if the lower court be right, then a State may make it a crime for white and colored persons to frequent the same market places at the same time, or appear in an assemblage of citizens convened to consider questions of a public or political nature in which all citizens, without regard to race, are equally interested. Many other illustrations might be given to show the mischievous, not to say cruel, character of the statute in question, and how inconsistent such legislation is with the great principle of the equality of citizens before the law.

These words go to the root of the matter. If the Kentucky statute is Constitutional, a law might be passed forbidding the education of Jews and Gentiles in the same college, no matter what the desire might be of the individuals concerned. Such an enactment, opposed as it might be to the American theory of government and the fundamental ideals of this republic, would not be more contrary to the spirit of our institutions than the Berea decision. If that ruling is good law, it is bad morals.

PUTTING THE MARINES ASHORE.

By one stroke of his pen last week, President Roosevelt removed from all ships of the navy the marines who have formed a part of the complement of every vessel of any size since the first American man-of-war went to sea. In accordance with the power vested in the President by Section 1619 of the Revised Statutes, he decreed that hereafter the Marine Corps shall be used only

(1.) To garrison the different navy yards and naval stations, both within and beyond the continental limits of the United States.

(2.) To furnish the first line of the mobile defence of naval bases and naval stations beyond the continental limits of the United States.

(3.) To man such naval defences and to aid in manning, if necessary, such other defences as may be erected for the defence of naval bases and naval stations beyond the continental limits of the United States.

(4.) To garrison the Isthmian Canal Zone, Panama.

(5.) To furnish such garrisons and expeditionary forces for duty beyond the seas as may be necessary in time of peace.

To say that this order is revolutionary, is not to say that it is unwise; it will be hailed by the bulk of the line officers of the navy as a great victory for progress. To the officers of the Marine Corps it will come as a blow, all the more surprising because the achievements of the Corps in Cuba and the Philippines since 1898 were supposed to have averted the danger of such action.

One of the first acts of the Continental Congress relating to the navy was that passed on November 10, 1775, before a single warship had been sent to sea, raising the "First and Second battalions of American marines." The custom of having marines was copied from the English service, with the exception that the Continental Congress required that the marines, especially the officers, should be good seamen. But the real function of the marines in both services was to act as police. The English navy, which then impressed its men mostly from the gutters of Portsmouth, Chatham, and Gravesend, was compelled to maintain a sea-soldiery in order to keep in order the desperate, unwilling ruffians who so frequently manned the ships of war. Indeed, only the rifles of the faithful marines prevented many a mutiny from coming to a head. Even in the great mutinies at Spithead, the Nore, and Bantry Bay the marines in the main stood firm. Lord Exmouth, with his marine guard, fought down the crew of the Impétueux, and as a result of this and similar displays of fidelity the title of "Royal Marines" was bestowed in 1802. This honor did not, of course, at all lessen the bitter hatred between the marines and sailors which is nowhere better illustrated than in the novels of Capt. Marryat.

In our own service the marines did well in all the early battles of the navy—indeed, they have always acquitted themselves creditably. In action they have been employed as riflemen, while

the sailors have fought the cannon. As policemen, they were, in the first half of the nineteenth century, of great usefulness. Indeed, when Commander Alexander Slidell Mackenzie of the brig Somers was tried for having hanged at sea, on December 1, 1842, three sailors, for an alleged attempt at mutiny, he defended his extreme measures by saying that, as "the Somers had no marines, a body of men distinct from the crew in organization and feeling, on whom, in ordinary ships of war, the police and discipline greatly depend, and who form a counterpoise and check to the turbulent spirits of the common seamen," he was compelled to adopt severe methods. He thus admirably summed up the functions of the marines. But as time passed and the *morale* of the crews improved, more stress began to be laid upon the purely military as opposed to the police functions of the corps. In the civil war the marines were chiefly serviceable for shore attacks, although even here they fought side by side with the sailors.

With the final passing of sailing vessels and the arrival of our modern floating fortresses, the opposition to keeping the marines at sea came to a head. Thus, in 1896 Lieutenant, now Commander, W. F. Fullam published in the November issue of the Proceedings of the Naval Institute an article advocating the precise action taken last week by President Roosevelt; and thereafter the two branches of the service were at swords' points until, in the excitement of the war with Spain, the issue temporarily disappeared. President Roosevelt's strongest argument for his action is the fact that all the more important European fleets, except the British, do not use marine infantry to police their ships, but rely upon their own sailors. Indeed, it is hard to see why this should not be the rule everywhere. Moreover, the disappearance of the fighting tops, and of the rifle as a weapon of offence—since ships in action never come within small-arms range of each other nowadays—makes it hard to find a *raison d'être* for the marine.

Whether the change in the duties of the marines will lessen their importance, time alone will show. They will doubtless be dubbed now the "navy-yard police," and will be contrasted to their disadvantage with the army. A movement to affiliate them with the regular troops will doubtless appear. The versatility of the officers and the mobility of the corps will probably suffer also.

CHINA AND HER RULERS.

Europeans in Peking believe that the death of the Emperor and the Dowager Empress will not be followed by serious public disturbance, though there may be various small outbreaks. China has the advantages, as well as the disadvantages, that come from great bulk. The death of a monarch cannot work the same effect on four hundred million Chinamen as on five million Portuguese. Chinese rulers especially, even when they reveal so strong a personality as that of the late Empress Tsu-Hsi, are largely swallowed up in their own august rôle. To the average Chinese taxpayer any Emperor will do, if he is only a son of heaven and remains properly concealed from his subjects. In the elevation of a new Emperor and the appointment of a Regent, the laws of blood and of the imperial succession seem to have been strictly followed; so on that score trouble is remote. Rumors of foul play, based on the almost simultaneous removal of Kwang Su and the Dowager Empress, were certain to be put into circulation; but thus far there is no evidence to sustain these reports.

If the late Empress was the virtual autocratic ruler of the Middle Kingdom for nearly fifty years, her authority suffered from the limitations that rest upon all autocracies. The despot who is seemingly so all controlling, is largely in the hands of the petty local tyrant who represents him. Russia is a standing example of the way in which a despot tries to do everything everywhere himself, and succeeds only in appointing so many scores of governors, who in their own provinces do what they please. Particularly in China, where the principle of provincial self-government has practically legal recognition, the power for good or evil exercised by the sovereign at Peking, is greatly circumscribed. When, therefore, the Empress Tsu-Hsi is spoken of as having held back China's advance in the ways of the West, or when her death is looked up as ushering in a period of rapid reform, we exaggerate both the importance of Chinese sovereigns and the rate of speed at which the Chinese people is capable of travelling. That rate has little commensurable relation with the output of imperial edicts at Peking.

The long ascendency of the Dowager Empress was interrupted in 1898, when the young Emperor, under the inspiration of radical advisers, startled China and the world with a rapid shower of reform edicts. The edicts began in the spring. In September there was a palace revolution; Kwang Su retired into his earlier obscurity; and the old Empress made a speedy end of reformers, reforms, and edicts. These events have been described as another instance of progressive movement and triumphant reaction. China is no exception to the laws of political progress; but it is to be remembered that the Empress had on her side the most powerful factor that reaction in any country can rely on—the danger of foreign aggression, whether real or imagined. It may have been mere coincidence that the game of European land-grabbing in China should have started about the time when the young Emperor began his personal rule. But, in any case, it was unfortunate that Germany should have determined to seize Kiau-chau in the winter of 1897, that Russia should have occupied Port Arthur, Great Britain Wei-hai-Wei, France Kwang-chau-wan, and even Italy should have come forward with some modest proposal of her own. Here was dismemberment threatening the Empire with the Emperor busying himself, in addition, by turning things topsy-turvy at home. The national interest, therefore, was supposed to demand the removal of Kwang Su.

But Empress Tsu-Hsi, though she set her face against the reformers and lent countenance to the reactionary elements, unwittingly helped the cause of progress. In fomenting the exasperated feeling against foreigners which culminated in the Boxer uprising, she only helped to bring about that closer contact with the Western world which she was presumably anxious to avoid. Dearly though China may have paid in blood and treasure for what the Boxers did in 1900, it is clear, nevertheless, that she has profited by the series of developments which have been the sequel to the Boxer upheaval. Russia's advance into Manchuria and her struggle with Japan have resulted in the present equilibrium in which China is reasonably safe from

territorial aggression. To the European nations which participated in the grisly Boxer carnival, that incident has proved also something of an awakening. The tendency to treat China as a corpse waiting for dissection has almost disappeared. The disposition to recognize that the Chinese people have rights other than that of buying Western print goods and illuminating oil, is perceptibly growing. China's new infant Emperor will probably attain a ripe old age before the much-talked-of national "awakening" is complete, but conditions in the Far East indicate that China will, at least, be given a chance.

THE NEW INDIA.

On the first of November fifty years ago the Calcutta *Gazette* published Queen Victoria's proclamation to "the princes, chiefs, and people of India." The document outlined a policy of English suzerainty, which, so far as words go, was definite and lofty:

> We desire no extension of our present territorial possessions; and, while we will permit no aggression upon our dominions or our rights; . . . we shall sanction no encroachment on those of others. . . . It is our earnest desire to stimulate the peaceful industry of India, to promote works of public utility, . . . and to administer the government for the benefit of all our subjects resident therein.

Reviewing the half-century during which this policy has been followed, King Edward declared a fortnight ago, in a message to the Viceroy: "We survey our labors with clear gaze and good conscience."

Nevertheless, at the very same moment, Calcutta was being terrorized by "political criminals"; public meetings were prohibited throughout the presidency; the government of Bombay was forbidding schoolboys to bring newspapers to school or to attend political meetings; assassins were attacking the lieutenant-governor of Bengal; and press censors from Simla to Ceylon were sitting up nights. This suggests a difference of opinion as to the success of English government; and the deference which Parliament and ministers are now showing toward the Indian Nationalist movement indicates at least the power, if not the reasonableness, of those who are seeking deliverance from a benevolent tyranny. King Edward's confession, in the message cited, that "the time has come when, in the judgment of my Viceroy and Governor-General, . . . the principle of representative institutions may be prudently extended," means much, in spite of its diplomatic hedging. To new India it signifies that her masters are at last aware of the impossibility of continuing their rule save by making concessions to that passion for self-government which their own schools and missionaries have been forming through the slow process of education. It also means that the humanitarians who have been acquiring such political influence in England are beginning to ask that the ryot receive the same consideration which is demanded for Irish tenant and Whitechapel laborer. How soon, the Nationalist wonders, will this changing attitude bring home rule?

English Socialists and kindred spirits are addicted to statistics, which they take very seriously. It is hard to believe that they will not turn to the India Blue Book some fine day and catch fire from the appalling figures there with which the Indian government calmly indicts itself. Physical conditions in tropical India and temperate Great Britain are so different, we grant, that comparisons of wages and expenses of subsistence are difficult and often misleading. But how can an Englishman who fights for an eight-hour working day and old-age pensions remain apathetic toward the Indian tax rate, which, according to the latest statistics, averages about $2 per capita, or one-third of the annual average income of each Hindu? How can he cry out against exploitation of slum-workers at home and keep silent on the unhappy native weavers driven by the thousands back to wretched farms? The increasing cost of living in London excites him; will the declining income and increasing cost of living in India be passed over? Official estimates show that the Hindu earned four cents a day in 1850; three cents a day in 1882; and, in 1900, after English rule had been given nearly a generation in which to prove its inestimable advantages, less than two cents. Not all the outward signs of railways, street lamps, municipal buildings, and schools, can hide the fact that these improvements have left the mass of the population whose taxes have created them still hungry and angry.

It is hardly surprising that reform programmes are being drafted. Parliament, as the Calcutta *Englishman* complains, would still rather devote a session to the suffragettes than to the great dependency; but a change is coming over English opinion. The old story about Oriental incapacity for self-government is no longer gospel; Japan has sadly damaged it. Army officers and statesmen here and there are making bold to say that the Tokio Parliament is not a whit better than a Hindu one might be. And the conservatives, who love to quote "East is East and West is West," are being shaken in their faith by the discovery that the Indian States under native rule are more prosperous, better educated, and quieter than the others. If such things are stirring consciences in England, how strongly must they be felt by 15,500,000 educated Hindus, who have seen China, Turkey, and Persia move toward freedom while they themselves have lagged?

BURDENS OF UNIVERSITY PRESIDENTS.

Discussing the impending retirement of President Eliot, one of the most prominent of the Boston alumni writes: "The governing boards and the alumni will understand better in six months than they do even now what a void Eliot will leave." But this is not merely because Mr. Eliot towers above all other college presidents and is so distinguished as a citizen. The magnitude of his office is such that it would be most difficult to fill, were it held by a man of far smaller intellectual calibre. The administrative work alone would tax the ability of our greatest heads of corporations, while the planning and steady maintenance of an academic policy that is liberal and progressive call for educational statesmanship of the first rank.

Time was, of course, when the president of Harvard, like the heads of our smaller colleges, could variously raise money, manage the funds, oversee expenditures, supervise the faculty, discipline the students, and guide the scholastic polity as well. But when an institution has grown to the size of Harvard, its president really needs a cabinet like that of the President of the United States. And what we here say of Harvard applies, *mutatis mutandis*, to Yale, Columbia, Cornell, Michigan, Chicago, and, indeed, all of our larger universities. The work of disciplining

the students, graduate and undergraduate, is entrusted to deans; a recorder or secretary supervises the complex labor of controlling the students, recording their absences, illnesses, and marks in examinations; a treasurer takes actual charge of the investments, and under him a bursar may deal with some of the details, such as the collecting of tuition fees. But even with these executive aids, the pressure of work upon the president is enormous. He presides at the meetings of seven or eight different faculties and many committees and boards. He is compelled to give much time to public utterances; to make long journeys in order to keep alive the interest of the alumni and secure their steady support; and on proper occasions he must present interestingly and convincingly the general and special needs of the institution. If he obtains a building, or a group of buildings, he must consider with some minuteness the architectural designs. He cannot wholly leave to the treasurer all financial questions, for his annual budget must be drawn up with a view to a rising or a falling income. If he is the head of Harvard, he is dealing with a capital of some twenty millions, with a yearly income from investments of about one million, to say nothing of other income, and he must be familiar with a treasurer's statement covering 148 printed pages. And every newspaper or magazine in the country thinks itself entitled to hear from him on public questions—if he is not giving a course of lectures in Berlin or serving on a commission at Washington or Tokio.

But this is not all. President Eliot's own report last year covered fifty-six printed pages and touched upon nearly fifty separate subjects, some of them of high importance, such as excess in athletic sports, admission with conditions, entrance requirements, the distribution of scientific students, and the moving of Andover Theological Seminary to Cambridge. The reports made to President Eliot from the various departments of the university, his own summary of the year, and the treasurer's statements make up a volume of no less than 500 pages.

In President Eliot's case, these multifarious burdens, including much attention to civic affairs, have been borne at the expense, we are almost tempted to say, of the students themselves. By this we mean no censure. It is a fact, however, that to the undergraduates he has often been a stranger, or at most a great name. Close relations with the students have been humanly impossible; all one could ask was the necessary intercourse with the leaders of the teaching staff of 566 persons. So when one of the undergraduates was asked by a reporter the opinion of the students as to the president's retirement, he naïvely answered that "few of us know him, but all regret the change." True, Mr. Eliot has for some years past met each newly entering class with one of his admirable addresses of counsel and inspiration. But beyond that the influence of his lofty personality has penetrated to the undergraduate hardly more than to the general public throughout the country. This has been a grave loss, for the moulding of character is, after all, the primary duty of a university; and in his generation no man has been better fitted than President Eliot to display, in close and intimate relations with youth, a noble example of unselfish service to a great cause.

Then there is the faculty. It takes a wonderful general to inspire 566 teachers; to recruit their forces, to recognize the worthy and discard the drones or the inefficient; to lead them on over the breastworks of tradition to new fields of honor and of service. That alone would seem a sufficient undertaking for any one man. And so we confess to some surprise on learning that not long ago a majority of a joint committee of the Overseers and the Corporation, including President Eliot himself, found, after inquiry, that "the president of the university does not need to be relieved of any function that he now performs; but that he ought to be relieved of details in many directions, and to have more assistance than he now has." Would they have been able to render the same report with any one else as president? Or it may be that for college presidents the ancient promise is phrased: As thy need so shall thy strength be.

THE NEW COPYRIGHT CONGRESS.

The International Copyright Congress which opened its sessions in Berlin on October 14, has just adjourned. Though its committee labors were in private, and the full text of the amendments which it has recommended to the Berne Convention for the protection of literary and artistic property has not yet been published, enough is known to make it sure that this congress has gone beyond that at Paris in 1896. There little was done beyond giving expression to pious wishes (*vœux*), which the gathering at Berlin has endeavored to fulfil. No less than thirty-five countries have been represented by some eighty-five delegates. The dispatches speak of "the American delegates," but, strictly speaking, there were none. The United States has not adhered to the Berne Convention. We have preferred to take our position with Turkey, Rumania, Ecuador, and other outside barbarians, though Japan has acceded to the Berne Convention, as one proof more of her desire to rank with civilized nations. As we still remain aloof, we were not entitled to representation at Berlin, and our "delegates" there must have been admitted only as friendly observers and reporters.

The chief purposes of the Berlin Congress were set forth by Prof. Albert Osterrieth, in his address at the first formal session. Lingering difficulties, ambiguities, and inequalities of copyright were to be discussed and, if possible, cleared up. The root idea of the Berne Convention was to give an author or artist the same protection for his property in a foreign country that he might have enjoyed as a native thereof. But in some cases this would mean a certain inequity. France, for example, grants copyright for the life of the author and fifty years thereafter. Hence an Englishman or a German, would get a more generous protection in France, than a Frenchman would in England or Germany, where the term of copyright is shorter. A similar inequality might arise as between Germany and England. The latter gives copyright for forty-two years from publication, while a German author's rights extend through his lifetime and thirty years after his death. It is not necessary to show what intricacies would present themselves in the copyright relations of all these countries, say, with Belgium and Italy. There has been a growing feeling that the Berne Convention, noble as it was in aim, did not guarantee justice to all the parties. Hence, the movement to make copyright laws uniform in all civilized na-

tions, so that there might be perfect equality of treatment. The arguments for such a course are set forth by Louis Delzons in the *Revue des Deux Mondes* of October first.

But it was with simpler matters that the Berlin Congress principally concerned itself. They may be grouped under the general head of "Art applied to industry." Here belong all the questions relating to photographic reproductions of works of art; to the mechanical production of music; to the appropriation of the plans of architects. The Germans, French, and Italians made also a special proposal for the protection of newspaper articles. It was admitted that they might be cited or discussed, but their entire reproduction or translation, without permission, was, it was contended, a violation of sound rules of copyright. The decision of the congress, it is stated, was to recommend that the use of political articles be permitted, unless expressly prohibited by the newspaper in which they appear; while scientific, historical, or literary articles should not be reproduced without express permission. On the question of the reproduction of copyright music by mechanical instruments, it is reported that a compromise was reached; everything already in use is to remain untouched, but new compositions cannot hereafter be taken without the consent of the copyright proprietor. Naturally, all these changes will have to be made, if at all, by legislative or diplomatic action on the part of the countries involved.

One object, or hope, of the Congress was to complete the circle of civilized states agreeing to the Berne Convention. Three great Powers have stood apart, all these years, Russia, Austria-Hungary, and the United States. Professor Osterrieth alluded, in his address, to the desirability of attracting these nations to the position which the other leaders of civilization have adopted. M. Delzons emphasizes the same point in his article in the *Revue*. And the dispatches say that the American delegates at Berlin agreed to recommend to their government that the United States join finally in accepting the Berne Convention. We wish heartily that this might be done. There is no other ultimate solution to the problem of international protection of the property made by men's brains. But we are bound to say that we see no hope of Congress being brought to so rational a step to remove our reproach among the nations. It could not even be got to deal fairly with the moderate measure of copyright reform urged upon it during the past two years. And if any man asks the reason why, the answer lies on the surface. The theory of our tariff laws is that the foreigner is not to be maintained in his rights, but to be attacked and pillaged. We must keep out his goods, or steal them if we can, be they coal and iron, or books and art. Even in the slight concession to decency, which was made in our international copyright act of 1891, it was necessary to introduce the odious phrase, "manufactured in this country," in order to placate the protectionists. It is the American protective system which has steeped the minds of the people and Congress in the notion that we must do nothing to the advantage of the foreigner, even if it be demonstrably to our advantage also. That spirit is it which has prevented, and will long prevent, we fear, the American Congress from approaching the question of international copyright in an enlightened way. Russia may go in with the rest of the civilized world, and Austria may; but the United States will continue, while our protectionists have their way, to line up with Turks and Montenegrins in the treatment of literary and artistic property.

A LITERARY MOVEMENT IN THE PHILIPPINES.

One of the most striking features of American occupation of the Philippines has been the stimulus given to native literature—using that word in its broadest sense. The movement is strong collateral evidence of the birth of a new spirit of nationality. For this result America may fairly claim a share of the credit; because, though the first phase was seen in the insurgent periodicals of 1898, they made their appearance after the Americans entered the city of Manila, and the old Spanish censorship of the press had broken down. The development of the Filipino periodicals since 1901-1902 has been notable. Almost to the end of Spanish rule, the printing-press was confined to Manila, though Cebú, Iloilo, and one or two other provincial and diocesan capitals saw the beginning of its work before 1898. During these past few years small periodicals have been started in over a dozen other provincial towns, and some have managed to keep going. The ablest and most independent of Filipino periodicals is *El Renacimiento*, a Manila daily printed in Spanish jointly with its Tagalog version, *Ang Muling Pagsilang* (a title which likewise means "The Rebirth" or "The Renaissance"). It has prospered so as to be able now to undertake also an English edition. This action, moreover, is a noteworthy sign of the times, as regards the passing of Spanish and the entry of English in the Philippine Islands; for the leading minds of *El Renacimiento*, men of Latin education and ideals, and in part also of Spanish blood, have been from the first hostile to "Americanization" and suspicious of our educational programme. It would seem, then, that our plan of building up the schools and extending the use of the English language is making appreciable headway.

But the literary movement is by no means confined to newspapers and periodicals. A Tagalog version of Schiller's "William Tell" has just been published, the text used being a hitherto inedited translation made by José Rizal when he was a student in Germany, over twenty years ago. Rizal's idea was, of course, to put within reach of his humbler fellow-citizens who could not read Spanish, the text of this drama of freedom—a work which, if accomplished, would have been another count in the Spanish charge against him as a revolutionist. The manuscript has been in the possession of Mariano Ponce, who is the editor of the little volume now published. This is the first of a series to be called the Filipino Popular Library—the project of some eight subscribers, including a German and an American (Dr. David J. Doherty), who have formed a society for the publication of works for general reading among the Filipinos. The second volume, "Poor Richard's Sayings," is now being translated into Tagalog. What would Franklin have thought could he have foreseen this translation and the conditions under which it is printed? The publishing house is the Libreria Manila Filatélica, which issues the "William Tell" at a cost of only 30 cents Philippine currency (15 cents gold). There are also two recent novels in Tagalog, published by the same concern: "Pinaglahuan," by Faustino Aguilar, and "Anino

nang Kahapon," by Francisco Laksamana. These volumes are the latest of ten Tagalog novels already on this firm's list, while in the past eight years many other pieces of fiction have been printed as continued stories in the Tagalog periodicals. These novels, which are put out in paper covers at a price of 60 cents Philippine currency, have considerable circulation, coming next in popularity to the various dramas in the native dialects.

Evidence in another direction of the effort among the Filipinos to create a national literature is to be found in their making the most out of what has been done by their compatriots in the past. Every scrap by or about José Rizal, whether valuable or not, is brought to light in the Filipino periodicals with a great surrounding apparatus of apparent erudition. The traces of writings by Filipinos in the earlier periods of Spanish rule, traces meagre enough and of little significance, are strung together to create the appearance of a "literature" that would be pitiful, were it not that the endeavor has its meaning and promise for the future. One of these earlier pieces of writing, however, which is not without merit, is the so-called poem in Tagalog, the "Florante" of Francisco Baltasar, a Tagalog versifier of the first half of the nineteenth century. His version of the Spanish fairy tale and knight's tale combined that goes under the name of "Florante" in the Philippines, has been regarded by his countrymen as far superior to any other version of the story, and has been called by competent Tagalistas, such as José Rizal, Marcelo del Pilar, and others, the best piece of Tagalog poetry in existence. Baltasar's memory has been revived in the Philippines of late, and he is being put in the post of "father of Tagalog literature." A new edition of his "Florante," with some of his other poetical writings in Tagalog and a study of his life, prepared by Hermenegildo Cruz, has been published by the Manila Filatélica under the title "Kan sino ang Kumathâ nang 'Florante.'"

Yet, as we have said, the significance of all these publications is less in the actual achievement than in the prompting impulse. It is the ambition for intellectual progress, the honor bestowed upon things of the mind, the search for light that really counts. For it is as true in the Philippines as in the most cultivated parts of America or Europe that he who seeks shall find.

FRANCIS THOMPSON.

I.

It was about the year 1897, when his "New Poems" appeared with an American imprint, that the name of Francis Thompson began to be rumored among us as a word of high esoteric meaning. At least that was the year in which he swam into my ken, in the form of a request to write some account of the new apparition. I was puzzled, I know, even a little baffled, by this "star-weary, overwarred" genius, and excused my inability in his own words:

> But here my lips are still.
> Until
> You and the hour shall be revealed,
> This song is sung and sung not, and its words are sealed.

Now, at last, the seal may seem to have been removed. Since his death last year at the age of forty-eight his two kindest protectors and warmest admirers, Mr. and Mrs. Wilfrid Meynell, have brought out a selection from his three books of poems, with a biographical note, and, at the end of the volume, a number of appreciations.* Well, shall I admit that I am still a little perplexed? I feel much in him that is great; I see him in the appreciations placed by eminent critics as an equal beside Donne and Herbert and Shelley and Wordsworth and Spenser and Milton; but I hesitate. Even in this residue from which all the dross of his work has supposedly been drawn off, there is still so much to harass the ear and tease the mind—uncouth words that simulate oracular frenzy, jagged edges of rhyme, harsh inversions, and gaping ellipses; so often his tortured language sounds like the beating on the ground of wings that cannot rise. He is of the wrestling but not of the triumphant spirits; of those upon whom the vision comes as an enemy, and who never, even when the victory is theirs, like the champions of Pindar, "go about the loud circle of applause, beautiful in youth and fair from fairest deeds."

II.

It may be that I am misled by the fallacy of carrying his life into his work. Of that broken life the main events are told by Wilfrid Meynell, with hints of its darker aspect. Francis Thompson was the son of a Lancashire physician and was himself trained for that profession at Owens College, Manchester. But literature seduced him, and, like De Quincey, he went to London, carrying for all his wealth "Æschylus in one pocket, Blake in the other." Like the Opium-eater, he carried also the taste that made his life in London's streets a visionary terror; and like him he met a strange and innocent rescuer:

> Once, bright Sylviola! in days not far,
> Once—in that nightmare-time which still doth haunt
> My dreams, a grim, unbidden visitant—
> Forlorn, and faint, and stark,
> I had endured through watches of the dark
> The abashless inquisition of each star,
> Yea, was the outcast mark
> Of all those heavenly passers' scrutiny;
> Stood bound and helplessly
> For Time to shoot his barbèd minutes at me;
> Suffered the trampling hoof of every hour
> In night's slow-wheelèd car;
> Until the tardy dawn dragged me at length
> From under those dread wheels; and, bled of strength,
> I waited the inevitable last.
> Then came there past
> A child; like thee, a spring-flower; but a flower
> Fallen from the budded coronal of Spring,
> And through the city-streets blown withering.
> She passed,—O brave, sad, lovingest, tender thing!—
> And of her own scant pittance did she give,
> That I might eat and live:
> Then fled, a swift and trackless fugitive.

The story thus hinted at has never, I believe, been told in print. It "surpasses in romance," says Mr. Meynell, "that of De Quincey's Anne, and might, indeed, for a moment, reverse Rossetti's just indictment of the life of 'Jenny'—'It makes a goblin of the sun.' For this 'flower fallen from the budded coronal of Spring' took root and flourished, even in London mire, and again the fragrant petals unfolded and the greenery grew."

But the true help for Thompson came from Mr. and Mrs. Meynell themselves and was more far-reaching than the modesty of the biographer permits him to record. In their home, the poet found a refuge; to their child daughter were written the poems, wistful with jealousy of the future, when only by the remembrance of these verses he should share the possession of her heart with the destined lover:

> But on a day whereof I think,
> One shall dip his hand to drink
> In that still water of thy soul,
> And its imaged tremors race
> Over thy joy-troubled face,
> As the intervolved reflections roll
> From a shaken fountain's brink;

to his adored benefactress were dedicated the lines "Before Her Portrait in Youth," in which all the ravages and abstinences of a dispossessed life unite in a passionate claim upon the past:

> So I, in very lowlihead of love,—
> Too shyly reverencing
> To let one thought's light footfall smooth
> Tread near the living, consecrated thing,—
> Treasure me thy cast youth.

Selected Poems of Francis Thompson. New York: John Lane Co. $1.50 net.

This outworn vesture, tenantless of thee,
Hath yet my knee,
For that, with show and semblance fair
Of the past Her
Who once the beautiful, discarded raiment bare,
It cheateth me.
As gale to gale drifts breath
Of blossoms' death,
So dropping down the years from hour to hour
This dead youth's scent is wafted me today:
I sit, and from the fragrance dream the flower.

III.

From these songs of surrendered love, whose concentrated emotion can only be perceived from repeated reading in their complete form, it is but a step to the poems of Catholic mysticism, upon which his greater fame depends. They are all in praise of asceticism, yet with troubled reserves. As in his love there is no entire forbearance of the fruits of time, but an attempt to subtilize the flesh by waiving the alien present for some shadowy and morbid possession of the past and future, so one can never be quite sure how far his ecstasies of faith are a victory of the will and how far mere *défaillances* of a degenerate body. There are notes that rise like spiritual triumphs in his works, lines like those quoted by Mr. Quiller-Couch in his appreciation:

Firm is the man, and set beyond the cast
Of Fortune's game, and the iniquitous hour,
Whose falcon soul sits fast,
And not intends her high sagacious tour
Or ere the quarry sighted; who looks past
To slow much sweet from little instant sour,
And in the first does always see the last.

But these do not seem to me to express so intimately the poet's own experience or to ring so true to the reader as the passages of a more ambiguous turn. And I am confirmed in this opinion by the curious twisting of logic in a little prose treatise on "Health and Holiness," which was the result of his temporary retreat in a monastery. In one place he quotes Luther's *pecca fortiter*, and thinks that "he that sins strongly has the stuff of sanctity, rather than the languid sinner," yet as a whole his argument would appear to be that in the lowering of physical vitality, which he transfers from himself to his generation, there is a corresponding growth in spirituality:

No less, looking largely back over human history, I discern in her [Nature] a pertinacious purpose to exalt the spirit by the dematerialization (if I may use the phrase) of the body. Slow and insensible, that purpose at length bursts into light, so to speak, for our present eyes. For all those signs and symptoms, upon which I have insisted even to weariness—however ill from the mere material standpoint, what do they mean but the gradual decline of the human animal, the gradually ascending supremacy of the spirit on the stubborn ruins of the bodily fortress?

It is natural that the editors of the Selection should have shown little of this wavering between heaven and earth, yet no one can rightly understand Thompson who has not followed him in the agony of doubt in such excluded poems as "The Dread of Height":

But ah withal,
Some hold, some stay,
O difficult Joy, I pray,
Some arms of thine,
Not only, only arms of mine!
Lest like a weary girl I fall
From clasping love so high,
And lacking thus thine arms, then may
Most hapless I
Turn utterly to love of basest rate;
For low they fall whose fall is from the sky.
Yea, who me shall secure
But I of height grown desperate
Surcease my wing, and my lost fate
Be dashed from pure
To broken writhings in the shameful slime:
Lower than man, for I dreamed higher,
Thrust down, by how much I aspire,
And damned with drink of immortality?

That note may be found in the accepted saints, no doubt, yet with a difference. There is in the "Imitation" the story of one who, under similar stress of fluctuating hope and fear, prostrated himself at the altar, with the cry: "Oh, if I knew that I should still persevere!" But immediately he heard within himself the divine response: "If you knew this, what would you do? Do now what then you would wish to do, and you shall be secure." One finds in Thompson no such assurance that spiritual comfort is based on a healthy common-sense. His distress is aggravated at once by the impatience and uncertainty of his faith, impatient in its clamor for the heavenly rapture, uncertain whether this rapture is to be obtained by a repudiation of the flesh or by "that embrace of body and spirit, Seen and Seen," as he calls it, "to which mortality, sagging but pertinacious, unalterably tends." The most extraordinary of his poems, artistically, that "To the Dead Cardinal of Westminster," takes this ambiguity frankly for its theme. In quick, exclamatory stanzas, whose rhythm hesitates with a kind of palpitating suspense, he addresses his prayer to the spirit now emparadised:

Anchorite, who didst dwell
With all the world for cell,
My soul
Round me doth roll

A sequestration bare.
Too far alike we were,
Too far
Dissimilar.

For the poet who worships beauty, like the priestly servant of God, sees everywhere in life a coquetry of Death, a tiring-room for the trying of Death's various garments; he has in recompense his own proud avocation from the world:

He lives detachèd days;
He serveth not for praise;
For gold
He is not sold.

But to the priest comes no such rending doubt as pierces the heart of one who has lost his life for the "impitiable Dæmon, Beauty." Nowhere in modern verse, scarcely in any verse, shall you hear words of more real terror of spirit than this cry of the poet to his friend in heaven:

Call, holy soul, O call
The hosts angelical,
And say,—
"See, far away

"Lies one I saw on earth;
One stricken from his birth
With curse
Of destinate verse.

"What place doth He ye serve
For such sad spirit reserve?
. . . . . .

"Can it he his alone.
To find, when all is known,
That what
He solely sought
"Is lost, and thereto lost
All that its seeking cost?
That he
Must finally,

"Through sacrificial tears,
And anchoretic years,
Tryst
With the sensualist?"

IV.

Something of this same terror, the fear of one to whom the vision appears as a flaming, awful sword threatening to sunder spirit from flesh, but enlarged now to embrace the experience of mankind, enters into the inspiration of Thompson's great poem. That ode, partly, no doubt, through the alliterative suggestion of its title, "The Hound of Heaven," has attained already a kind of popularity, yet it would be unsafe to assume that even its opening lines are known to the reader:

I fled Him, down the nights and down the days;
I fled Him, down the arches of the years;
I fled Him, down the lahyrinthine ways
Of my own mind; and in the mist of tears
I hid from Him, and under running laughter.
Up vistaed hopes I sped;
And shot, precipitated
Adown Titanic glooms of chasmèd fears,
From those strong Feet that followed, followed after.
But with unhurrying chase,
And unperturbèd pace,
Deliberate speed, majestic instancy,
They beat—and a Voice beat
More instant than the Feet—
"All things betray thee, who betrayest Me."

The idea of these lines is evidently conceived from a union of Æschylus' Erinnys, that, like a hound (ὡς κύων) follows its prey until he come under the earth, where even dead he is not all free, and the language of the Psalmist: "Whither shall I go from thy Spirit? or whither shall I flee from thy pres-

ence? If I ascend up into heaven, thou art there: If I make my bed in hell, behold, thou art there." Yet the effect is in nothing borrowed or secondary. Here, at least, thought and image, emotion and rhythm, are in liberated and mighty accord, and the result is a stanza which pulses in the memory like the sound of a bell swaying amidst a waste of obscure waters. Those few lines alone are a complete poem, magnificent enough to make a singer's fame. Indeed, I am not sure that the following stanzas are entirely in harmony with this opening, that they do not a little dissipate the initial impression. They are, in part, a legitimate expansion of the general idea: the poet tells of seeking refuge in human love, in the innocence of childhood, in the secrecies of nature, only to be baffled and routed everywhere by the insistence of the divine pursuer. That is well; but it is not well that the metaphors should sink at times into frigid conceits, and it approaches a kind of treachery to the confiding imagination when the sense of impetuous motion is lost in the abundance, however splendid, of stationary description. With a few excisions, and with a little more loyalty to the guidance of the titular theme, I feel that the poet might have created, what an admirer calls it, "one of the very few 'great' odes, of which the language can boast"—I should say that, even as it stands, he had so succeeded, were it not for the concluding lines:

> Halts by me that footfall:
> Is my gloom after all,
> Shade of His hand, outstretched caressingly?
> "Ah, fondest, blindest, weakest,
> I am He Whom thou seekest!
> Thou dravest love from thee, who dravest Me."

Others may be affected differently, but I cannot accustom my mind to this inversion of the metaphor from one who seeks refuge against a pursuer to one who unwittingly drives away what he seeks; nor can I convince myself that the change is quite justifiable from the Oriental, rather the truly catholic, inspiration of the opening to the more narrowly Catholic note of the close. Here is a metamorphosis of the Furies into Eumenides, with a vengeance. Would not the impression have been at once more consistent and more powerful, had the poet maintained to the end his image of the pursuing hound, shadowing thus the alarms of some infinite ineluctable enemy that break into all the enjoyments and concerns of the world? The tone of the climax should have been only a deepening of that which was first struck; or, if any reconciliation were necessary, it should have been through some half-allowed glimpse of the mystic truth: "When me they fly, I am the wings." It may be presumptuous thus to reconstruct in idea a poem at all accounts so magnificently imagined, but really this is nothing more than a distinguishing between the two voices that speak in the same ode: one the voice of the poet's heart, tremulous with fear of its own ecstasy; the other that of the prescribed and beneficent peace of the saints.

V.

Those who place Thompson in the immediate company of the Caroline poets, will not, perhaps, accept such a distinction; but I cannot quite see that relationship. Something of Donne he may have, a little less of Herbert, of the free, more elastic singers of that religious age, Vaughan and Traherne and Marvell and Milton, in whom is all the exultant music of the dawn—scarcely a note. Only with the ascetic Crashaw, who stands apart from the main line, the kinship is marked. He is free from the execrable gust for blood, which makes a good deal of Crashaw almost revolting to a healthy mind, but the other faults of taste he shares with Crashaw, and even exaggerates. In both there is the same breath of the prison house, something close and febrile and spiritually exacerbating.

His real affiliation is rather with the line of poets and visionaries of the nineteenth century, who have combined a worship of heaven with subjection to the angel of the darker drink—Coleridge and De Quincey, Poe and Clarence Mangan, and, nearer to his own age, the ill-starred James Thomson. More particularly one cannot read "The Hound of Heaven," without remembering how De Quincey saw the images of his dream swell and swoop upon him, and is forced unpleasantly to consider the cause. Still closer to him in point of time, are those finely wrought poets, Lionel Johnson and Ernest Dowson, who, like him, looked to Rome for their faith. Whether it be from morphine or absinthe or alcohol, there is in each of these three, the suspicion that their cloistral abstinence is doubled with a physical taint. Johnson and Thompson differ profoundly in their sense of form and style, the former being as classical and restrained in his taste as the latter is romantic and lawless; but both write with the same straining hope that out of a renunciation half-voluntary and half-compelled by the enfeebled body, there shall come in the end the peace of an infinite salvation. The agony is more poignant, if expressed with more reserve of language in Johnson, and the victory is also more philosophic, if less lyrical:

> Dark angel, with thine aching lust!
> Of two defeats, of two despairs:
> Less dread, a change to drifting dust,
> Than thine eternity of cares.
>
> Do what thou wilt, thou shalt not so,
> Dark Angel! triumph over me:
> Lonely, unto the Lone I go;
> Divine, to the Divinity.

The kinship with Ernest Dowson, the decadent singer of the London slums and the Parisian asphalt, might seem too slight to bear analysis; yet Dowson was not without his abstinence, which took the form of an æsthetic fragility and purity of touch. Through all the dissipation of his life the memory of the one true love—"I have been faithful to thee, Cynara! in my fashion"—remains like a mystic purgation of the soul. It is at least a curious coincidence that he, too, has his child-love, although with renunciation rather than jealousy of the future:

> Little lady of my heart!
> Just a little longer,
> Be a child: then, we will part,
> Ere this love grow stronger.

Nor is the "Amor Umbratilis" wanting, with its pathetic adoration of what the world has reserved for stronger hands:

> Yea, for I cast you, sweet!
> This one gift, you shall take:
> Like ointment, on your unobservant feet,
> My silence for your sake.

VI.

These are but hints to divine the secret of a soul I do not pretend to measure. Who shall untangle the threads of such a life, and say that this peace is born of faith's vision and this ecstasy is wrung from the body's defeat? Who shall declare how much of this personal anguish in the struggle is due to the tyranny of Catholic images and how much to troubled nerves? It is safer to hold fast to the simple assurance that, in spite of all questioning and far beneath all morbid accretions, if such there be, lay in this poet a fund of religious conviction, a real and incalculable power, springing from sources not bare to the world. Among his papers when he died was found this unfinished descant on the text of the Bible, "The Kingdom of God is within you":

> O world invisible, we view thee,
> O world intangible, we touch thee,
> O world unknowable, we know thee,
> Inapprehensible, we clutch thee!
>
> Does the fish soar to find the ocean,
> The eagle plunge to find the air—
> That we ask of the stars in motion
> If they have rumor of thee there?
>
> Not where the wheeling systems darken,
> And our benumbed conceiving soars!—
> The drift of pinions, would we hearken,
> Beats at our own clay-shuttered doors.
>
> The angels keep their ancient places;—
> Turn but a stone, and start a wing!
> 'Tis ye, 'tis your estrangèd faces,
> That miss the many-splendored thing.
>
> But (when so sad thou canst not sadder)
> Cry;—and upon thy so sore loss
> Shall shine the traffic of Jacob's ladder
> Pitched betwixt Heaven and Charing Cross.
>
> Yea, in the night, my Soul, my daughter,
> Cry,—clinging Heaven by the hems;

And lo, Christ walking on the water
Not of Genesareth, but Thames.

Belief in a present deity is not so common in these latter days that it can be ignored or belittled; it makes the substitute of human charity heard in many a Protestant pulpit seem in comparison like a poor hypocrisy. For so much we must thank the Catholic poet and his editors. P. E. M.

ITALIAN SOCIETY FOR THE PROGRESS OF SCIENCE.

Florence, November 1.

If consciousness of a great past and of noble inherited tendencies can stimulate, the choice of Florence for the second annual congress of the Società Italiana per il Progresso delle Scienze must have strengthened the zeal of every member. And no single Florentine monument could better recall the capacity for leadership, vigorous imagination, mechanical skill, power of sustained effort, and love of intellectual pursuits which in generous measure have characterized the Italian people, than the Palazzo Vecchio, where the opening exercises were held. In his inaugural address Senator Pietro Blaserna, the aged professor of physics in the University of Rome, discussed the "Condition of Experimental Science in Tuscany in the Seventeenth Century." Other addreses were made by the Minister of Education, by Prof. Vito Volterra, president of the society, and Prof. Giulio Fano, head of the local committee. Minister Ravà spoke of the intense scientific activity in Italy as the most important sign in the history of the last ten years of national life. He referred to the complete edition of the works of Galileo, which has been published by the state. The government has also begun an edition of Volta's works, and has assisted the town of Faenza to print the works of Torricelli. Senator Volterra referred to the tendency in this society to place pure science in contact with its applications, and noted the interesting fact that already many important industrial societies and prominent manufacturers have recognized the material advantages springing from the activities of this organization, and have given it their cordial support. Professor Fano recognized a sentiment now prevalent in Italy when he claimed the sympathy of all classes of citizens because this society's ideal is to exalt and develop the conviction in the national consciousness that "science is the most powerful agent of all material and moral progress, since, being free from all dogma, it welcomes them all in order to investigate them, and does not pretend to represent the truth, but the incessant and progressive search for it."

A reception followed these addresses, during which the apartments of Eleanor of Toledo and the Quartiere degli Elementi were opened. Until recently these rooms have been used for storage or offices, but are now being restored so far as possible to their condition when occupied as private apartments by the Medici. The frescoes by Vasari and his pupils have been carefully cleaned, but not retouched; the walls of several rooms were originally hung with tapestries designed for them. These tapestries have been scattered, but some, long in the Uffizi Gallery, have been replaced in their original positions, and others will doubtless be returned. The delicate coloring and grace of a fine but neglected Botticelli has been made evident by skilful cleaning; and, with other interesting easel pictures, will be accessible to the public when these changes are completed and all the rooms of the second floor are opened.

Many of the papers offered at the working sessions were too technical to be reported here in any detail. In the Archæological Section Prof. Luigi A. Milani, director of the Archæological Museum at Florence, spoke on the "Resemblances and Differences between the Italiots and the Etruscans." His address, in the opinion of such specialists as Pigorini, Pernier, and Pasqui (recently appointed director of excavations at Rome), is a notable addition to our knowledge of the earliest Italian races. The Etruscan material of the early iron period exhibits analogies with that of the same period in the Emilia and the Veneto, especially in the methods of disposing of the dead in urns of the Villanovian type, and in objects placed in the tombs; but the differences and new elements are sufficiently marked to indicate a transformation of the Italiot civilization under the direct influence of another people of wholly different civilization, distinct customs, artistic expression, and religion. In developing his argument, Professor Milani made use of the rich resources of his museum and the most recent discoveries in Crete. He laid stress especially upon the ovoid and spherical receptacles for the remains of the dead; the *canopi* (cinerary urns bearing portraits of the deceased), which he regards as allied to Oriental death-masks; upon other urns found only in Etruria and Latium which are unlike the Villanovian type and imitate thatched huts, houses, shrines, and temples, and resemble forms recently excavated in Crete; upon bronze covers in the shape of pileated and crested helmets and their earthen imitations; and upon covers shaped like round or oval shields—all forms which originally were peculiar to the earliest Etruscan sepulchres. The discovery of pre-Hellenic seals in Asia Minor, bearing the image of Sabekh, the warrior god of the Hethei, and the seal found at Vetulonia, no longer permit doubt as to the connection between the helmet with a crest or apex or priest's mitre and the cult of the Kureti or Cretan Dattili, or as to the introduction into Etruria in the most remote times of this mysterious pre-Hellenic cult, which runs back to the bronze age and belongs specifically to Ægean civilization. The conical shields typical of the Cretan Kureti are analogous in form and use to those discovered at Vetulonia and at Gassofortino, and to the twelve sacred shields trusted to the care of the Salii of the Palatine and Quirinal. Characteristic changes in methods of burial also point to the conclusion that, at a certain point in the development of Italiot civilization, a people who brought the Dattilic religion of the Ægean and that civilization which existed in Greece and Crete in the pre-Hellenic period, must have established themselves in Etruria. Evidence that the Etruscans originated in Asia Minor is furnished strikingly by the bark found in the tomb of the Duce at Vetulonia and by three *stelæ* in the museum at Florence, the Aulo Elusukes of Vetulonia, the *stelæ* of Larthi Aninies found at Fiesole, and that of the warrior Larthi Atharnies from Pomarance.

In the same section the papers by Dr. Luigi Pernier of Florence on the "Latest Excavations at Festo" and the "Archaic-Greek City of Prinià in Crete," by Cavalier Angiolo Pasqui of Florence on the government excavations which he has recently conducted at Monteleone, near Spoleto, and Dr. Giorgio Karo's report of the "Explorations of the German Archæological Institute in Pylos," incidentally gave unexpected confirmation to Professor Milani's argument on the Etruscans. Prof. Antonio Taramelli of Cagliari gave a vivacious account of six years spent in investigating the primitive civilization of Sardinia. Signor Taramelli's papers will be published in the Orientalists' review, *Memnon*, and Signor Pasqui's in the *Notizie degli Scavi*, issued by the Accademia dei Lincei. Prof. Luigi Pigorini, whose semi-centennial of academic service was celebrated at Parma immediately after the close of this congress, spoke on the "Civilization of Etruria during the Bronze Period of the Lake-dwellers of the Terramare," which awaits new excavations for an adequate solution of its problems. The section voted to ask the government to grant the necessary staff of assistants and the funds to carry out the plan which Professor Milani has already formulated. It voted also in favor of the extensive exploration of prehistoric fortifications of the type studied by Professor Pasqui near Spoleto.

History has been recognized as a science and given a section under the presidency of Prof. Isidoro del Lungo of Florence. The sessions included a paper by Prof. Guido Biagi of the Laurentian Library on the "Papers of the Florentine Inquisition in Brussels"; an

account by Cavalier Domenico Tordi of Florence of a fragment of a commonplace book now in his possession, the "Libro della Tavola di Riccomanno Jacopi," a relative of Dante, which is valuable for the information it supplies of the domestic life of the time of Dante; a paper on the *epistolario* of the Venetian humorist, Ludovico Toscarini, and another indicating the fund of valuable historical information which Prof. G. B. De Toni of Modena discovered hidden in the 300 volumes of letters written by Ulisse Aldrovandi when searching them in an effort to fix the date of the celebrated Herbarium. Prince Caetani di Teano of Rome described the methods he is employing in compiling an Italian Bio-bibliographical Dictionary. Most welcome of all to foreign students were the vigorous resolutions passed by this section and afterwards approved by the whole society, demanding immediate legislation to secure the proper care and arrangement of the manuscripts and documents now in the state archives and libraries and in semi-public institutions throughout Italy, and to render them more accessible to properly qualified students.

In still other sections problems of abstract science received due attention; many papers were directed to the investigation, development, or protection of the natural resources of Italy; and still others pointed to educational reforms. A few of the titles may indicate more specifically the scope of the congress. Senator Giuseppe Colombo, professor in the University of Milan, reviewed the effect of the development of gasolene engines on problems of transportation; Senator Emanuele Paternò, professor of chemistry at Rome, described the "Origin and Development of Crioscopy"; "The Relations of Physical-Chemistry with the Biological Sciences" was presented by Prof. Giuseppe Bruni of Padua, from the point of view of chemistry; by Prof. Romualdo Pirotta of Rome, of vegetable biology; and by Prof. Filippo Bottazzi of Naples, of physiology. Prof. Elia Millosevich of Rome discussed "The Direction of Modern Astronomical Research"; Prof. Felice Tocco of Florence, "The Philosophical and Physiological Aspects of the Conception of Space," and Prof. Antonio Garbasso of Genoa, "The Structure of Atoms of Matter."

There were interesting special exhibitions of Galilean manuscripts in the National Library, of the chief tracts of Evangelista Torricelli in the state archives, and of scientific works of the time of Galileo in the Laurentian library; and the Museum of Ancient Instruments opened for permanent exhibition at this time. For one day the congress adjourned to Faenza, commemorating the tercentenary of the birth of Torricelli with an address by Prof. Andrea Battelli of Florence and the attendance of representatives of the leading universities of Europe. A. H.

NEWS FOR BIBLIOPHILES.

In commemoration of the three hundredth anniversary of the birth of John Milton on December 9, an exhibition of early editions and portraits has been prepared at the Lenox Library in this city. The item of chief interest is probably the first edition of "Paradise Lost." The Lenox Library has nine copies, dated from 1667 to 1669, with variations in the title-pages. The second, third, and fourth editions are displayed, as well as remarkable later issues and critical pamphlets on the poem. "Paradise Regained" also is well represented. Several of Milton's early prose works deserve mention. The "Eikonoclastes" and the first and second "Defensio," in which he defends the people in executing Charles I, are shown, together with the proclamation of Charles II, in 1660, calling in and suppressing them. Three other well-known prose works are: "Doctrine and Discipline of Divorce: Restor'd to the good of Both Sexes," etc., 1643; "Tetrachordon: Expositions upon the foure chief places in Scripture which treat of Mariage, or nullities in Marriage," 1645; and Areopagitica," the plea for unlicensed printing. The Lenox Library is fortunate in possessing three books bearing Milton's autograph. One is "Rime et prose di M. Giovanni della Casa," Venice, 1563; "La Vieux Natura Brevium" bears the inscription: "Joh'es Milton me possidet," while Rosse's "Mel Heliconium," 1646, has, on the verso of the title, an original signed sonnet in the poet's handwriting. Next to these is displayed Cooper's "Thesaurus Linguæ Romanæ et Britanniæ," London, 1573, which the finder, Collier, says was Milton's. It contains over 1,500 manuscript additions and corrections which are said to be the poet's, but of this there is no positive proof. Of undoubted authenticity is the Latin letter to Carlo Dati, 1647. It is a single folio leaf, closely written, and much stained and frayed by time. In the adjoining cases, the Print Department has arranged about 150 portraits. The first engraved picture of Milton appeared in the first edition of his poems in 1645. Beginning at the age of ten, these pictures purport to show his appearance with advancing years, although in fact they are all derived from five or six portraits made during his lifetime.

A few years ago some zealous student of Thoreau made the discovery that three lines were omitted at the bottom of page 396 of the first edition of his first book, "A Week on the Concord and Merrimack Rivers," and that these lines were supplied in the 1868 addition. The proof-sheets of the first edition, recently discovered in Concord and acquired by S. H. Wakeman, show that the lines were in the proof when passed upon by Thoreau, but were thrown out by the printer. As printed in the proof there is no space between lines 21 and 22. On the margin Thoreau has indicated a dash and has written "3 more white lines" and at the bottom of the page "I must have indicated that more space was wanted here." What the printer did was to supply the three "white lines" and, instead of passing the three lines of text on to the next page, simply threw them out. A complete set of "page-proofs" of the book, from title to advertisement leaf, have corrections by Thoreau on almost every page. It is interesting to note that the copyright date is 1848, though the date in the imprint is 1849. In the printed book both are 1849. The proof-sheets of "Walden," discovered at the same time, were, we are informed, sold to W. K. Bixby of St. Louis, who is the owner of the manuscript of that book.

On November 27 and 28, Stan. V. Henkels sells in Philadelphia, Part VII of the library of ex-Gov. Samuel W. Pennypacker. This part, 1,357 lots, is made up almost entirely of books and pamphlets printed at Philadelphia and Germantown. The collection of issues from the press of Robert Bell is said to be the most complete ever brought together. Bell reprinted many English works such as Goldsmith's "Traveller," 1768; Johnson's "Rasselas," 1768; Robertson's "History of Charles V," 1770; "Paradise Lost" and "Paradise Regained," 1777; Thomson's "Seasons," 1777; Young's "Night Thoughts," 1777, and others, and these first American editions are often rarer than the actual first editions. Besides his reprints, Bell published many American books, two of the more interesting being "The Battle of Bunker Hill," 1776, and "The Death of General Montgomery," 1777, by Hugh H. Brackenridge, each with an engraved frontispiece by Norman. These frontispieces are usually lacking. The collection of books from the press established by the Seventh Day Dunkers at Ephrata in Lancaster County is also the most extensive ever brought together, no other copies of several of the volumes being known. The earliest imprint of this curious press was the "Guldene Aepffel in Silbern Schalen," issued in 1745. The Dunkers' most famous book, the largest issued from any American press before the Revolution, was the so-called "Martyr Book," "Der Blutige Schau-Platz oder Martyrer Spiegel," 1748. There is one book from William Bradford's first press, "Some Reasons and Causes of the Late Separation that hath come to pass at Philadelphia," 1692, and from his New York press "Christelijcke Religie Voorgestelt," 1700, the first Dutch book printed in America. There are also Early Philadelphia almanacs, a New Testament of 1780 and one of 1781, and some school-books.

Several rare and important collectors' items are included in C. F. Libbie & Co.'s sale in Boston, November 23, 24, and 25, chief among them a copy of Whittier's "Moll Pitcher," 1832, in the original blue paper covers, and Poe's "Tales of the Grotesque and the Arabesque," 2 vols., 1840, a presentation copy to "Miss Anna and Miss Bessie Pedder." Other interesting lots are Penhallow's "Wars of New England with the Eastern Indians," 1726; the first edition of Molina's "Vocabulario" in Spanish and Mexican, 1555, one of the most sought for of early Mexican imprints, but unfortunately imperfect; and the first edition of Trumbull's "Indian Wars," Brooklyn, 1809, the title-page of which reads "By the Rev. James Steward, D.D."

On November 23 and 24 the Anderson Auction Co. of this city offers selections from the private library and stock of C. L. Ricketts, a Chicago bookseller. First editions of George Eliot, Leigh Hunt, Rich-

ard Jefferies, Andrew Lang, and others; and books on book-binding and bibliography are the more notable lots. On November 25 the firm sells an English consignment of miscellaneous books, including first editions of Charles Lever. On November 27, the Anderson Co. will sell some autographs, partly from the collection of the late John Davies of Brooklyn. There are letters of Longfellow, Stedman, Thomas Hardy, Dickens, and Cooper; and manuscripts of Thomas Hardy (25 pages); Sir Edwin Arnold (17 pages), and others.

Sotheby, Wilkinson & Hodge will sell in London, on November 26 and 27, the library of W. Trehone Pellow of Southampton, including first editions of Ainsworth, Dickens, Leigh Hunt, Keats, Lever, Ruskin, Tennyson, and Thackeray, and books illustrated by Alken, Cruikshank, and Rowlandson.

At Sotheby, Wilkinson & Hodge's, on November 2, the series of sixty-seven autograph letters of Sir Walter Scott to Charles Kirkpatrick Sharpe brought £155; the collected set of first editions of Dickens's works, £215; Cruikshank's "Fairy Library," containing twenty-four India proofs, with autograph inscription on each, and eight of the original drawings, £147; the second edition of Burns's "Poems," with several of the names filled in in the poet's autograph, £20.

At an auction at Puttick & Simpson's, London, in the week ending October 31, A. and C. Tennyson's "Poems by Two Brothers," 1827, first edition, large paper, brought £29; Shakespeare's "Poems," 1640, £91; Shelley's "St. Irvyne," first edition, £26; "The Cricket on the Hearth," first edition, presented to Victor Hugo, £22; Florio's Montaigne, 1603, first edition, original vellum, £65.

The most valuable item in the Bryant sale at Anderson's, in this city, on November 5, the presentation copy of "Tales of a Wayside Inn," with inscription "William C. Bryant, with best regards of the author," in Longfellow's autograph, brought $125. Some of the other prices were: Bryant's own copies of his "Poems," New York, 1832, $37; his own copy of his translation of the Iliad, $50; the copy of the Iliad which he gave to his daughter, $27; his copy of "Hiawatha," $27; many less interesting books with Bryant's autograph sold for from $1 to $5. At the sale of the Hillis library, November 12, Thackeray's "Second Funeral of Napoleon," first edition, an uncut copy, brought $375.

The copy of Cotton Mather's "Wonders of the Invisible World," Boston, 1693, announced for sale at Libbie's on November 12, proved to have the title-page and two other leaves in facsimile. It was "bought in" at $100.

The John Carter Brown library, Providence, has just published (two hundred copies, printed at the Merrymount Press) a facsimile of the first issue of the *Gazeta de Lima*, with a description of the library's file for the years 1744-1763. The numbers of this little newspaper generally consisted of four leaves, the type-page measuring 6½ by 4 inches. From announcements in this newspaper G. P. Winship, the librarian, has been able to select the titles of twenty-four publications not mentioned in Medina's "Imprenta en Lima."

Correspondence.

A "PHYSICIAN OF THE SOUL" SEVENTY YEARS AGO.

To the Editor of The Nation:

Sir: Nothing is more surprising in the controversy now raging over the proposed "Healing Mission" than the implied assumption that there is anything new in the spiritual or religious treatment of disease, notably of minor or functional forms of nervous ailment. Physicians are quite competent to defend their position as against amateur practitioners of psychotherapy, but I have failed to notice in the various letters commenting on the Rev. Dr. L. W. Batten's prospectus of the work of "St. Mark's Healing Mission" in this city any allusion to the fact that exactly seventy years ago there appeared in Vienna a little book, "Zur Diätetik der Seele" (The Hygiene of the Soul), by a psychologist and physician of the first rank, whose teachings have become part of the common stock of knowledge of every practising neurologist in the world, even if they have not as yet penetrated into clerical quarters. The author of the book, Ernst Baron von Feuchtersleben, may indeed be regarded as one of the principal founders of the modern science of psycho-therapy, inasmuch as he occupied the first chair of that subject in any German university (he received his appointment in Vienna in 1844), and was the author of an important work on the treatment of diseases of the mind ("Lehrbuch der ärztlichen Seelenkunde"), which was translated into English by two distinguished London physicians, and long remained the standard text book on the subject.

Feuchtersleben's permanent rank in literature rests, however, on his "Hygiene of the Soul," which has become a German classic, and is being constantly reprinted, having reached probably more than fifty editions. It has never, however, been translated into English. Feuchtersleben defines the term "Hygiene of the Soul" as "that power of the mind which enables the body to ward off threatening evils—a power whose reality can hardly be denied, whose oft-told miracles have filled us with astonishment, but whose laws have rarely been inquired into, while its manifestations have still more rarely been called forth as an agency for practical good." Feuchtersleben goes further than Kant, who, in his well-known treatise on the emotions, speaks of the ability to conquer morbid feelings by sheer will power. He would not only master such feelings, but, wherever possible, prevent sickness itself, and in doing so he insists that the mind or soul must aid the body. It is not his intention to seek "the gloomy paths of the dissatisfied mind," and he has no patience with time-honored pseudo-philosophic distinctions between body and soul. Such speculations "have something ludicrous for those accustomed to sane and practical thinking." But he does invoke the power of the intellect against the weakness of the body. In a striking passage, whose practical bearing every enlightened neurologist has long since translated into practice—even if amateur "healers" are unconscious of its very existence—Feuchtersleben enforces the lesson that many of our ailments are of our own making and imagining:

Man's happiness and his misery are forever determined by the impressions and images predominating in his soul. Why, then, should it be impossible to control their awakening as well as their disappearance? Why can we not train our eyes to brightness as we so often, alas! painfully train them to dwell in darkness? The raging of the storm upon the heath which penetrates the companions of Lear to the skin, leaves untouched the unhappy king in whom the storm of indignation that tears his breast drowns the fury of the elements without. Incredible as it seems, the most convincing proof of the power of the mind lies in its very weakness. Who does not know that those unfortunate beings whose souls are roaming in the night of insanity remain, in their gloomy prison, free from many of the bodily ailments which attack the normal persons around them? The soul held captive by delusion renders the body insensible to external influences by turning the attention away from the body. Ought not then the trained will, directed toward the serious aims of the intellect, to be as potent as raging indignation or the horrible power of insanity?

Those well-meaning clergymen who so light-heartedly enter upon the task of treating cases which baffle the skill of the trained physician, may well gather a hint of the difficulty of the task from Feuchtersleben's pages. Apropos of those "oversensitive natures whose sad heritage renders them unable to cope with the hard realities of life," he says:

Has not every practising physician found in his own case that at certain critical moments only the most self-sacrificing devotion to his duty could dispel the clouds that threatened his own moral and physical stamina? Such devotion to duty is in itself a preventive of the dangers otherwise inseparable from the activity of a physician as, indeed, we often find that whatever harm we may sustain in the discharge of our duty carries its own healing balm with it.

And the wise physician did not need the prompting of the modern clerical "healer" in order to apply the lesson of Feuchtersleben's treatise (previously urged in Lavater's "Physiognomic Fragments") that "it is beautiful and fitting to be healthy," and that "there exists a visible harmony between moral and physical beauty as between moral and physical ugliness." Nor has the true physician, as Feuchtersleben says, ever been unwilling to "take a hint from the moralist and the priest," provided what is offered is based on knowledge and truth. "He sees the road to salvation as clearly as they."

New York, November 8.

"AWAITS THE INEVITABLE HOUR."

To the Editor of The Nation:

Sir: Mr. Rolfe is certainly right in reading "awaits" (see the *Nation* for October 22). A glance at the new concordance to Gray will show that this is the reading of all the authoritative early editions. As I write, there lies before me a facsimile of the Pembroke manuscript, in which the *s* is plainly visible. Moreover, this sense, "be in store for," "be reserved for" (as it were, "lie in wait for"), is the only one that Gray employs; he uses the word five times in his poetry, and every time with this meaning. Nor is Gray alone among English poets in assigning this meaning to the word: other examples are Shakespeare, "2 Henry VI," i, 4, 35, 67; Milton, "Para-

dise Lost," ii, 193, 710; Sonnets, xv, 9 ("On the Lord General Fairfax").

A man so conversant with Latin literature as Gray would certainly he familiar with more than one instance of the verh "mancre" in this sense, to say nothing of "exspectare" (for example, Horace, Sat., ii, 1, 58). Passing over places like Virgil, Æn. xi, 166; Ovid, Met., iv, 695; viii, 60; ix, 726; xl, 540, we may quote Pseudo-Ovid, Cons. ad Liviam, 357, "Fata manent omnes," and Propertius, iii, 26, 57-8, a couplet which Gray may have had in mind ("all that beauty, all that wealth e'er gave"):

Nec forma æternum aut cuiquam est fortuna perennis:
Longius aut propius, mors sua quemque manet.

ALBERT S. COOK.

Yale University, November 6.

STUDY OF THE BIBLE IN THE WEST.

To the Editor of The Nation:

SIR: Will you kindly give a little of your valuable space in order that your Western readers may be justly represented, and that the impression made by the communication of Mr. Herbert A. Jump, in your issue of October 22, may be corrected at least with regard to the people of the West?

It is to he regretted very genuinely that the deplorable condition of which he writes exists in the East, but I assure you it is not true of the West, for the number of Bible students and readers is increasing every year. It is an interesting, as well as an authentic, fact, that the American Bible Society alone issued from its presses nearly two million copies of the Bible this last year. Voltaire prophesied—just what Mr. Jump seems to fear—that the contents of the Bible would he forgotten in less than a hundred years. But there is no danger. The West is stretching out her arms through her thoughtful sons and daughters, who will carry the hlessed Word into the poor unhihled East. When Mr. Jump learns that in 1777, the date of Voltaire's rash prophecy, the Bihle was printed in only thirty-eight languages, and that now it is printed, sold, and read in five hundred tongues, his fears will he lessened. Right here in this one town, Chicago, the American Bihle Society's retail sales for this last year have increased 125 per cent. over that of any preceding year, and these sales have heen made in the cheaper editions, not in gift copies, nor yet those sent to the heathen—the Eastern house attends to them. The records of A. C. McClurg & Co., agents for the Oxford Bible Society, show an increase of ten thousand volumes over five years ago in the retail sales, and a correspondingly large increase in the wholesale. The Book and Art Exchange has had to have the Winstone Bihle house make a special edition of the Bible, and Thomas Nelson & Co.'s Bible presses cannot turn off Bihles fast enough to supply our Western demand. What are these people doing with the Bihles they are purchasing, if they are not reading them?

A member of the Young Men's Christian Association, and an old Harvard man, is puzzled over the case cited by Mr. Jump ahout memhers of a Bible class not heing ahle to see the "catch" when asked to find a book not in the Bible, because the association has a large following at Harvard of earnest Christian men, and there is also a very large class that is studying the Bible from a scientific point of view. Not to be ahle to turn readily to any chapter is no criterion of one's knowledge, because many who could not name, offhand, just the place where a hook could be found are living examples of what the precepts of the Bihlo teach. If perchance they find even thirteen who do not know the names of the books, especially those not in the Bible, they still rest in the sweet assurance that none of its promises ever have failed, and they know that "every one shall know Me [God] from the least to the greatest."

AGNESS GREENE-FOSTER.

Chicago, November 4.

HOW AN ENCYCLOPÆDIA MAY BE EDITED.

To the Editor of The Nation:

SIR: I have during the past few months received several inquiries about my relation to a work called the "Twentieth Century Encyclopædia," the agents of which have been using my name as an editor. Will you allow me the use of your columns to say that this proceeding is entirely unauthorized? I never saw the work until yesterday, when I looked it up in the Library of Congress. It is quite possible that it contains one or two articles which I wrote some ten or twenty years ago for a cyclopædia that has since become extinct. If so, this is the only ground for using my name. In no proper sense of the term have I heen either an editor or a special contrihutor to the work in question, nor am I in any way responsihle for it. The question what adjective may appropriately designate such a proceeding on the part of book-agents, I leave to others.

SIMON NEWCOMB.

Washington, D. C., November 7.

Notes.

The Champlain Society of Toronto has decided to puhlish, with H. P. Biggar as editor, the complete works of Champlain, hoth the French text and a translation. The whole work will run to four volumes. Mr. Biggar is the author of "The Early Trading Companies of New France" and other historical works. The publications of the society are in limited editions of 500 copies —250 for memhers and 250 for subscribing libraries.

Thomas Willing Balch will soon puhlish through Allen, Lane & Scott, Philadelphia, "L'Évolution de l'arhitrage internationale," which appeared this last summer in the *Revue de droit international et de législation comparée.*

The nineteenth edition of Dr. S. Weir Mitchell's "Hugh Wynne" has just heen issued hy the Century Company, with a special preface. Dr. Mitchell tells his readers that he has rectified "some mistakes in names, dates, and localities." He adds:

These errors were of such a character as to pass unnoticed hy the ordinary reader and disturb no one except the local archæologist or those who propose to the novelist that he shall combine the accuracy of the historical scholar with the creative imagination of the writer of what, after all, is fiction.

Dr. Mitchell further explains that his hook is not "a deliberately planned attack on the views entertained hy Friends." As well, he adds, "might Bishop Proudie be considered as representative of the memhers and views of the Church of England." The author's purpose was "to delineate a great spiritual conflict in a very interesting body of men who, professing neutrality, were, if we may trust Washington, anything hut neutral." In closing his preface Dr. Mitchell discusses the accuracy of historic fiction. The passage is worth quoting in full as the *credo* of a successful writer in this field:

How little the grossest errors in hiography and history affect the opinions of the public concerning a novel long popular may he illustrated hy the fact that one of my critics referred me to "Henry Esmond" for an example of desirahle accuracy. It was an unfortunate choice, for in "Esmond" there is hardly a correct historical statement. The Duke of Hamilton described as ahout to marry Beatrix was the hushand of a second living wife and the father of seven children—an example of contemplated literary higamy which does not distress the happily ignorant, nor are they at all trouhled hy the many other and even more singular errors in statement, some of them plainly the result of carelessness. A novel, it seems, may sin sadly as concerns historic facts and yet survive. The purpose of the novel is, after all, to be acceptahly interesting. If it he historical, the historic people should not he the constantly present heroes of the hook. The novelist's proper use of them is to influence the fates of lesser people and to give the reader such sense of their reality as in the delineation of characters is rarely possible for the historian.

The new volume of Samuel Butler's works in the Camhridge English classics (Putnam) contains the "Characters and Passages from Note-Books," edited hy A. R. Waller. The "Characters" were already known in part from Thyer's print of 1795, but to those of the earlier edition ahout half as many again have now heen added from the manuscript in the British Museum, together with a series of aphorisms and miscellaneous ohservations grouped under various heads. The new "Characters" are like the old, witty but tiresome, lacking somehow the hreath of life. The chief interest is in illustrating the contemporary use of a numher of cant terms, such as "shark," "catchpole," etc. The observations are more readable, chiefly on account of their greater brevity, and more caustic wit. Occasionally, the satire is curiously modern, like this from the chapter "Learning and Knowledge":

The way to be esteemed Learned, is hut only to have a Library, and to he able to Turn to the Indices, upon any Occasion of showing great Reading.

It is hut a step from this to the days of the card-catalogue. But, as a whole, the paragraphs are too casual to possess much weight. Take, for example, his comment on human nature:

All the Business of this World is but *Diversion,* and all the *Happiness* in it, that Mankind is capahle of—anything that will keep it from reflecting upon the Misery, Vanity, and Nonsence of it: And whoever can hy any Trick keep himself from Thinking of it, is as wise and Happy as the hest Man in it.

One needs only compare this with Pascal's Pensée on *divertissement* to feel the difference hetween literature and ephemeral

memoranda. It is well, nevertheless, to have the complete works of the author of "Hudibras," and the publication in a third volume of his minor poems with a certain amount of new verse may afford the opportunity of commenting on him at greater length.

E. V. Lucas has the knack of making anthologies that tempt the reader from page to page, and his latest, "The Ladies' Pageant" (The Macmillan Co.) does not detract from his reputation. Under a series of heads, such as The Buds, Virginal, The Poets and the Ideal, to name the three first, he groups selections from poets and prose writers in praise of women, real or imaginary. To some tastes the book might appeal more strongly if the misogynists were heard more frequently in its pages. Other readers will regret the omission of various names here and there. Thus, one may remark the absence of Hannah More's famous lines under the topic of "The Blues," or of any reference to Mrs. Vesey or Mrs. Carter from the letters of the day. Possibly these ladies may figure somewhere else in the book, but we have not met them as we have dipped in here and there, and there is no index (a sad fault) to appeal to. Again, under Thalia and Melpomene, with Peg Woffington, Mrs. Bracegirdle, and their like, there ought to be some word about Mrs. Oldfield from Savage or some other of her admirers. But these are the little prejudices of the reviewer. He ought to be quite satisfied with the abundance of figures that trip or move with stately grace through this pageant.

There is still doubt as to the origin of the word "Limerick" as applied to a form of verse. In a collection of 114 such stanzas, "The Smile on the Face of the Tiger" (Boston: Bacon & Brown), the anonymous editor, who is said on good authority to be Charles Knowles Bolton, librarian of the Boston Athenæum, is inclined to trace the name back to a custom which obtained a good many years ago to engage in convivial verse-contests at drinking-parties. The refrain sung in chorus ran:

> Will you come up, come up?
> Will you come up to Limerick?

The editor found difficulty in tracing the authorship of his selections, but he tickets nearly twoscore of them. Miss Wells is represented by five. Two in French are by Du Maurier.

The style of Henry Mills Alden's "Magazine Writing and the New Literature" (Harper & Bros.) strikingly illustrates his contention that there is a great gulf fixed between writers of Thackeray's time and writers of to-day. The work exhibits an apparent difficulty in thought, and a real difficulty in expression which Thackeray himself never attained, and which entitle it to a secure place in the new literature. Considering the essential difficulty of the new psychical style, it is perhaps to be regretted that Mr. Alden has increased it by taking a trinitarian view of the first person plural: we the author of this book, we the *Harper's Magazine*, and we the intelligent public are diverse yet one and indistinguishable—from time to time, of course, the mere general reader must recognize with a shock that he is not one of "us." Minor differences of opinion, however, and the intellectual effort required in following the argument should prejudice no one against the important and startling major conclusions. To put the whole matter in a nutshell, the millennium has come; in fact it came almost exactly two generations ago. Mr. Alden holds that the mere physical triumphs of the present are so magnificent as to make all antiquity ashamed of itself: "Since the sixth decade of the nineteenth century more has been achieved in the material progress of the English race than in its whole previous history." But it is our psychical advance that has been most astounding. At about the year 1860 the human spirit entered upon its ultimate state and set about producing a new and ultimate type of art, literature, and civilization; at the same date, all the works of men's hands and hearts that had previously appeared in the world became obsolete:

> Even when, by way of holiday amusement, we don an older and more picturesque vesture and play antiques, we clearly understand ourselves and the *whimsical nature of our relaxation.* (The italics are not Mr. Alden's.)

The trouble with fellows like Plautus, Chaucer, and Montaigne—these are not Mr. Alden's examples; but, since their work fell long previous to 1860, they should illustrate the point—was that they lacked the "sensibility to reality" which is the distinguishing mark of the new literature exemplified by Mary E. Wilkins-Freeman, Mrs. Deland, and Sarah Orne Jewett. The point is, argues Mr. Alden, that *we* are "seeking to know what our world really means for us in all its possibilities, and what are the real values of human existence." Since 1860 we have understood "real" values; previous to 1860 the values were fictitious. Looking from the serene elevation of Henry James or W. D. Howells, the reader will easily perceive that "life was belittled and dwarfed by alien grandeurs" in all the greatest art and poetry, including Michelangelo and Milton—these are Mr. Alden's examples. Truly, as poor old obsolete Pope said:

> Heav'n from all creatures hides the book of fate,
> All but the page prescrib'd, their present state.

But have we really all entered into Mr. Alden's millennium, or are there still a few left who would pit Michelangelo and Milton against James and Howells on the "real values of human existence?"

Readers of "Letters of a Diplomat's Wife" and "Italian Letters of a Diplomat's Wife" know precisely what to expect from Madame Waddington's new volume, "Château and Country Life in France" (Charles Scribner's Sons). Thoroughly familiar with the scenes she describes, yet with a certain freshness of view, due to her American origin, Madame Waddington paints a picture of rural life in France with a charming directness and simplicity. There is the intimacy, though not the piquancy, of the old French memoir in the rambling, unconventional style with which, like a graceful hostess, she introduces us to her home and the circle of her friends. One has the feeling of actually accompanying her on her country visits, of participating in the ceremonies and festivals of the region. The distinguished personages found in former volumes are, for the most part, absent; but there is an interesting chapter on the home of Lafayette; and reminiscences of the Boulanger episode, the Commune, and the Franco-Prussian war are mingled with accounts of hunting parties, weddings, the army manœuvres, and country elections—in short, all those peaceful and homely incidents of French provincial life which the glare of Paris leaves in obscurity, but which furnish the data necessary to any really just comprehension of French character. The final chapters relate to summers passed in remote corners of Normandy and at Boulogne-sur-Mer, affording glimpses of château life, to which the ordinary sojourner in France is a stranger. Those who have not read Madame Waddington's earlier books will be inclined to turn to them after reading this one. Those who are familiar with them need no other introduction to the present volume.

Joseph H. Underwood's "The Distribution of Ownership" (Columbia University Press) is intended to be an historical and critical account of the limitations which have always been imposed, in the common interest, upon the right of private property. It begins with some definitions, taken chiefly from German sources, such as "Property is the environmental complement of the personal spiritual heritage of the age"; and then proceeds to show that in all ages private property has been "subject to social subtractions" which have varied greatly from time to time. The author tells us that "primitive man probably appropriated only what he ate"; and goes on to show that his descendants appropriated more than they could eat, whence arose the necessity of social limitations upon private ownership. For such a study a very thorough training both in economics and in historical jurisprudence is needed, a training far exceeding that possessed by the average candidate for the doctor's degree. Our author has brought to his task no little good will, and the evident conviction that further limitations upon property rights are urgently needed; other qualifications for the work are not apparent. He makes indiscriminate use of a variety of works, good, bad, and indifferent, upon economics, jurisprudence, and sociology, but nowhere shows a firm grasp of his subject. Not infrequently he fails to grasp the meaning of his authors, and in some cases gets things squarely turned around. Thus he refers to a worthless work upon the industrial history of this country as authority for the statement that the British government restricted American industrial enterprise by imposing an export duty on broadcloth in 1631; whereas the author referred to states that this duty on British exports stimulated American industry, and, in point of fact, the law in question probably had little influence one way or the other. Again, discussing changes in fiscal legislation in Great Britain, he says: "The tariff was removed in 1842, and the corn laws were abandoned in 1846." Large questions of social policy he disposes of with brief comment that is alternately flippant or inane; and anything like ripeness and maturity of judgment is conspicuously absent from the entire performance. The sort of "investigation" that is accepted as suitable qualification for the doctor's degree has fallen under more or less suspicion in these latter days, and it is certain that monographs like the one in hand go far toward justifying that suspicion. We greatly need a comprehen-

sive treatise upon the institution of private property in its various economic aspects, but such a work cannot be produced by an immature student in partial fulfilment of the requirements for the degree of doctor of philosophy.

A tiny volume published by E. P. Dutton & Co. gives us "A Dictionary of English Literature," compiled by M. McCroben. It might be called a Dictionary of Authors, as it consists of brief biographies of writers arranged alphabetically. It is not easy to guess just who would care to carry such a book of reference in his waistcoat pocket, but no doubt such men exist.

The Manchester University Press has just published the "Introduction to Early Welsh," on which Professor Strachan was engaged at the time of his death. It has been prepared for the press by Prof. Kuno Meyer.

A. C. Madan has added two volumes to the language books published at the Clarendon Press, viz., a handbook to "The Lenje Dialect" spoken in Northwest Rhodesia, and to "The Wisa-Lala Dialect" spoken in Northern Rhodesia.

Those who are interested in the work of the modern Russian realists may care to know that Leonidas Andreiyeff's "Silence" has been translated by John Cournos and published in a slender volume by Brown Bros. of Philadelphia. The translator's characterization of the story is also characteristic of those who revel in this kind of literature: "A melancholy poem, in which the reader is subjected to a series of heart pangs, and is forced to listen to a music, in which the dominant motif is a terrible, oppressive, and crushing silence."

Nineteen essays and addresses by Prof. Hugo Münsterberg, some delivered at various gatherings of Germans in America or at leading American universities, and some published in Germany or sent as letters to German professors, make up a volume, "Aus Deutsch-Amerika" (Berlin: E. S. Mittler & Sohn; New York: G. E. Stechert & Co.), quite as interesting in its way as any of the semi-popular works that have hitherto come from Professor Münsterberg. Discussing the "Professorenaustausch," or exchange of professors that has been going on between Harvard, Columbia, the University of Chicago, and various German and French universities for some years past, the author explains the large attendance at lectures by American professors abroad as compared with the small attendance at the lectures given by foreigners here, as being due to the different system of registration in courses, the greater freedom of the students in Germany and the Continent in general to select and go where they choose, and to the attraction of an opportunity to hear a foreign language spoken by natives of accomplishment. He thinks Columbia made a mistake, as compared with Harvard, in favoring the use of German by American-born professors lecturing in Berlin. Again, Professor Münsterberg believes that Germany and Emperor William, more than other influences, have kept the peace of Europe, and perhaps the rest of the world. Taking up the question of temperance, and the agitation of Germans in America for more freedom in the sale of beer, Professor Münsterberg states his conviction without mincing that beer has done Germans, both at home and in America, incalculable harm; that it is still doing the students of Germany great injury; and that it is discreditable, as well as short-sighted, for German-Americans to lose their heads in the anti-beer agitation and complain that their personal liberty is being infringed upon.

Georg Winter, who has for many years been a student of the period of Frederick the Great, and who has produced, among other things, an excellent biography of Ziethen, has published in two volumes of nearly one thousand pages a new biography entitled "Friedrich der Grosse" (Berlin: E. Hofman & Co.). This work differs from others in that the author does not lay the chief stress on Frederick's military achievements, but on his management of internal affairs.

The "Enzyklopädisches Handbuch der Erziehungskunde," published by Joseph Loos, with the coöperation of more than one hundred specialists, has been completed by the appearance of the second volume from M to Z (Vienna: Picher's Wittwe & Sohn). It contains 1,101 pages, with no fewer than 256 illustrations and six separate supplements. The contents cover the whole educational field, and not a few of the articles are really monographs on the subjects considered.

"Das schweizerische Zivilgesetzbuch vom 10 Dezember 1907" (Bern: Francke) brings in a volume of 618 pages, in the three official languages of the country, the entire revised body of laws for Switzerland, arranged under four heads: "Personenrecht," "Familienrecht," "Erbrecht," and "Sachenrecht." The book is edited by Dr. E. Leupold.

Prof. Eduard Koenig of Bonn has just published a new "Hebräische Grammatik mit Uebungstücken und Wörtenverzeichnissen" (Leipzig: Hinrichs), which is the outgrowth of long experience in teaching the language.

Prof. Bernhard Weiss of Berlin, in his new work "Die Quellen der synoptischen Ueberlieferung," issued as a part of the series, Texte und Untersuchungen zur Geschichte der altchristlichen Literatur, edited by A. Harnack and C. Schmidt (Leipzig: Hinrichs), gives the result of long study of the origin and composition of the Synoptic gospels. In most respects he follows the lines of his recent book "Die Quellen des Lukasevangeliums." In general he concludes that the material of our gospels is taken from a Matthew source (Q) and an extra tradition (L). On this basis he offers a construction of the text together with explanatory notes.

The seventieth birthday of Prof. Theodor Zahn of Erlangen, a leader of the conservative theologians of Germany, is marked by the publication of a collection of special studies by his pupils in four different countries: "Theologische Studien: Theodor Zahn dargebracht" (Leipzig: A. Deichert). The contents are as follows: Prof. N. Bonwetsch, Göttingen, "Der Schriftbeweis"; Dr. W. Caspari, Erlangen, "Die Bundeslade"; Prof. R. Grützmacher, Rostock, "Die Haltbarkeit des Kanonbegriffs"; Prof. Albert Hauck, Leipzig, "Die angeblichen Mainzer Statuten von 1261"; Prof. L. Ihmels, Leipzig, "Dogmatik und Schriftwissenschaft"; Prof. E. Nestle, Maulbron, "Kapernaum und Kaiphas"; Dr. H. Ohl, Ratzeberg, "Evangelische Lehre von der Busse"; Dr. W. Sanday, Oxford, "The Apostolic Decree, Acts, xv, 20-29"; Prof. E. Sellin, Vienna, "Die Schiloh Weissagung"; Prof. K. Jordan, Erlangen, "Alter und Herkunft der lateinischen Uebersetzung des Hauptwerkes des Irenæus"; Prof. A. Klostermann, Kiel, "Schulwesen im alten Israel"; Prof. R. Seeberg, Berlin, "Zur Trinitätslehre"; Dr. G. Wohlenberg, Altona, "Ein alter lateinischer Kommentar über die 4 Evangelien," Prof. A. Hjelt, Helsingfors, "Mikael Agricola"; Prof. K. Müller, Erlangen, "Zum neutestamentlichen Sühneglauben"; Prof. E. Riggenbach, Basel, "Begriff der διαθήκη im Hebräerbrief." Each of the discussions may be bought separately.

To the series Religionsgeschichtliche Volksbücher (Tübingen: J. C. B. Mohr) a new volume has been added, "Die Ausgrabungen in Palästina und das Alte Testament," by Prof. Hugo Gessmann of Berlin. The same firm announces a work on Modernism by Pastor J. Kübel of Munich, entitled "Geschichte des katholischen Modernismus."

The character of Karl Thieme's "Jesus und seine Predigt" (Giessen: Töpelmann) is indicated by the subtitle "Ein Volkshochschulkursus." The book consists of six semi-popular lectures, delivered last year at the University of Leipzig. In detail, the author discusses the sources of the life of Jesus, his career, his self-consciousness, his proclamation of the kingdom of God, and his moral preaching. The presentation is based on an excellent knowledge of the modern literature of the subject. The author aims, he says, to make the Christians of to-day more tolerant of each other's views, in regard to the person and the mission of Jesus.

To the definitive edition of the works of Descartes, published under the auspices of the French minister of public instruction by Charles Adam and Paul Tannery, there has been added a supplementary volume of correspondence (693 pages, L. Cerf).

Jules Lair and Baron de Courcel (former ambassador) publish for the Société de l'Histoire de France, under the auspices of the French Academy, "Mémoires du Cardinal de Richelieu," from the original manuscripts (457 pages, H. Laurens).

Pierre Horluc and Georges Marinet, professors at the Lycée of Lyons, publish a work of some value to specialists of the French language—"Bibliographie de la syntaxe du Français (1840-1905)."

Lucien Dorbon, the veteran Paris bookseller, has ready the first of four octavo volumes intended to furnish—by subjects—the bibliographical references of 400,000 volumes. Great historical questions, like the Diamond Necklace, have special bibliographies; and there are such general divisions as archæology, heraldry, travel. The work does not pretend to a complete description of editions, with dates and nomenclature, as in the classical work of Brunot, nearly a century old (1810), or in the immense publication now going on of Lorenz. It is intended rather for the use of literary workers who need complete references, without having at hand great libraries. It is a work undertaken entirely by the private initiative of M. Dorbon; but it should supplement considerably the facilities offered for example by the Bibliothèque Nationale.

Eugène Revillout, curator at the Egyptian Museum of the Louvre, publishes the first volume (E. Leroux) of "L'Ancienne Égypte d'après les papyrus et les monuments." It deals with the romance of chivalry and *chansons de geste* in ancient Egypt; historical romance; apologue; the middle age of Pharaonic Egypt in art and customs; religion and patriotism; and psychology in Egyptian art.

The first volume of "Les Cultes païens dans l'Empire romain," by Jules Toutain, lecturer at the École des Hautes Études, treats of the official Roman and Græco-Roman cults (E. Leroux).

In recondite numismatics, two more fascicles (pages 211-394, with thirty-five plates—Bithynie to Juliopolis), have been added to the first tome of the "Recueil général des monnaies grecques d'Asie Mineure." This extensive publication (Piot Foundation of the Académie des Inscriptions et Belles-Lettres) was begun by the late W. H. Waddington and is being completed by E. Babelon and Théodore Reinach (E. Leroux).

The Musée Guimet of Paris publishes the second part and conclusion of "Le Siam ancien," by Lucian Fournereau—a work of archæology, epigraphy, and historical geography (quarto, with forty-eight plates, E. Leroux).

Dr. Gonzalo Picón-Febres, Venezuelan consul in New York, has published in Caracas (Empresa el Cojo), a stately tome of upwards of four hundred pages treating of the literature of his native land during the last century: "La Literatura venezolana en el Siglo diez y nueve; Ensayo de Historia critica." It is illustrated with ninety-two portraits of historians, poets, novelists, and orators. Ample excerpts are given, especially in the department of verse. The Venezuelan, according to Dr. Picón-Febres, is naturally wide awake, vividly imaginative, full of talent, and very fond of poetry, for which he has a remarkable faculty. During the last ten years of the last century there was great literary activity. One would be surprised to read the long lists of names distinguished by Dr. Picón-Febres. He has the southern talent for eulogy, but he has evidently endeavored to be fair-minded. It is needless to say that his chapters contain a vast amount of fresh and interesting information about a country which, through the activities of its President, to whom (as "restaurador de Venezuela") the book is dedicated, is coming more and more into the public eye.

The twenty-fourth annual meeting of the American Historical Association will be held in Washington and Richmond December 28-31. At the opening session in Washington, a joint meeting with the American Political Science Association, Ambassador Bryce will deliver an address, "The Relations of Political Science to History and to Practice." Among the other papers and addresses are the following: "The Use of Census Materials in American Economic and Social History," Joseph A. Hill, chief of the Division of Revision and Results, United States Census Office; "The American Newspapers of the Eighteenth Century as Sources of History," William Nelson, corresponding secretary of the New Jersey Historical Association; "The Use of Newspapers for the History of the Period from 1850 to 1877," James Ford Rhodes; "The Use for Historical Purposes of the Newspapers of the Last Thirty Years," Talcott Williams of the Philadelphia *Press;* "Associated Press Dispatches as Material for History," Melville E. Stone, general manager of the Associated Press; "History and the Philosophy of History," George B. Adams, Yale, president of the American Historical Association; "Normandy Under William the Conquerer," Charles H. Haskins, Harvard; "The Movement of European Expansion Led by Prince Henry of Portugal (1420-1460), the Immediate Predecessor and Teacher of Columbus," C. Raymond Beazley, fellow of Merton College, Oxford; "Religious Toleration in Brandenburg-Prussia under the Great Elector and Its Material Rewards," Oliver H. Richardson, Yale; "Chatham, 1708-1908," Charles W. Colby, McGill; "Grant's Conduct of the Wilderness Campaign," Gen. Edward P. Alexander, C. S. A.; "Lee's Conduct of the Wilderness Campaign," Col. William R. Livermore, U. S. A., and "The Wilderness Campaign from Our Present Point of View," Major Eben Swift, General Staff, U. S. A. Conferences are announced as follows:

"On the Relations of Geography to History: The influence of the Geography of the South Atlantic States on Their History"—Chairman, Edwin E. Sparks, president of Pennsylvania State College; Frederick J. Turner, University of Wisconsin; Ulrich B. Phillips, Tulane University.

"On History in Secondary Schools, with Especial Reference to the Report of the Committee of Seven"—Chairman, Andrew C. McLaughlin, University of Chicago; Lee Bidgood, State Female Normal College, Farmville, Va.; J. G. Croswell, Brearley School, New York; J. Herbert Lowe, Manual Training High School, Brooklyn; William MacDonald, Brown University; Robert A. Maurer, Washington City High Schools; Edmund S. Noyes, Central High School, Washington; Miss Lucy M. Salmon, Vassar College; H. Morse Stephens, University of California.

"On the Problems of State and Local Historical Societies"—Chairman, Evarts B. Greene, University of Illinois; secretary, St. George L. Sioussat, University of the South: (a) Report of Committee on co-operation among historical societies, Dunbar Rowland, Director of the Department of Archives and History, Mississippi; (b) The Applications of Photography to Archive and Historical Work, Waldo G. Leland, Carnegie Institution of Washington; (c) Historical Exhibitions, Albert C. Myers, Historical Society of Pennsylvania.

"On Research in English History"—Chairman, Edward P. Cheyney, University of Pennsylvania; Ralph C. H. Catterall, Cornell; Arthur L. Cross, University of Michigan; Miss Frances G. Davenport, Carnegie Institution of Washington; Charles Gross, Harvard; Laurence M. Larson, University of Illinois; Roger B. Merriman, Harvard; Norman M. Trenholme, University of Missouri.

"On Research in American Colonial and Revolutionary History"—Chairman, Herbert L. Osgood, Columbia; Charles M. Andrews, Johns Hopkins; George L. Beer, Columbia; Evarts B. Greene, University of Illinois; Charles H. Hull, Cornell; William B. Munroe, Harvard; Claude H. Van Tyne, University of Michigan.

"On Research in Southern History"—Chairman, Lyon G. Tyler, president of the College of William and Mary; Douglas S. Freeman, Southern Historical Manuscripts Commission; Charles H. Ambler, Randolph-Macon College; Miss Julia A. Flisch, Atlanta; Alfred H. Stone, Carnegie Institution of Washington; Thomas M. Owen, department of archives and history, Alabama.

The University of Christiania will celebrate its first centennial early in the year 1911.

Worthington C. Ford soon leaves his position as Chief of the Division of Manuscripts in the Library of Congress to act as editor of the Massachusetts Historical Society in Boston. He will be succeeded in the Library by Gaillard Hunt, Chief of the Bureau of Citizenship of the State Department.

Dr. David Decamp Thompson, editor of the *Northwestern Christian Advocate,* died in St. Louis November 10 at the age of fifty-six. He was born in Cincinnati, and was graduated from Ohio Wesleyan University. He was author of two books: "Abraham Lincoln, the First American" (1896), and "John Wesley as Social Reformer" (1898).

The death of Edward Caird, former master of Balliol, just reported by mail from England, removes a rare teacher and a philosopher second only to Thomas Hill Green among the critical idealists of England. Only eighteen months ago, Dr. Caird laid down his work at Oxford to seek sorely needed rest. He was born at Greenock in 1835 and educated at Glasgow University and Balliol. He began his career as tutor at Merton College in 1864. Two years later he accepted the chair of moral philosophy at Glasgow. Those were the days when the empirical movement, accelerated by Darwinism, was bringing into disrepute both the problems and the solutions of traditional philosophy. Steeped in German idealism, Caird directed against the ranks of Comte and Spencer the subtle, critical weapons of Kant and Hegel. He was, however, much less of a controversialist than Green, and also inferior to the latter in constructive thinking and breadth of interest. But he was able, better than any other, to acquaint his countrymen with the sources of his inspiration. His "Philosophy of Kant" (1877) and his "Critical Philosophy of Immanuel Kant" (2 vols., 1889) remain to this day the fullest exposition of Koenigsberg speculation in the English language. Together with his "Hegel" (1888) they did much to fortify Scotland against the onslaughts of empiricism. At the same time, these volumes were by no means servile renderings of German texts; the expositor was constantly turning critic. Not until he became the Gifford lecturer, though, did Caird give free rein to his originality in print. Then he sought to defend the rationality of religion and to expound the logic of religious evolution. "The Evolution of Religion" (2 vols., 1893), and "The Evolution of Theology in the Greek Philosophers" (2 vols., 1903), embrace the addresses in which he used an interesting combination of dialetic and historical fact to show that the religious principle is involved in the most rudimentary experience. Largely because of its historical position, Caird's conception of religious growth shaded off from the Hegelian, on which it fed; but the famous three stages remain, and the culmination is reached in Christianity, which, as Caird saw it, preached a spirit imminent in nature and man, but at once transcendent to both, and using nature as a means to bring forth a higher form of spiritual life. From these, his most independent utterances, which never break with any of Hegel's leading ideas, it is easy to give the thinker a humble niche in the philosophers' gallery. As an influence, though, he must rank high. His teaching at

Glasgow, and later at Balliol, to which he came in 1893, as Jowett's successor, was full of nobility and enthusiasm. His other writings are "The Religion and Social Philosophy of Comte" (1885), and "Essays on Literature and Philosophy" (1892). The latter include his too little known studies on Dante, Goethe, Rousseau, Wordsworth, and Carlyle.

The death is announced at the age of sixty of William Andrews, librarian of the Royal Institution at Hull, England. For ten years he had conducted a local publishing business, in which he brought out some of his writings and compilations on the antiquities of Yorkshire and other counties. Among his works are "By-gone England," "Literary Byways," "Old Church Lore," "Historic Yorkshire," "Curious Epitaphs," and "Modern Merry Men."

News comes of the death, November 15, of Mme. Charles Vincens ("Arvède Barine") at the age of sixty-eight. She wrote much for the *Revue des Deux Mondes* and the *Journal des Débats*. Her published works include "Portraits de femmes," "Étude sur les contes de Perrault," "Princesses et grandes dames," "Bernardin de Saint-Pierre" (in the Collection des grands écrivains), "Bourgeois et gens de peu," "Névroses," "Saint François d'Assise," "Jeunesse de la Grande Mademoiselle," "Louis XIV et la Grande Mademoiselle."

Henri Demesse has died in his fifty-fifth year. He was a well-known member of the Société des Gens de Lettres and of the Société des Auteurs Dramatiques. He wrote for the Paris journals on fine-art topics, and published a number of popular novels.

From Nymegen, Gilderland, comes the report of the death of Dr. B. F. Matthes. Educated at Leyden and Heidelberg, he went out to the Dutch East Indies in 1848 in the service of the Dutch Bible Society. He devoted himself to the study of the history of South Celebes, and prepared grammars and dictionaries of the language.

DEFECTS OF MUNICIPAL GOVERNMENT.

Problems of City Government. By L. S. Rowe. Pp. 358. New York: D. Appleton & Co. $1.50 net.

City charters are changing so rapidly in the United States that any new work on municipal government is useful even if it tells no more than what is going on. Professor Rowe's work possesses such usefulness—particularly in his account of the spread of the commission plan and in the comparative view of American and European experience in the management of public utilities. But the greater part of the work is devoted to a consideration of the city as a social phenomenon. The point of view is indicated in the preface, wherein it is declared that "the rapid development of our large cities has a far deeper significance than the administrative problems which they present," and that "profound changes in social structure are directly traceable to the increasing aggregation of population." All this may be entirely true without helping toward the solution of the American problem, which is to ascertain and remedy the causes of our distinct failure in city government. Those "profound changes" are going on all over the world, but in no other civilized country is such a mess made of city government. That is the point on which enlightenment is needed and to which the efforts of students of municipal institutions should be addressed.

Professor Rowe's method is to arrive at conclusions by deduction from the principles of sociology. Thus we have a series of chapters dealing with the origin of the city, its characteristics in ancient, mediæval, and modern times, the ethical consequences of social aggregation, etc. The process of deduction from sociological premises reaches some startling conclusions. For instance, it is said (p. 79) that "our home ideals have retarded rather than promoted civic advance," and that "the women of this country must bear part of the responsibility for the failure of the home to contribute towards the development of civic action":

> With relatively few exceptions the wife has discouraged the participation of the husband in public life, because of the fear that such participation would take the husband away from home, and that it would encroach upon the time that should be given to the support of the family.

Professor Rowe offers a sociological explanation of this disposition on the part of wives: "Their education in the home and in the school has been of a character which has fostered the strongest individualistic tendencies." We believe, however, that we can give a more complete explanation without relying wholly on sociological premises. We grant that many wives prefer the society of their husbands at home and are too individualistic to be willing to sacrifice this palpable good to the often indefinite and doubtful results obtained from participation in politics. But more specifically, wives do not like to have their husbands mix in politics, because men are likely to drink and smoke more than is good for them; because they come home with the barroom reek that every woman hates to smell, and they wake up next morning with an aching head and a nasty temper that makes eleven kinds of trouble in the house. We believe that such things, rather than merely individualistic tendencies of home and school training, cause wives to use their influence to keep their husbands out of politics.

But, it may be asked, why is it, then, that Britons are able to give so much more attention to the maintenance of good government, not merely unopposed by their wives, but often with their active aid? The answer is that they do not give more attention, but, if anything, less. Their system of government is so organized that it runs well without more attention than citizens can easily supply out of their leisure time. Among the things that impress an observer of English municipal affairs is the absence of the continual fuss and worry about the way things are going, that one generally finds in an American community. Voters' leagues, reform associations, people's lobbies, and other extra-constitutional agencies for expressing public opinion are not there in greater measure, but are hardly there at all. Public opinion finds adequate expression in the regular organs of government and rests placidly content with them. But one finds that those organs are so adjusted as to relieve voters from all exertion save that of passing judgment upon results. Elections are confined to representation. There are no administrative posts to be filled, no delegates to be delivered, no party machine to be supported as a means of coordinating powers and functions distributed among independent authorities. An American election often confronts voters with the duty of making choice among more candidates than an English voter would have to pass upon in a long lifetime. The Kansas City *Star* of November 3 remarked editorially:

> At this election there are seven ballots, each about three feet long. On each of these ballots there are about fifty names. The average voter knows scarcely anything concerning more than half a dozen of the candidates.

All the English voter has to consider at any election is which one among a few candidates he prefers as his representative. This is a matter so plain as to be within any one's comprehension; so simple that it may be dealt with by casual conference with one's neighbors, or discussed over the teacups. In England, too, the civic dignity attracts the wives. If Mrs. Grub's husband, by hint of faithful municipal service, rises to be Mayor, and attracts notice by his benefactions, he may be knighted, thus making her Lady Butterfly. Under American conditions, Mrs. Grub's husband would have to handle a lot of pitch and would be fortunate if he escaped defilement. If he gets ahead in politics, it will be more likely to keep her awake of nights for fear the next graft prosecution may catch him in its net than to afford her the social satisfaction of shining by the reflected light of his dignity.

Now, what is the cause of this difference? Is it due to abstruse sociological factors, or is it due to difference in the ways in which public authority is organized? Let us consider a concrete instance. Take, for example, the case of Toronto, a good-sized city not far from the northern boundary of New York State, and in social characteristics much more American than English. There all the powers of the municipal corporation are vested in the

city council. Professor Rowe notes that American experience has accustomed us to regard this "as the worst possible form of governmental organization." It is admitted to work well in Toronto. Why? Well, when one looks beyond the mere form to consider functions and how they are discharged, one finds that there is a separation of powers that confers upon the representation of the community, as a whole, ability to present and bring to determination any issues of public policy, while the representation of locality is unable to obstruct those functions while possessing ample power to examine, discuss, and criticise. However forms may vary, it will be seen, upon examination, that wherever economical and efficient administration is found in any sphere of government, it is based on the correct adjustment of administration and control—the one function comprehending the power of effective action, in the presence of emergency, the other providing for the subordination of action to the general welfare. As embodied in municipal government, this adjustment may be accomplished in various ways, according to historic accidents of development, but one must scrutinize actual procedure to discern the method. In Toronto, the Mayor and four Controllers are elected at large. In addition, three Aldermen are elected from each of the six wards. All together form the Council. The Mayor presides and is ex-officio a member of every committee. The Board of Control, composed of the Mayor and four Controllers, appoints all heads of departments and subordinate officers, prepares the budget, and proposes legislation. The Council is organized into committees arranged so as to correspond with the administrative departments, and the hearings and inquiries of the committees are the ordinary springs of legislation. But the committees make their recommendations to the Board of Control, which reports to the Council concerning them, giving reasons for dissent, if the report is adverse, or introducing a measure of legislation to give effect to the recommendations, if approved. The system reciprocally connects administration and control, making each a check on the other. Legislation called for by the general interest cannot be held up or blackmailed by the representatives of particular interests. Hence, the system is unfavorable to the development of politicians of the spoilsman type. On the other hand, the system tends to develop City Councillors of the type best fitted to sustain the responsibilities it imposes. Hence, it is favorable to the election of men of character who can promote the interests of their constituents by dint of personal ability in a fair field. The result is that City Council service confers civic honor and in practice is the indispensable condition of further preferment. Councilmanic experience is among the legal qualifications required of candidacy for the position of Mayor.

The spread of such devices as the Galveston commission plan, and the creation of boards of estimates controlling budget preparation, are regarded by Professor Rowe as evidence of "a tendency to look to the executive rather than to legislative authority for the solution of difficulties," or, in other words, that the city council is a decaying institution. If one can distinguish between names and things, is it not the fact that what is really going on is the elimination of a defective type of the city council and the substitution of a newer and better type? What, in effect, is the Galveston commission but a small city council of the English type, in which administration and control are associated in one organ of government? Why should not the New York Board of Estimate be regarded as a legislative as well as an executive body? It certainly is a representative body; in practice it wields both executive and legislative functions. The truth is that the present tendency in this country is to secure, under a change of name, a real city council. But while the old city council was defective in its lack of provision for the representation of the community as a whole, it may be questioned whether the new type of city council which is emerging is not deficient in provision for local representation. While particular interests should have no power to obstruct or blackmail the public business, a sound system will provide that all interests shall be consulted in the determination of public policy. This is the principle that ward representation supplies, and it is not safe to eliminate it altogether.

But the solution of such problems is not to be reached by sociological deduction. The only hope of successful approach is by inductive reasoning—that is to say, by practical consideration of actual results, tracing them to their specific causes and applying specific correctives. It is just in this way that real progress is being effected. For this purpose, comparative study of municipal institutions may help by suggesting better methods, just as a man in trying to correct defects experienced in the organization of his business will naturally inquire how other men in his line manage such matters. Otherwise, comparative study, instead of promoting insight, may confuse and bewilder by its scrap-heaps of discursive information. The anecdote is told of some English man of letters, that he advised a novice who consulted him on literary style, to "shun Carlylese as you would shun the very devil." If for "Carlylese" "sociology" be substituted, the advice is now the best possible that can be given to students of municipal institutions.

CURRENT FICTION.

The Lighted Lamp. By C. Hanford Henderson. Boston: Houghton Mifflin Co.

As in the case of its predecessor "John Percyfield," the reader of this book finds Baedeker daintily disguised by an embroidered cover of romance. But, in spite of the charming and complete descriptions of southern Italy, the book will hardly prove as interesting to the traveller as to the student of the psychic. The hero, having vegetated in an office during the natural time of his bodily and mental unfolding, is suddenly thrust out of business and into a fortune. It is not strange that under the stimulus of foreign travel and unusual companionship his mind should suffer from over-feeding. He becomes uncomfortably conscious of his own personality, both material and spiritual, and although this consciousness is common in some degree to most of us, we can but feel that his super-sensibility is detailed at unnecessary length, especially as we lack conviction, if not assurance, not only of his charm but of his reality. In that respect he is not singular; among a company that persistently remain shadowy despite much labored colloquialism, the delicately fanciful figure of Sappho alone assumes convincing substance. In this story, the author has striven to strike a note above the common gamut, but unfortunately the catastrophe substitutes for that sense of the inevitable which is the soul of tragedy, a hasty and irrelevant slash at the Gordian knot that may find justification in the perversities of life, but not in the canons of art.

Interplay. By Beatrice Harraden. New York: Frederick A. Stokes Co.

The new thought exacts of its fiction that ladies with pasts shall not only prevail, but rejoice. Sackcloth and ashes are no longer worn. The weeping willow has given place to the green bay tree; penitence to pride. In "Interplay" Harriet Rivers has run off from an unbearable husband, with a lover, "honorable, chivalrous, great-minded," has lived with him happily till his death, and at the opening of the story has arisen from her woe like a giant refreshed and is hoping to marry a great Arctic explorer. His relatives are narrow and bigoted enough to object to a bride with a history, and their subjugation is the principal triumph in a plot full of triumphs of "the real thing" over outworn falsities. It was achieved for Harriet by her charms, particularly by her musical talent, and in a still further analysis by the Brahms Sonata in F minor. Listening from ambush to Harriet's playing of this composition,

her most hostile female in-law-to-be discovered that "the fetters were loosened, the great distances were unlocked, the fruitless pettinesses destroyed," and thus all ended as matrimonially as a registrar could make it. As for the explorer, he too had memories of his own in the way of history, and so didn't care a bit, being that rare man who now and then "rises up head and shoulders above his fellows, and shows the right way for the new generation to tread."

The volume would serve well as an advanced text-book in the modernizing of humanity. The whole idea is to bring everything down to 1908, socially, scientifically, ethically. Harriet Rivers and her champions accomplish marvels in convincing their world that kind hearts are more than marriage certificates. The youthful Bess strives nobly to emancipate her mother from the deadening clutch of "culture," and apologizes for her, by saying, "It's only that she does not understand—she has been so sheltered, so shut-in—but she'll learn." Everybody emancipates somebody from something, till theory and practice are indeed thoroughly cleansed of tradition. It is to be added that the story reads interestingly, particularly in the first half. The characters, in modelling and in conversation, are often original, sprightly, and unexpected, the situations fresh and seizing. But one would welcome an interval of emancipation from emancipation.

The Corrector of Destinies. By Melville Davisson Post. New York: Edward J. Clode.

Randolph Mason may not be humanly possible—an embodied characteristic is rarely so; but there is a certain stern charm in so austere a conception as the incarnate essence of justice untinctured with sympathy. The character of his interest in the destinies he regulates is aptly sketched by one who remarks concerning him:

> Write to him the sort of note that you would write to a famous archæologist if you wished him to call and examine a rare Egyptian pot; . . . invite him to the examination of a case of rare and interesting injustice.

It is open to question, of course, whether he and his secretary would ever have seen the light had it not been for Sherlock Holmes and Dr. Watson; but that in an imitative age matters little, so the work be well done. Most of the stories hang upon points of law more interesting to the technician than to the outsider; the "Virgin of the Mountain" plumbs deeper waters, calling into play the reader's personal sense of justice apart from law. Whether one agree with Mason's solution of the problem or not, it is an interesting case, and to the perverse especially piquant as an unique chance to find a joint in the hero's armor of infallibility.

The Sovereign Good. By Helen Huntington. New York: G. P. Putnam's Sons.

In these days of complex diversions the *vers de société* has been supplanted by the larger possibilities of the *roman de société.* In "The Sovereign Good," the characters are of impeccable social standing, with the exception of a few of the Poor, thrown in by way of contrast. The story is slight but pleasing, presenting the not unusual theme of an older woman's love for a gifted boy and the ultimate inevitable turning of youth to youth. The personages of the drama are seemingly intended for portraits, but even so fail to convince. One is left with a dominant impression of well-groomed and fashionably clad men and women taking tea in a richly subdued atmosphere, mildly elated by joys and elegantly submissive to sorrows as politely sophisticated as themselves. The lightness of the book's impact upon the reader's mind is the more regrettable in view of the writer's manifestly sincere effort to express the inner eventfulness of commonplace life.

I and My True Love. By H. A. Mitchell Keays. Boston: Small, Maynard & Co.

This is a slight and rather clever novel, dealing with those problems of marriage, disillusionment, divorce, and re-marriage which seem in danger of taking entire possession of our novelists' minds. Christina Sargent, after being brought up for nineteen years by her father, a distinguished playwright, in the dignified seclusion of a New England village, is sent by him, on a sudden impulse, to learn the meaning of life and of her own heart under the charge of the mother who deserted her in the cradle and is now the beautiful and brilliant widow of the cynical man of fashion for whom she left her too simple and confident husband. The effect upon the girl's character of inheritance from her passive, fatalistic, magnanimous father and her wilful, imperious mother offers a rather interesting subject. The pretty child is neatly analyzed as "a distracting combination of innocence and cynicism," who, "if you attack her on one count . . . shifts to the other with disconcerting agility." She might be fascinating if the author had not made the fatal mistake of letting her be vulgar. Oddly enough, Kitty Warder, the woman who has broken her vows because marriage bored and maternity disgusted her, and who has subsequently passed through the searing experience of fifteen years' subservience to the iron will of a heartless voluptuary, retains her dignity, and, comparatively speaking, her refinement, but poor little Tina speaks and flirts like a shop-girl.

The most amusing thing about the book is that the Sodom into the dazzling gayeties and iniquities of which the innocent Christian is thrown is not the usual London or New York, but—Boston! The English of this novel is unusually good, and the illustrations are, if possible, more than usually inappropriate to the text.

Great Ralegh. By Hugh de Sélincourt. New York: G. P. Putnam's Sons. $3.50 net.

A book which is written professedly for the general reader rather than for the special student must be judged as a piece of literature, and as such the present work is typical of the times in its failure to distinguish between vivacity and a cheap smartness and between legitimate illustration and irrelevance. We say typical of the times, for any one who reads largely in the mass of biographies now printed must observe a note of amateurishness that seems to grow more marked year by year. Some of them show on every page that their authors are mere novices at composition; others are by writers who never learn; their work is not literary and has no sign of the professional craftsman. Only here and there a rare example indicates that its author has the sort of training that would have been expected not long ago from the veriest compiler of Grub Street. As for Mr. De Sélincourt, he should know that it is not vivacity to close a paragraph on the apparent growth of humanity since Elizabeth's day with the snapper: "Let us be thankful for that, and let us by all means subscribe to the Home for Lost Cats." Nor does it show skill in composition to lug in an account of the trial and death of Mary Stuart, too brief to be interesting in itself and too long to fall properly into the general narrative. And again, to exaggerate insignificant acts is not the artistic way to magnify one's hero. Mr. De Sélincourt makes a vast parade of the fact that Ralegh, when Lord Warden of the Stannaries, once deigned to ride over the muddy roads of Devonshire to inspect the river at Roxburgh Down. *A la bonne heure!* That doesn't quite prove that "their [the Elizabethans'] capacity for bard work was unequalled."

These faults are typical of the whole growing school of biography to which Mr. De Sélincourt's volume belongs. Let us add that he has read up his subject better than is often the case, and that his subject is of inexhaustible interest. His analysis of the great Queen's power over her courtiers is thoroughly intelligent, though marred once or twice by bad taste in expression. His characterization of the two Cecils is excellent.

Equally excellent is his explanation of the inevitable antipathy between Ralegh, with his exuberant imagination and his reckless expansiveness of the true Elizabethan, and James, with his narrow vision and timid contraction. And then the man Ralegh himself, who could miss the contagion of his magnificent audacity? Mr. De Sélincourt becomes especially entertaining in his account of Ralegh's latter years of imprisonment and adventure in Guiana, despite a trick of apologizing where simple statement of facts would have been more effective. If Ralegh appears in our eyes to have debased himself by his letters of appeal from the Tower, it is because we forget that the men of that day, like the Homeric heroes, were not ashamed of their emotions. And were Ralegh's letters ten times more grovelling, they should be forgiven for that splendid and pathetic epistle to his wife, with its summing up of all the mad hilarity and endless ambition of the Elizabethans:

> For the rest when you have travelled and wearied your thoughts on all sorts of worldly cogitacions, you shall sit downe by Sorrow in the end.

What echoes of Shakespeare and all the choir of the dramatists run through those words! It is a note peculiar to a generation of great physical vitality and experienced in reckless adventure, and its almost complete absence from the literature of to-day is as distinctive a mark of our age as its constant presence is characteristic of the spacious times of Elizabeth. We may remark by the way that Mr. De Sélincourt has scarcely a word for Ralegh the poet, and makes too little use of purely literary materials generally. How valuable a generous use of such illustrations might be can be seen from the passage in which Mr. De Sélincourt takes up from one of Ralegh's letters the phrase, "Princes are lost by securetye," and shows its parallels in Shakespeare and Spenser, although he does not explain that "security" with these writers meant "carelessness." It is like a sudden, deep glance into the mind of the age.

Mandalay and Other Cities of the Past in Burma. By V. C. Scott O'Connor. With illustrations, maps, and plans; pp. xx+436. New York: D. Appleton & Co., $6 net.

The resuscitation of the past of Burma, as that past finds expression in its cities, is the aim of the author of this sumptuous volume. His success is due largely to the fact that he is not a casual traveller, but one who has lived among the scenes which he pictures and has imbibed much of the spirit which has ever characterized the Burman. His book is not easy reading, except to those familiar with the country and its history—a people whose chief concern from time immemorial has been, not the acquisition of wealth, but the storing up of spiritual merit. The kings' palaces, though superb, were of wood, while the temples and pagodas were of brick and stone. The unfinished pagoda of Mingun "is the biggest mass of brickwork in the world," and by its side is the largest bell in the world, whose majestic voice fills the air with a deep tremor. The most wonderful object in all Mandalay is the pagoda, "where the Buddhist scriptures stand carved in stone. Here is the biggest Bible in the world, each page of it a monolith of white marble the height of a man. And each of these pages, 729 in number, has a temple to itself. The white temples stretch away in long avenues like an army of soldiers."

This place, the last of the capitals, having been founded in 1857, has the greatest interest, and considerable space is devoted to a sketch of its history and a description of its present condition. Here, in 1879, King Thibaw sought to make his throne secure by the massacre of his seventy brothers and sisters. The abyss which separates the Eastern from the Western conscience is shown by the fact that at this day, "the general sentiment in Burma is that the massacre of the princes was a political necessity; painful and unfortunate perhaps, but inevitable, and warranted by a hundred precedents." The capital of the Burmese Empire at the zenith of its power, where art achieved its highest triumph, was Pagān. Yet notwithstanding its magnificent architectural remains, which cover an area of 100 square miles, it is rarely visited by travellers, and its romantic history is almost unknown. The story of Pegu, in some respects the most famous of all the capitals, a very populous city in the fifteenth century, with a circumference of twelve miles, is largely told in the quaint language of the earliest European travellers and traders in Burma

The value of the work is greatly enhanced by its wealth of illustrations of the monuments of the land, "alas! now hastening to decay." The delicate beauty of the details of the ornamentation of the palaces and religious buildings is strikingly brought out in the reproductions of photographs. It is to be hoped that such an interest will be awakened in these remains, many of a remote past, that there may be a systematic search among them, which would doubtless bring to light numerous hidden treasures revealing much of the untold story of early Buddhism. Only a short time ago there was discovered in the jungle of Pegu a statue of Buddha 181 feet in length. All the remarkable art, however, is not ancient. There is a figure of Gautama carved in 1864 from a solid block of marble, which it took 10,000 men thirteen days to drag from the edge of the canal to its present site. Lord Curzon gave much attention to the work of the preservation and investigation of these remains. Many buildings that might have utterly perished have, under his influence, been given a new lease of life. The volume closes with a minute of his, issued in 1901, on the necessity of the preservation of the great palace at Mandalay, on account of its value as a model of the civil and ceremonial architecture of the Burman kings.

Science.

Heredity. By J. Arthur Thomson. New York: G. P. Putnam's Sons. $3.50 net.

There have been, of late, many comprehensive examinations of the questions popularly associated with the name of Darwin. This book, an exceptionally handsome volume of the Science Series, is the newest of them. The author, a professor in the University of Aberdeen, confessedly does not undertake to contribute new material of his own, but seeks to collate the important facts and recent theories, and to discuss them, taking his stand frankly, and almost too insistently, on the doctrine that no transmission of an acquired character is known. In addition to a clear statement of current theories, there is much instructive criticism and comment, often requiring very attentive perusal, which the reader will find most stimulating and suggestive. The treatment is everywhere fresh, the language crisp and sometimes breezy. Particularly attractive is the exposition of Mendelism—and the incidental query as to its application to man, about which at present little is known—and to many readers of books along this line, the chapter on "Heredity and Disease" will be novel and entertaining.

It is in the last chapter, "Social Aspects of Biological Results," that the author is perhaps at his best, drawing fine distinctions well worth careful consideration. Here he points out the difficulty of making any extended practical application of our knowledge of heredity and pricks some of the bubbles which recent dreamers have been wont to blow. The formulæ of biology may not be applied to sociology without being rigorously tested, and it is a mistake to regard sociology as merely a higher branch of biology. The sociological group is made up of complicated units working together in a manner at present as much beyond biological analysis as the life problems of the individual unit are beyond mechanical analysis with reference to merely chemical and physical process-

es. The ideals of the biologist and the sociologist are by no means identical:

> Sociologically regarded, illegitimate children do not appear to be very desirable; biologically regarded, they are often valuable assets.

A similar argument is that trawling, despite domestic and pecuniary gains, means the disappearance of the line fisherman, a type the race can ill afford to lose.

Thomson urges that man varies but slowly, so that a rapid social variation must be suspected to be of other than germinal origin, and hence quite incapable of transmission. On the other hand, the plasticity of the human organism permits advantageous modifications, even though these be not inherited, and the practical question is the reimpression of these modifications on successive generations. There is, in human life, also an extremely complex external heritage, (customs, traditions, institutions, and so on) found at most but slightly in animal life. This leads to the interesting suggestion that in the human race "not a few of the biologically and socially unfit are only *modificationally* veneered, or repressed, or arrested," not hereditary forms at all. With the social doctrine of non-interference with natural selection our author has no sympathy. Infant mortality is not altogether a question of a survival of the fittest it is often artificially exaggerated; other fatal weaknesses, too, are frequently modificational and capable of being overcome by intelligent treatment, and in other matters to rely upon the selective power of the bacteria in improving the race seems to him merely to admit that man cannot select better. "That the weakling is to be allowed to breed more weaklings if it can is another matter." We have no space to follow his discussion further. Let it suffice to note as his conclusion that for human societies biological formulæ are not easily applicable, that rational selection profoundly affects natural selection and the process is far subtler than in stock breeding, and that the existence of various human societies causes yet greater complications, even if we can agree what to select for and are consistent in selection.

For those readers who may wish to follow the subject further there is a voluminous bibliography and a useful index of the books and articles, in which the authors are classified under nearly sixty heads.

A book on mental healing, by the author of "Confessio Medici," will, at least, be entertaining. The Macmillan Company announces such a work for early publication under the title of "Faith and Works of Christian Science." Among other things the book will examine critically two hundred cases reported as cured by Christian Scientists. From the same firm we are soon to have the fourth and last volume of the "Cyclopædia of American Agriculture," edited by Prof. L. H. Bailey.

One would think that even in these days of specializing, a few places might be left unaffected by the extreme division of labor, and that the garden might well be one of these. A small handbook can contain the essential facts relating to most of our cultivated plants, and of such handbooks we now have untold scores. But the fashion has set in of breaking the subject into smaller and smaller fragments. The bit before us at this moment is "Daffodils," by A. M. Kirby (Doubleday, Page & Co.). The group of allied plants is not large except in the multiplicity of varieties, but concerning these the author has made a very readable book. The plants which one knows as narcissus, jonquil, daffodil, and campernelle, are among the most satisfactory for home gardens, because as yet their enemies have hardly found them out. They have been cultivated for many centuries, and have grown wild for many more, but up to the present time, they have been attacked by practically only one insect pest and one destructive blight. Moreover, they survive careless treatment and are patient under neglect—qualities well calculated to make them favorites. This little volume gives sound advice as to the varieties and their management, and goes even so far as to bring before the reader the recondite processes by which new varieties may be produced and perpetuated.

Richard C. Maclaurin, head of the department of physics at Columbia University, was chosen, November 11, president of the Massachusetts Institute of Technology. Since the retirement of President Pritchett, three years ago, the place has been held provisionally by Prof. Arthur A. Noyes, who will now be able to return to his important experimental work in the laboratory of physical chemistry. Dr. Maclaurin was born in Edinburgh, Scotland, in 1870, although his early years were passed in New Zealand. He studied at the University of Cambridge, where he received the M.A. degree in 1896, being bracketed in his examinations with the senior wrangler in the first division of the first class in part two of the mathematical tripos. After graduating he spent two years in the United States and Canada studying and visiting various colleges. He then returned to Cambridge to study law, winning the highly prized McMahon law studentship, and in 1898 gaining the Yorke prize for a thesis on "The Title to Realty." In the same year the university conferred on him the degree of Doctor of Science for his work in pure science, and in 1904 honored him with the degree of LL.D. Meanwhile, he had been appointed professor of mathematics in the University of New Zealand, and in 1903 dean of the faculty of law. In 1907 he accepted the chair of mathematical physics at Columbia University, in place of Dr. R. S. Woodward who had been made president of the Carnegie Institution. Dr. Maclaurin's varied training as man of science and lawyer, and his wide experience, ought to fit him peculiarly for his new and responsible post. Some notion of his theory of education may be gained from a paragraph in a paper published by him in a recent number of the *Revue Scientifique:*

> The usual practice is to devote the earliest part of a student's life to so-called culture, and to postpone his scientific and technical training to a later stage. This artificial arrangement is thoroughly irrational; for if any separation be really required, it would seem more reasonable first to train the young mind thoroughly in scientific methods and leave the assimilation of real culture to a later period, when he has a broader outlook and a better knowledge of men and affairs. This is the educational principle underlying the training at the Massachusetts Institute of Technology.

In the death of Dr. William Keith Brooks, November 12, the Johns Hopkins has lost a scholar who has been connected with the institution since its foundation. Dr. Brooks was born in Cleveland March 25, 1848; he graduated from Williams College in 1870, and from Harvard received the degree of Ph.D. in 1875. He was for a while an assistant in the museum of the Boston Society of Natural History, but left that position when the Johns Hopkins was established, in 1876, to act as associate professor of zoölogy, and later as full professor. He was also connected with various learned societies, and at one time was director of the marine station at Wood's Hole, Mass. In 1882 the Maryland Legislature appointed him chairman of the Oyster Commission, and he drew up a detailed report of the condition of the Chesapeake oyster beds. His publications include "Handbook of Invertebrate Zoölogy," "The Stomatopoda of H. M. S. Challenger," "A Monograph of the Genus Salpa," "The Foundations of Zoölogy," and "The Oyster."

Dr. Azel Ames died November 12 at the age of sixty-three. He was a well-known sanitary engineer, and served with distinction in the civil war and the war with Spain. Later he was director of vaccination in Porto Rico, and served on several other commissions. In 1874 he published "Sex in Industry," and in 1902 "Elementary Hygiene for the Tropics." He was also a special student of American Colonial history, as shown by his "Mayflower and Her Log," published in 1901.

Drama.

Richard Mansfield, the Man and the Actor. By Paul Wilstach. New York: Charles Scribner's Sons. $3.50 net.

This is the sort of book that might have been written by a theatrical press agent, so packed is it with trivial and irrelevant detail, so devoid of sober judgment, so disorderly in arrangement, so oblivious of uncomfortable facts. Mr. Wilstach was associated with Mr. Mansfield for many years, was devoted to his person and interests, and writes of him with an unwavering and self-evident partiality which inspires distrust in him, both as chronicler and critic. He tells much that might as well have been left unsaid, and leaves untold much that would have been both interesting and pertinent. It is unnecessary to follow him through the main outlines of the actor's professional ca-

reer, which are already pretty generally known. No one disputes that Mansfield was a man of great and varied artistic ability, of high courage and ambition, of imperious, violent, and whimsical temper. All these qualities he inherited from his mother, the famous Madame Rudersdorff, a most able and distinguished woman. He was, along certain lines of romantic and eccentric drama, an admirable actor. Moreover. he was a liberal, tasteful, and progressive manager, actuated by a profound belief in the dignity of his profession—although he did not always illustrate it—and by definite views touching the artistic and educational functions of the stage, to which he was generally faithful. But he was not by any means, as Mr. Wilstach seems to maintain, the greatest or most versatile actor of his time. nor were all his favorite impersonations upon any thing like the same level of excellence. It is noteworthy that Mr. Wilstach does not quote recognized authorities in support of his most extravagant contentions.

That Mr. Mansfield had a potent and curiously sympathetic personality is proved by the masses of theatregoers of all classes who flocked to see him during the last ten years or so of his career. To that personality he was a slave. He could, occasionally, as in Chevrial, adapt it; he could not disguise it or greatly modify it. And, all unconsciously, Mr. Wilstach reveals the cause of his essential lack of versatility. He quotes him as saying:

> Inspiration only comes to those who permit themselves to be inspired. It is a form of hypnotism. Allow yourself to be convinced by the character you are portraying that you are the character.

This is one of the commonest delusions of second-rate actors. In their own jargon they feel the character, flatter themselves that they are the character, and then proceed to interpret it in accordance with their own natural impulses. Acting is an intellectual, not an emotional, process; and the versatile actor is he who is careful to keep his private personality apart from the fictitious identity. Elsewhere it is noted that, whereas Edwin Booth, and some other actors, could indulge in social pleasures up to the very raising of the curtain, Mansfield had to keep himself in rigid seclusion for hours before acting, lest he should break the spell. This is just what might be expected. Booth, a great actor, had fixed intellectual conceptions which were not affected by external happenings. One of our greatest modern actresses used to tell her weeping stage associates funny stories during her most pathetic death scenes.

It is in chance revelations of this sort that this book partly justifies itself. The letters to Mr. Mansfield's wife and son, in which the actor shows his tender human side, make very pleasant reading, while his generosity, his courage in adversity, his endurance in suffering, and his extraordinary self-reliance compel admiration. They do much to atone for his unruly passions and his colossal egotism.

"Salvation Nell." presumably the first product of Edward Sheldon, a very youthful dramatist, was produced in the Hackett Theatre, in this city, on Tuesday evening by Mrs. Fiske. It is a reduction of the modern craze for realism almost to the point of absurdity. At the bottom of it—barely perceptible in the intervals between living pictures—is the skeleton of a possible drama, but the author had not the skill to articulate the disjointed fragments, or put them to practical use. The professed theme—the redemption of a castaway, by the power of love, backed by religious enthusiasm—would be of an inspiring kind, if treated with sincerity or ability, but in this case is made worthless, if not actually meretricious, by vulgar and irrelevant sensationalism. Of the spiritual conflict, which alone could give dramatic force or value to such a story, only a glimpse is afforded here and there, and then only in very crude and incredible fashion. The representation consists mainly of reproductions of the coarser elements in saloon and tenement life, often indisputably true in the mere externals of ribaldry, drunkenness, degradation, and dirt, but wholly unnecessary to the main plot, and altogether unprofitable and unpleasant. There is no more pestilent heresy in the theatre of to-day than the notion that truthful detail is necessarily and invariably precious on its own account. As a panorama "Salvation Nell" is often extraordinarily vivid; as a play it is, except at two or three isolated moments, invertebrate, disagreeable, and worthless.

Henry Arthur Jones's new comedy, "Dolly Reforming Herself," which has recently been produced at the London Haymarket, contains some scenes in his best comic vein. It begins with a New Year's Day discussion, which results in a general resolution to get rid of certain bad habits. Thus Dolly Telfer is to cure herself of extravagant indulgence in dress and Capt. Wentworth is to stop flirting with his married cousin The scheme of the play is to show that, in spite of good intentions and more or less honest effort, the personages concerned are no nearer to reformation at the last curtain than they were at the first.

Music.

Schuster & Loeffler of Berlin announce the early publication of a new and complete edition of the literary works of Carl Maria von Weber. The volume, edited by Herr Georg Kaiser, will contain no less than forty articles not included in any previous collection.

A brochure is in preparation by Arthur Farwell for the National Federation of Musical Clubs, which is to contain a complete list of the works of American composers, with their publishers. It will probably be ready in May.

Oscar Hammerstein is continuing his good work of making American audiences familiar with the best modern French operas. "Samson et Dalila," which he produced at the Manhattan last Friday, is, to be sure, not so modern as "Pelléas et Mélisande," for it was written as long ago as 1872. Like the "Legend of St. Elizabeth" of Liszt and the Biblical operas of Rubinstein, "Samson et Dalila" can be performed either as an opera or as an oratorio; Saint-Saëns wrote it deliberately from this point of view, because at that time the Parisian managers refused to stage his operas; but it is vastly more effective as an opera. Yet while it is often sung in this country as an oratorio, at the spring festivals, it has had but one performance as an opera, and that one, which occurred at the Metropolitan Opera House in 1895, was hardly adequate and attracted such a small audience that it was not repeated. Since then, audiences have changed in their attitude toward new operas or revivals, and the Manhattan production was witnessed by a crowded house and applauded with great cordiality. There are not a few dull pages in the opera, but these are more than atoned for by the abundant enchanting numbers, among which the great love duo, "Mon cœur s'ouvre à ta voix," is world-famed. Saint-Saëns was the first composer who transplanted Oriental coloring into European scores with scientific intelligence as well as technical skill, and of this talent there is a delightful specimen in the ballet music to which, in the last act, the Philistine maidens dance in the temple of Dagon. In this scene Mr. Hammerstein introduced his latest importation, Odette Valéry, whose specialty is a snake dance. The principal singers were Gerville-Reache, Dalmores, Dufranne, and Vieuille.

Oscar Hammerstein's new Philadelphia opera house opened last Tuesday evening with "Carmen." Maria Labia took the title rôle; Dalmores, Don Jose; De Segurola. the Toreador; Gilibert, El Dancairo; and Vieuille, Zuniga, "Samson et Dalila" will be given in Philadelphia to-night. Philadelphia will hear Mme. Tetrazzini in "The Barber of Seville" at the first matinée, Saturday, November 21.

For five years—ever since their Academy of Music was destroyed by fire—the music-lovers of Brooklyn have been obliged to come to the Borough of Manhattan for grand opera. The opening of the new Academy, last Saturday, inaugurated a new era. "Faust" was sung by the Metropolitan Opera Company, with a cast headed by its two most popular artists, Caruso and Geraldine Farrar, and with the same scenery, chorus, and orchestra as on Broadway. Fourteen of these performances are to be given. Grand opera is, of course, only one of many functions of the new Academy. The auditorium, which seats 2,200, is to be used also for concerts, oratorios, and meetings. The building contains a concert hall seating 1,400, a banquet hall for 600 diners, a lecture hall for 400 listeners, and four smaller lecture halls for 100 each.

The coming to these shores of Dr. Ludwig Wüllner is an event of unusual interest. Americans are still far too much inclined to worship beauty of voice *per se*. Such beauty is, no doubt, a very desirable thing for a singer to possess, but there are other qualities of greater importance. These are embodied preëminently in Dr.

Wüllner's art. He rather welcomes the epithet, "the singer without a voice," which has been applied to him, because it calls attention to the fact that he has won international fame by other means. As a matter of fact, he has a voice of agreeable quality, except when he forces it; but at the same time it is undeniable that if, like so many other singers, he had a *vox et præterea nihil*, he would never have made his mark on the concert stage. He was for a time an actor, of a highly emotional type, one can safely say, and he had the happy thought of applying to the lyric song the qualities which help an actor to success, much as Geraldine Farrar and Maurice Renaud apply them operatically. The lyric song needs such a rescuer badly, for it has fared ill of late in the hands of the mere vocalists, who sing with the throats only and not with the head and heart. Head and heart are in evidence every moment when Wüllner is before an audience; when he sings Schubert's "Wanderer," "Erlking," or the "Doppelgänger" there is not a shade of meaning in the poem that is lost, not a subtle accent in the music that is neglected. One thinks not of voice, nor of vocalization; one simply enjoys what he sings; his audience at Mendelssohn Hall last Saturday applauded him as if he were a Caruso, but for very different reasons. Out of his repertory of 700 songs he chose for this concert ten by Schubert and ten more by Brahms, Schumann, Wolff, and Strauss.

The dates of the concerts which Gustav Mahler will conduct for the New York Symphony Society are Sunday afternoon, November 29; Tuesday evening, December 8, and Sunday afternoon, December 13. The chorus parts of Mahler's Second Symphony will be sung by the chorus of the Oratorio Society, which Frank Damrosch is preparing for that occasion. On account of the many extra instruments required for the Mahler Symphony, the orchestra will be increased to one hundred and fifteen musicians.

The Kneisel Quartet announces two matinées at Mendelssohn Hall on Tuesday, January 19 and February 23. This series has been arranged especially for the convenience of persons living outside of this city and of those who may not wish to subscribe to a longer series of concerts.

Art.

The Cathedrals and Churches of Northern Italy: Their History and Their Architecture; together with Much of Interest concerning the Bishops, Rulers, and Other Personages Identified with Them. By T. Francis Bumpus. Illustrated. Boston: L. C. Page & Co. $2.50.

This volume belongs to the Cathedral Series, of which the Cathedrals of Northern and Southern France, England, the Rhine, and Northern Spain have already appeared. It includes Milan, Verona, Vicenza, Padua, Venice, Ferrara, and Bologna, and the Lombard churches of Modena, Parma, Piacenza, Cremona, and Pavia. A reference list of the more noteworthy pictures and wall-paintings in the churches described in the text is appended.

The introductory chapter treats of the guiding principles of North Italian church art and the distinguishing characteristics of the various schools. The tendency to deny the connection between the early Christian churches and the heathen basilicas, prevalent in the middle of the last century, is now obsolete. The obvious difficulties in the way of adapting the small *cella* of the Roman temple to the uses of Christian worship, and the equally obvious similarity in plan and construction between the early Christian churches and the Roman basilicas, afford ample proof that the appropriation of the latter for the purposes of worship was also followed by the erection of edifices on the basilican model. The author, accordingly, concedes little independent merit to the early Christian builders. But the fact that antique art furnished them both their constructive and decorative elements, and that as the edifices which afforded the material for plunder fell into decay their buildings became ruder and, except in mural paintings, poorer in decorative effect, might well have received greater emphasis. The modifications introduced in the basilican model when the new spirit began to assert itself are traced with clearness and are fully described in the study of the various churches personally visited and examined by the author. It is doubtful, however, whether his hope that thereby the lay reader may be enabled even approximately to fix the date of an edifice, or its place in the development of a style, will be realized. For this a far fuller and different illustration is necessary. The evolution of the Romanesque and Lombard styles is concerned with such a multiplicity and variety of constructive and ornamental elements, these elements are so widely scattered, and the thread of progress is so often obscured by a reversion to early methods, that the reader is soon lost in details—unless, indeed, he be so fortunate as to be able to follow the author's footsteps book in hand.

Most satisfactory is the analysis of Byzantine architecture as it appears in the West at Ravenna, Torcello, and Venice. But it has always seemed to the reviewer that in a work not designed for the technical student, certain fundamental structural principles which roughly distinguish the great styles might be given more prominence. Such, for example, is the Romanesque restoration of the column to its Greek function as a supporting member, the Roman having employed it, like the entablature, purely as a decorative element, except when he servilely copied Greek temple construction; or, again, the Byzantine solution of the problem of placing the dome on the square, as marking the advance from the Pantheon to St. Sophia. Such broad distinctions, while they do not tell the whole story, are exceedingly useful in fixing the vital differences of styles, for while in Greek art these differences are chiefly those of proportion and ornament, in all subsequent architecture they are primarily those of construction.

To the reader interested in architecture, especially if he be able to follow the author's commentaries *in situ*, this volume will prove a valuable aid to intelligent comprehension.

The American Academy in Rome announces a competition for the prize of Rome in architecture. It is open to unmarried male citizens of the United States, who are graduates of one of the following architectural schools: Harvard, Columbia, Massachusetts Institute of Technology, University of Pennsylvania, George Washington University at Washington, Cornell, University of California, Washington University, St. Louis; University of Illinois; or who are graduates of a college of high standing and hold certificates of at least two years' study in one of these schools; or who have received the diploma of the School of Fine Arts in Paris. The beneficiaries receive travelling expenses to Rome, and, on completion of the full term of study, expenses to homes in the United States. Each beneficiary will get $1,000 annually for not less than three years. During their residence in Rome, the beneficiaries are required to live in the academy, where studio facilities and sleeping rooms are provided for them without charge. They are required during the first year to remain in Rome and in central Italy. During the second year they travel in Italy and Sicily, and during the remainder of their term, in Italy, Sicily, and Greece, and in other countries where classic and renaissance remains exist.

Among the exhibitions at the dealers' galleries in this city are paintings by Pierre-August Renoir at Durand-Ruel's, till December 5; and paintings by Howard Pyle at Macbeth's, till November 25.

Achille Jacquet, the distinguished French engraver, has died at the age of sixty-two. He studied under Pils and Henriquel-Dupont, obtaining the Grand Prix de Rome in 1870, and a second medal at the Salon in 1877. In 1892 he succeeded his master, Henriquel-Dupont, at the Académie des Beaux-Arts. His best-known work is after Meissonier, but he also engraved pictures by Bouguereau, Detaille, and other artists.

Finance.

A FINANCIAL ANNIVERSARY.

One year ago last Tuesday, people read in their newspapers that the government had taken the panic in hand and was to apply a sedative. This was the issue of $100,000,000 in 3 per cent. one-year notes, and $50,000,000 in 2 per cent. bonds under the Panama Canal Act. At the moment, as most people will recall, the usual process of

reasoning in the matter was suspended, because the credit crisis was still alarming, the currency famine at its worst, and a score of important industrial centres were resorting to a makeshift "emergency currency" of their own to keep the wheels of trade moving. The natural supposition was that the government's action, being announced as a relief measure, was calculated to remedy, quickly and vigorously, some of the worst symptoms of the malady. Had it not been for this vague idea, most people would have asked at once, What possible sense can there be in the United States Treasury's asking a loan of $150,000,000 from a money market where merchants and manufacturers can with difficulty get the funds to conduct their ordinary business?

It was explained in the Treasury circular of November 16, 1907, that the cash need not really be taken out of the banks at all. The greater part might be instantly redeposited on government account, or, if the banks preferred, they might use the new securities as a basis for increase in their own circulating notes. Here was at least the germ of an idea; a means might be provided for meeting the urgent demand for circulating medium, and for stopping the "currency famine." But the banks soon discovered a flaw in the reckoning. If they employed the bonds as a basis for circulation, then, in buying the bonds, they were simply exchanging reserve money for banknotes which could not be lawfully used as bank reserves. If they pledged the bonds as collateral for government deposits, then they were giving up 100 per cent. in lawful reserve money, and getting back only 75 to 90 per cent. In the case of the 3 per cent. notes, they could not spare the margin of actual cash required to carry out the operation; in either case, they would be forced to tie up their resources in a public loan, at the moment when their customers were in most urgent need of them.

The Treasury had intimated that the 3 per cent. note issue was designed primarily to draw out hoarded currency through the heavy cash subscriptions expected from individual investors; but the idea turned out a complete illusion. The public was in no mood whatever to invest—least of all in a 3 per cent. security, when the markets were full of high-grade issues which, at the panic prices, would yield nearly twice as much. Practically no individual subscriptions were received. The banks, too, were equally reluctant. The $50,000,000 in Panama bonds they took, but without enthusiasm; within a week, sale of the $100,000,000 3 per cent. notes was abruptly suspended. There had been issued only $15,436,500 out of the proposed $100,000,000; that was the end of the experiment.

This extraordinary chapter of history may properly be recalled to-day because its lesson ought to be emphasized, and because the maturity of the 3 per cent. notes, this week, gives opportunity to view the whole scope of the operation. When the fifteen millions and more are redeemed on Friday, the government will also pay out $463,000 in accumulated interest. This sum of nearly half a million dollars is pure waste; its expenditure has accomplished no useful purpose, to the government, to the money market, or to the banks. Even the Panama bond issue has served merely for a belated inflation of our banknote currency, which the banks have for ten months past been laboring to reduce. The temporary influence of the expedient, in the panic period itself, was merely to impede the restoration of the surplus bank reserve, because of the resultant expansion of liabilities.

The lesson of the affair, very evidently, is that the government should hereafter keep its own head in a panic, and refrain from fruitless meddling, asked by terror-stricken people, simply on the ground that "something must be done." Secretary Cortelyou, defending last November's operation, later on, in response to a Senate resolution of inquiry, argued that "the most potent weapon" available for stopping panic "is often as much one of moral effect as of the definite action taken," and he pointed out, by way of illustration, the British government's suspension, in the London panic of 1866, of the bank act, limiting Bank of England circulation. But the two cases are not really analogous. Our banking law already provides for such leniency by the government, in the clause which declares that the Comptroller of the Currency *may*, but not *must*, call national banks to account for impairment of their 25 per cent. reserve against deposits. The perfectly understood purpose of this wording was to enable the banks, with the full approval of the government, to use their cash reserves to the uttermost in a real emergency. It is exactly for that purpose that the reserve fund is created. It has been argued, subsequently, that the Danish government took a hand, with good results, in last autumn's Copenhagen panic, through guaranteeing the assets of the banks then subject to a run. But this argument overlooks the point that Mr. Cortelyou, in his prompt and altogether wise use of the Treasury's cash surplus, in the very hour of the October crisis, to relieve the beleaguered New York trust companies, through the banks, did far more than the Danish government, and did it wholly within the law. To undertake, at the moment when the panic was getting under control through the natural process of relief, a clumsy, complex, and probably illegal government operation, was a precedent fraught with peril. Its true analogy was the sudden reissue of retired legal tender notes, by a frightened Secretary of the Treasury, in the panic of 1873; and the best thing that can be said, either of that transaction or of the one of November, 1907, is that both of them failed so completely as to incur the heartiest disapproval even of practical business men.

Ready This Week

Lillie's Development of the Chick

AN INTRODUCTION TO EMBRYOLOGY

By FRANK R. LILLIE, Professor in the University of Chicago.

xi.+472 pp., 250 illus. 8vo.

A connected account of the development of the chick to hatching, fully illustrated. It is so arranged that it can be used both as a text-book and a laboratory manual. The development of other vertebrates is considered only incidentally, as the author believes that a fairly complete knowledge of the development of one form is essential to real understanding of the problems of comparative embryology.

HENRY HOLT AND COMPANY 34 W. 33d St., NEW YORK

NOW READY

Eighteen Years in Uganda and East Africa

By the Right Rev. ALFRED R. TUCKER, DD., LL.D., Bishop of Uganda. With over 50 Full-page Illustrations from the Author's Sketches, several of them in color. In two volumes. 8vo. $8.50 *net.*

LONGMANS, GREEN, & CO., New York

OUR LIBRARY SERVICE

We have recently supplemented our service to Libraries, by procuring Out-of-Print and Scarce Books, and by importing English books.

Our Educational Catalogue contains a full list of Supplementary Reading, indicating the grade to which each title is adapted.

Our Clearance Catalogue contains overstock at special prices, and an alphabetical arrangement by authors of all cheap editions of Recent Popular Fiction and Standard Library 12mos in one list.

Our Library Catalogue of 3,500 approved titles, following A. L. A. lines, is of great convenience to small libraries.

Our Monthly Bulletin notices promptly every new book of importance.

These Catalogues are sent on request.

Three notable features of our service are: Promptness, thoroughness, and low prices.

THE BAKER & TAYLOR CO.

Wholesale Dealers in the Books of All Publishers

33 East 17th St., New York.

THE MOSHER BOOKS CATALOGUE

My New Catalogue, covering every title I have published, 1891-1908 inclusive, is now ready, and will be mailed free on request. It is without question a *bibelot* in itself and as choice a production as I can hope to offer.

THOMAS B. MOSHER
PORTLAND MAINE

Early Western Travels: 1748-1846

The index is the most extensive and elaborate historical index ever published in this country. "The series, therefore, is of more real value than the early prints from which they are taken."—Am. Hist. Rev.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 26, 1908.

The Week.

The official list of contributors to the Republican campaign fund contains few surprises. Preliminary "leaking" had given the public a pretty shrewd idea of its actual contents. It will be well to keep certain of the names handy, when it comes to "claims" upon the new administration, diplomatic or otherwise. Some of the Pennsylvania givers may reasonably be supposed to have been grateful in anticipation of tariff favors to come; but that was to be expected. The largest donors, including Mr. Taft's brother, were practically known in advance. A discerning eye will perceive something like a rounding up of the diplomatic corps, many of whom came down handsomely. Ambassador Hill's contribution of $2,000 may have been intended to prove to the German Emperor that he was not so poor a man as had been represented. The total sum is about what was believed. The $5,000,000 campaign which Chairman Hitchcock thought necessary to plan in the beginning, came down to about $1,700,000, and that amount, in view of the result, appears to have been ample. That is one lesson of great value to be learned from this new publicity. The country knows now that such vast campaign funds as Mark Hanna raised, and as Mr. Roosevelt had four years ago, imply either waste or corruption, or both. We see that a President can be elected for one-third the money which was said to be needful for "legitimate expenses." Another lesson is that no harm would have been done by frank publication of these contributions before the election. Hereafter, that course ought to be pursued voluntarily by the national committees, even if it is not compelled by law. So far as one can see now, there is no greater scandal attaching to the receipt of any of these Republican contributions than there was to some of the Democratic.

There is visible distress among the "friends of the tariff" over the way in which the whole question of revision has been thrown open. They now see themselves faced by free and full debate. This was the last thing on earth they wanted, and the thing above all others which they cannot endure. What they had in mind was tariff revision under a blanket. Perfunctory hearings were to be held, in which each man with a claim on the party would take the bill and sit down quickly and write whatever rate of increase he might like. Then the power of the Republican organization in Congress was to be used to shut off discussion, and to put through the measure. These nicely laid plans have already gone agley. It is now clear that something like an irrepressible conflict over the tariff is before Congress. Public interest is keenly aroused. The spectacle of men calmly asking that the taxing power of the government be put at their service, to increase their profits, no longer passes as a matter of course, an entirely innocent proceeding. People are now shocked by it. Ugly words are applied, such as the "thieves" and "hogs" of Charles Francis Adams. Mr. Taft asked his innocent question, "Where are the consumers?" Mr. Carnegie fired his shot heard round Pittsburgh. The result of all has been to make an end of the projected juggling and secret revision of the tariff. It is plain now that the work has got to be done in the open, that manufacturers will not be permitted to go at midnight to write their own schedules, as they did in the McKinley and the Dingley bills, and that the entire subject is up for thorough investigation and resettlement. No tariff-reformer can ask for a better opportunity than this prospect furnishes. As we said repeatedly during the campaign, such publicity and searching inquiry about the tariff are the first requisites. For eleven years, debate on the matter has been stifled in Congress. Not even the most reasonable and urgent proposal to correct acknowledged absurdities or inequalities in the Dingley bill, could be got out of the morgue of the Ways and Means Committee. But the protectionists are now on the defensive, and will be forced to explain and justify, in the open court of reason, every one of their little schemes to make the country rich by taxing it.

Mr. Taft deserves thanks for the quiet yet forcible way in which he has gone about the business of keeping the pledges which he made in the name of his party. These were regarded by the "standpatters" as only a campaign trick. Since the election, they have been even denying that any promise was made. The Boston *Advertiser* having remarked that the new President had promised that there should be "many reductions" in the tariff rates, the *American Economist*, which stands for the highest, blindest, and greediest protection, rejoined in its issue of November 20:

> We do not understand that Mr. Taft has made any such promise. There is a marked difference between the vague opinion that some of the tariff schedules might properly be reduced and a promise that the schedules shall be reduced. Not having any power to execute it, Mr. Taft would not be likely to make that promise. As President he may, if he chooses, recommend tariff reduction, but he cannot reduce the tariff. Congress alone can do that.

With talk of that kind in the air, it is not surprising that Mr. Taft, as an honest man, has taken occasion to say that he means to be honest about the tariff. He said this in Washington, early last week, and he said it again through Mr. Burton last Sunday, when he intimated that he should not hesitate to oppose Speaker Cannon if necessary, in order to carry out the solemn pledge of the party to make a thorough and honest revision of the tariff.

Current press dispatches report that in all likelihood a treaty referring to The Hague court of arbitration all questions affecting the Newfoundland fisheries, will be laid before the Senate at its coming session. This would be an admirable way of settling once and for all certain vexing problems which, like those arising from the tariff, have caused much friction between the two countries. The removal of these grievances would also dispose the Canadians to take fresh interest in proposals from our side to reduce duties on Canadian products. Both their political parties have become advocates of protection. But Sir Wilfrid Laurier has long favored a comprehensive treaty dealing with the tariff and other points of dispute. Now that he has entered upon his final term as Prime Minister, he might well desire to crown his career with so brilliant a

diplomatic achievement. Certainly, Mr. Taft, during his Presidency, could do nothing more useful than to join Canada and the United States by new and far-reaching reciprocity treaties. Free trade between the countries would benefit the whole world by assuring peace between two great neighbors, and by showing how artificial lines may be gradually broken down. Herein lies the greatest value of free trade, and the firmest ground for hope that, despite reverses and defeats, the cause still marches on.

Mr. Bryan's defiant announcement that he will run again for the Presidency in 1912, if "circumstances" once more "force" him into the campaign, removes the last reason for not proceeding forthwith to wrest control of the Democratic organization from his hands. There has been a laudable feeling that one should not be too hard on a man when he is down. Even those most strongly convinced of the need of a new leader and other managers have wished to go about the work of reorganizing the party with due consideration of Mr. Bryan's sensibilities. But apparently he has none. Everybody knows what he means when he says "circumstances." He means retaining mastery of the party machinery. That was the one circumstance which forced assent to his candidacy this year from the reluctant Southern States. Steps ought at once to be taken by self-respecting Democratic leaders in the South to make it clear, even to his complacency, that he can never have that support again.

There are limits to the posturing of even organized labor. At Denver, last week, the report of the committee of the Federation of Labor advocated entire disobedience to court injunctions, with an heroic going to jail rather than submitting. But this was too fantastic for the convention, which voted down that part of the report, three to one. Consequently, it will be left to the individual to decide whether he will give heed to the orders of a judge, or be committed for contempt. An injunction, with other regular processes of the court, being the law of the land, there is no reason why the Federation of Labor, if it resolved to "disregard" injunctions, should not also proclaim its intention of disregarding the laws against assault and battery. But now that the election is over, the sensible view was taken by the majority of the Federation. Hence a labor leader may hereafter refuse to make a martyr or a fool of himself, without danger of being called a "scab."

If adopted just to avoid the appearance of charity, the Carnegie Foundation's plan to pension college teachers without regard to their private means seems hardly necessary. Only a few hypersensitive souls insist upon viewing the endowment as a poor-fund. Everybody else perceives that there is no difference whatever between money given to a college for a chair in physics and money given for a retiring allowance to a professor of physics. The man who accepts as salary the interest on the first sum is just as much and just as little an object of charity as the pensioner. The latter has infinitely less reason for humiliation than the well-to-do lawyer who secures $5,000 worth of education for his son at a cost of $600 in tuition fees. The college professor has earned his pension by hard work; it is only deferred salary. If he cannot accept it as such, consistency will force him to resign at once; for all his academic earnings are equally tainted with benevolence.

A new revolution in Hayti will supply Nord Alexis with another chance within less than a year to show that age cannot wither nor custom stale his fine tropic ferocity. This latest uprising, headed by President Alexis's own military commander in the south of the island, would seem to have been provoked by the action of the President himself when he summoned Gen. Simon to Port-au-Prince for a conference on political conditions. Gen. Simon interpreted the invitation as given in the same spirit that animated Alexander VI when he invited a rich cardinal or two to dinner. Gen. Simon refused to come to Port-au-Prince, and has been declared a rebel. Yet he may have indulged in war-like preparations without treasonable intent against the President. Nord Alexis is over eighty, and since his death would surely be followed by a scramble for the vacant place, a prudent politician and military man might well lay his plans accordingly.

When an English field marshal catches infection his temperature rises just as if he were an ordinary American naval captain or Congressman. Lord Roberts and Richmond Pearson Hobson—it is amazing how the virus of foreign invasion develops the same symptoms in both. Japan grows and adds to her war-strength; obviously she aims at us. Germany is growing and building warships; obviously, she aims at England. Germany has ships with a carrying capacity of 200,000 men "always available in her northern ports," and can gather 200,000 men in the region about her nearest harbor "without trouble." Moreover, Lord Roberts tells his countrymen about the eighty thousand Germans in England, corresponding to Hobson's twenty thousand Japanese in San Francisco, who upon the outbreak of war are sure to pour a dreadful backfire into Britain's serried ranks. What need of specifying just how this attack from behind will be delivered? The German waiters in London will at once begin to serve underdone chops, and so impair the military efficiency of British heroes. German book-stall attendants will force upon their customers the works of Plato and John Locke and sickly o'er their resolution with the pale cast of thought. German tailors will supply British cavalry regiments with uncomfortable riding breeches.

That so fine a soldier as Lord Roberts should not think of checking up his views by the history of war in the past, only shows how far from common sense a man will wander in pursuit of a hobby When, in recent years, has a nation at war received the slightest military coöperation from its subjects resident within the borders of the enemy? One would imagine that our own civil war would have offered such an opportunity. There were in the North tens of thousands who favored the cause of the Confederacy. Yet in spite of vast rumored conspiracies, military assaults, and burnings, no hostile Southern force attacked the Union armies from the rear, no great Northern cities were seized, no cities were burned, no treasuries were looted. This whole method of war by conspiracy is the invention of the imaginative novelists who have recently been waging fearful wars all over the world—for the magazines—and making and unmaking empires. Yet against the dreadful eighty thousand German

waiters, tailors, and clerks, reinforced by their sixty million brethren beyond the seas, Lord Roberts calls for a citizen army of a million men. It is true that only three years ago a committee of defence under Mr. Balfour examined the subject thoroughly and pronounced the fear of invasion nonsense. Things have changed during the last three years, argue the chills-and-fever school of British politicians. Yet what has changed? Britain's engirdling seas are still there. Her fleet is still there. If it's her nerves that are giving way, these same politicians are directly responsible for it.

It is pleasant to turn from armies of a million men and billion-dollar navies to vast amounts of money and large multitudes dealt with in the interests of labor and peace. The Irish Secretary's estimate that it will cost $900,000,000 to carry into full effect the scheme for transferring the soil of Ireland to its cultivators nearly doubles the expenditure foreseen by the authors of the Irish Land Act of 1903. What has been accomplished so far under that act? The champions of war and destruction move forward to the blare of the trumpet. The regeneration of a country's economic life proceeds in humble, humdrum fashion. Mr. Birrell's statement that $125,000,000 has already been expended under the act of 1903, and that loans to the amount of $260,000,000 are under negotiation, is not so illuminating as the record of the actual increase in the number of individual Irish land holdings. From 1890 to 1904 the number of occupiers increased only by 21,000, reaching a total of 545,000 in the latter year. From about the beginning of 1904 to March 31, 1907, a little over three years, there were sold by the Estates Commissioners 4,444 estates to 111,972 purchasers. Allowing for the fact that some of the purchasers were already the possessors of land of their own, the enormous increase in independent fee-holders is apparent.

When Campbell-Bannerman surrendered the Premiership to Herbert Asquith, there came any number of predictions regarding the inevitable dissolution of the Liberal majority, due to take place within anywhere from three months to two years. Campbell-Bannerman's personality alone held the Liberals together; with him gone, etc. But Mr. Asquith has shown that a party may be held together by something else than the gracious qualities of its leader; and those other means are aggressive leadership, tactical skill, and, above all, getting one's party on the right side of broad moral issues. The Liberal government has already placed some notable pieces of legislation to its credit. It is now on the eve of settling one long-fought legislative battle, and possibly two. The latest Education Bill goes to the Lords backed by the great mass of moderate opinion in both parties. It is a compromise measure to which the Church of England, through its highest dignitaries, has consented, to which the bulk of Nonconformist opinion is reconciled, and to which Roman Catholic opinion can be won over. The chances for favorable action by the Lords are therefore excellent. The fate of the Licensing Bill is more uncertain. The tremendous majority with which it passed the House of Commons, shows how deeply stirred is the country over what few care to deny is really a great moral issue. It is, however, a great moral issue pitted against very great special interests, and in the ordinary course of events the Lords' assent would not be forthcoming to a measure that has been denounced as virtual confiscation. But on the Licensing Bill, too, Mr. Asquith has the Archbishop of Canterbury and many influential bishops with him, and Mr. Balfour must needs hesitate before entering into conflict with the Tory party's historic allies.

Emperor William's bowing to German public opinion lends striking confirmation to a letter which Dr. Theodor Barth wrote to the Manchester *Guardian* on November 3. In it, he declared that the Kaiser's power, or even disposition, to withstand the clearly expressed wishes of the German people was "enormously overrated in foreign countries." Dr. Barth has no sympathy with the view of William II's supernatural abilities. The great trouble has been that the Emperor has constantly been supplied with "false information." Surrounded by favorites and flatterers, he has too often been kept in ignorance of the true sentiment of Germany. This is a danger besetting every monarch, and, we may add, every President. There is no one to tell him the truth. But in the present instance the voice of the German people reached the Imperial ear like the sound of many waters, and the Kaiser both heard it and heeded. This result was distinctly foreseen by Dr. Barth, who wrote that the Emperor, with all his pretensions to absolutism, could neither prevent public criticism nor "enforce the consent of public opinion." Dr. Barth takes a large view of the whole affair. It was but a final proof that political conditions in Germany were becoming "unbearable." The nation has made too mighty an advance to be held longer to mediæval notions of government. "It is only a question of time," calmly writes Dr. Barth, "when Germany will be democratized as England, France, and Italy already are." Be it slow or rapid, the process has been sensibly helped by the Kaiser's surrender.

MR. CARNEGIE ON THE TARIFF.

Mr. Carnegie's article in the *Century*, advocating a tariff for revenue only, is one calculated to make hidebound protectionists wish that it, too, had been suppressed. For, say what they will, it is a body blow to them. They have been asking for men who can speak with authority, and here they have got one who throws his authority squarely against them. They have wanted "practical" witnesses, and in Mr. Carnegie they find one without a single trait of the despised college professor or closet-philosopher. Of course, they will abuse him as a "renegade." Indeed, they are already beginning to do so. Senator Burrows of Michigan, for example, is quoted as saying that Mr. Carnegie "made his fortune manufacturing steel under the protective policy of the Republican party," but now "seems disposed to tear down the walls which afforded him protection and enabled him to amass wealth." The sole question with reasonable men, however, is whether Mr. Carnegie, no matter what his attitude in the past, is to-day speaking words of truth and soberness.

In the steel business, he is an acknowledged master. Here his statements are as conclusive as they are distressing—to the high-tariff fanatics. They have talked glibly, but insincerely, of tariff duties designed to equalize the "cost of production," at home and abroad. In especial, they have pointed

to high wages in the United States as making it absolutely necessary to protect the dear workingman. But Mr. Carnegie blows them out of the water with his assertion that steel can be made in this country "cheaper than anywhere else, notwithstanding the higher wages paid per man." He goes on: "Not a ton of steel is produced in the world at as small an outlay for labor as in our own country." This is heartrending. But worse is to come, for Mr. Carnegie, in defiance of the high protectionists who point to the danger of an inundation of cheap goods from Germany, declares that in Germany to-day the "cost per ton for labor" is "greater than with us, unusually high as our wages are at present." Thus is this stone of the free-traders, rejected all these years by the tariff-builders, made the head of the corner. We can but hail Mr. Carnegie's aid in enforcing a truth which trained economists have long maintained, but which our law-makers have sneered at. With them, it has been axiomatic that higher wages mean higher labor cost. Mr. Carnegie shows that they may often mean a lower. His article should be a kind of surgical operation on the heads of protectionists, which cannot fail to make their brains work better, and we may even hope that it will improve their morals.

The confusion wrought in the high-tariff camp by Mr. Carnegie's bombshell is highly illuminative of the way in which protective duties are paid. Washington dispatches show the Republican tariff-makers spluttering and running to cover. They cannot and do not deny Mr. Carnegie's facts, but they consider his publication of them "astounding." In other words, their little game is exposed. Hereafter, they will be liable, Congressmen say, to "infinite embarrassment," if they consent to placing steel on the free list, and then stand out for high duties on other manufactures in which their own "States and districts" are particularly interested. The whole log-rolling theory of tariff-construction is revealed in the attitude of Senator Sutherland of Utah. He is bound to demand a high tariff on lead, wool, sugar, and hides, products of his State, and therefore declares that it would be "most unwise" for him to commit himself to "wiping out the duties on the commodities produced in some other State." Apparently, he fears that if Dalzell should lose the steel booty, the enraged Pennsylvanian would compel others to give up their tariff loot, in turn. We see how frankly the tariff is thus confessed to be the result of a combination of special interests.

Low-tariff men and convinced free-traders may well rejoice in the discussion which Mr. Carnegie's article is certain to stir up. It will make the mind of the nation, and even of Congress, more receptive to the truth than it has been before. All that any one can ask is fair debate, with all the facts brought out, and then a willingness to "follow the argument," as Socrates used to say. The argument really leads further than Mr. Carnegie goes. In specifying manufactures of cotton and wool, together with those of glass and china, and fruits, as imports "used almost exclusively by the rich," and arguing that the duties upon them ought to be maintained or even increased, he overlooks entirely the way in which the tariff enables the domestic manufacturer to increase his charges for what the middle classes and the poor are compelled to buy. This reflex action of a high tariff, by which the right to tax the consumer is placed in favored hands, is something which no thorough and honest inquiry can leave out. But that will all come, in time. For the present, it is sufficient cause for congratulation that Mr. Carnegie has sounded his trumpet before the walls of the high-tariff Jericho.

THE LIQUOR QUESTION.

The agitation for the restriction of the liquor traffic is rapidly moving from the South and West to the North and East. The question will soon be, indeed already is, before us in this State. In the last election the liquor interests worked quietly but effectively against Gov. Hughes on the theory that he is "narrow and puritanical," and is therefore likely to sign a restrictive bill. Just after the election—November 12, to be exact—the Lager Beer Brewers' Board of Trade of New York and Vicinity held a meeting and passed resolutions professing "readiness to coöperate with the authorities in the work of practical regulation of the liquor traffic," hoping that "in a short time" objectionable places would be "put out of existence," but protesting against "unenforceable laws" which are urged by "our over-zealous paternalistic friends." Certain it is that, with or without the recommendation of Gov. Hughes, local option bills of one kind or another will be introduced at Albany this winter. In view of this prospect we welcome as an uncommonly timely publication the November issue of the *Annals of the American Academy of Political and Social Science*, devoted to "Regulation of the Liquor Traffic." It contains seventeen papers treating different aspects of the subject, from a general article, "The Local Option Movement," by the Rev. S. E. Nicholson, superintendent of the Pennsylvania Anti-Saloon League, to "The Regulation of the Liquor Traffic in England" by Miss Agnes E. Slack of the National British Women's Temperance Association. Since an adequate summary of such a large and varied miscellany is impossible here, we shall touch upon only two or three points that bear directly on conditions in New York State.

The case for the liquor dealers is presented in "The Saloon Problem," by Hugh F. Fox, secretary of the United States Brewers' Association; and "The Attitude of the Distillers and Wholesale Liquor Dealers on the Regulation of the Liquor Traffic," by David Stauber, secretary of the National Wholesale Liquor Dealers' Association of America. Both writers make the usual professions as to the earnest desire of liquor dealers as a class to conduct saloons "in a decent and orderly manner." Although the more intelligent and far-sighted members of the trade may feel this desire keenly (they are aware that every vile grog-shop is an unanswerable argument for severe restriction), yet we cannot believe that the influential brewers and distillers are united in serious efforts to improve the moral tone of the saloon. If they are, then they have failed lamentably. A large number of saloons are nothing more than agencies for the sale of this brand of beer or that of whiskey; they are conducted much as the virtual owner, a brewer or distiller, wishes to have them conducted; and if in a given locality—say the "Tenderloin" in New York city—systematic law-breaking is profitable, the law will be systematically broken, with the approval, or indeed at the behest, of the wealthy proprietor. This fact it is which makes us skeptical when the liquor men promise to be good if only

they are let alone and allowed to work out their own salvation. Under the present law nothing prevents their making the saloons as virtuous as may be; but the saloons remain plague-spots in the community, centres of drunkenness, licentiousness, and crime. Nothing, we are convinced, can protect our citizens, young and old, but severe restriction.

The sole issue is as to the form of that restriction. Various suggestions are made: high license, State dispensaries, local option (perhaps combined with high license), and prohibition. The last mentioned plan, we are confident, will no longer be seriously urged in our large and populous Eastern States. Prohibition enforced by a general statute, applying to wide areas, containing both densely crowded cities and thinly settled farming country, has been a failure. It is a failure in Maine to-day. In some rural districts the law is enforced with fair success, and the results may be beneficial; but in the long run the law has been scandalously broken in such centres as Portland, Augusta, and Bangor. Nor have our attempts at State dispensaries been very encouraging. One of the most interesting contributions to the *Annals*, "The State Dispensaries of South Carolina," by Niels Christensen, jr., of the Beaufort *Gazette*, tells us that "the State did not succeed as a barkeeper." By way of summary, Mr. Christensen says:

> The dispensary accomplishes much in abolishing the social features of the saloon and the element of private profit that is so potent in pushing sales. But in putting into the hands of public officials the power to purchase liquor, the door for graft is thrown wide open, and through it at any moment may enter corruption that will render the system as evil as the worst.

This is not, of course, the last word on the dispensary; for our experiments have not been conducted long enough and under sufficiently various conditions to enable us to reach a final judgment.

We believe, however, that the most successful of our endeavors thus far have been along the line of local option, and we should be glad to see the New York Legislature pass a really comprehensive measure embodying that principle. The present law certainly works badly. Whatever may be said for it in the hills of Schoharie, does not apply to New York city; and, moreover, the provisions that may be satisfactory near Central Park are often preposterous on the Bowery. The problem of Sunday closing is not the same in Coxsackie and Canal Street. It is for these reasons that we should like to see this State try a local option law that shall be more extensive in scope than most of those now in operation. In the average Western State, the city or town is given the option of "going wet" or "going dry." And in New York it is only fair that towns in which the majority of voters oppose the sale of liquor should have the right to see what may be done by prohibition in a limited area. But we wish also to see a vote, not merely on the question of saloons or no saloons, but, when saloons are admitted, on the hours of opening, both weekdays and Sunday. Only in this way can we find out the real opinion of the vicinage and arouse sufficient interest to secure the enforcement of whatever regulations may be imposed. For one of the worst evils of the saloon to-day is the demoralization of our police and of whole groups of citizens through collusion in violating the provision for closing.

POUREN AND THE RIGHT OF ASYLUM.

While waiting for the Federal authorities to decide whether Jan Pouren, the young Lettish peasant whom the Russian government is so anxious to have retored to its paternal arms, is a political refugee or an ordinary criminal, we may call attention to the extraordinary zeal with which the government of Nicholas II has suddenly set out to vindicate the majesty of the law. Since the beginning of Russian emigration to this country thirty years ago, some two million subjects of the Romanofs have landed in this country. Among them there must have been hundreds, at least, who were fugitives from justice. Yet, Russia was content to let us enjoy her brigands, forgers, horse-thieves, and assassins in undisturbed peace, until their ranks began to be swelled by members of a new criminal class who call themselves revolutionists. Only then did the Czar's government recollect that a treaty of extradition gave it the right to demand the surrender of runaway "criminals." Pouren's case was only a beginning. Apolinaris Alexandrovitch, a youth of eighteen, was recently haled back to Russia for the offence of forging a certificate of advanced academic standing. Two arrests at the instigation of the Russian authorities are reported from Chicago. If the world at large has been led to think that several hundred executions a week were enough to keep Russian justice reasonably employed, it was mistaken. Appetite notoriously grows by feeding, and the Russian government, having established the reign of law within its borders, by means of drumhead courts, military courts, states of major siege, states of minor siege, states of extraordinary security, and states of merely reinforced security, is evidently sighing for new worlds to conquer.

The true object of the present campaign of extradition is not hard to guess. The Russian authorities wish to create the impression that America can no longer be looked to as asylum for enemies of the established order. In Continental Europe, the places of refuge are being steadily circumscribed. Germany has long been surrendering political prisoners to Russia; Switzerland is beginning to do so. The task before the Russian government seems simple. At home, it has stamped out revolution, or driven it underground. Tho main preparations for a new revolutionary campaign must be carried on abroad, as were the preparations for the upheaval of 1905-07. If the world can be closed to the revolutionists, with anything like the effectiveness attained within the Czar's dominions, the autocracy will have reduced to a minimum the chances of further revolutionary opposition. England and the United States are the only two great nations which still offer generous rights of asylum to opponents of political misrule. England, however, is now the close diplomatic friend of Russia. All the more reason why this country should be careful not to withdraw a privilege which, by the very nature of our institutions and our history, we owe to the champions of political progress the world over.

To draw the line between the ordinary criminal and the political refugee accused of acts of violence, is often very difficult. Revolutions are not fought and won by armies composed exclusively of Mazzinis or José Rizals. Not every workman who mounted the Moscow barricades in December, 1905, could have drawn up a convincing brief for constitutional government as against autocracy. Not every Lettish peasant who waged guerilla warfare against the Rus-

sian government and the German feudal landowners in the Baltic provinces kept his hand to the precise measure of violence justifiable in revolution. Thus it is that the principles of political asylum obtaining in this country and in Great Britain make explicit recognition of the inevitably irregular nature of revolutionary warfare. In 1897 John Sherman, Secretary of State, in the course of certain negotiations with Mexico, quoted from a judicial decision in the Federal courts:

> One cannot look too hardly and weigh in golden scales the acts of men hot in their political excitement. . . . An act of this description may be done for the purpose of furthering and in furtherance of a political rising, even though it is an act which may be deplored and lamented . . . by those who calmly reflect upon it after the battle is over.

Obviously, the intention of the law is that every chance shall be given to the refugee who pleads his political opinions as a defence against extradition.

Even then the case of the defendant is sufficiently hard. Victorious governments may produce documentary evidence in profusion; a fugitive revolutionist is not likely to carry with him irrefutable testimonials of his identity. The question arises whether the accused was a member of an organized revolutionary party, and witnesses testify to his presence at this or that secret meeting of a revolutionary junta. "Were minutes of the proceedings kept?" "Yes." "Where are they?" Where, in the natural course of events, would the records of a party be, whose members have been shot, hanged, imprisoned, or sent into flight abroad? The revolutionary records are gone, and counsel for the prosecuting government thereupon moves that verbal evidence as to their existence has no weight against the thousand printed folios adduced by *his* client. Often a refugee will refuse to answer questions which may endanger those who are still within the power of the accusing government. At every step the prisoner is handicapped. Not to recognize that such disadvantages rest upon the ordinary political fugitive, is to deny him in fact the right of asylum which we grant him in word. The world is stirring with the forces of political progress. Turkey, Persia, China—who knows, Germany, perhaps—may any day be sending us suppliants for protection, whose greatest guilt will be that they wished well to their country. The open door should not be closed to them, an open door far more important to the general welfare of humanity than one admitting thousands of bales of American cotton goods into Manchuria. Today, the Russian government calls for the surrender of a Pouren, who may or may not be an ordinary criminal. Tomorrow, it may call for the surrender of a Tchaikovsky.

GERMANY'S NEW TAXES.

Not yet done with the internal crisis created by the German Emperor's indiscreet interview in the London *Daily Telegraph*, the Reichstag is compelled to face the duty of imposing new and heavy taxes. The Imperial Ministers have of late years thought imperially, but managed their budgets with but little foresight and wisdom. Hence, it has become necessary to raise for the Empire an additional annual revenue of no less than $125,000,000, while the Prussian Ministry is at the same moment casting about for new means of covering annually a part of its deficit of $50,000,000. The prospects for a happy winter for the taxpayer are not bright; and if he studies the matter he will find that retrenchment and saving are two words wholly unknown to the government. It has regularly incurred, without thought of the morrow, heavier and heavier expenses for army, navy, and colonies, and for the ever-increasing army of governmental employees.

It must be admitted that the Chancellor and his new Finance Minister, Herr Sydow, have found fresh articles to tax with a readiness that must and does make other European ministers of finance envious. At the same time, Germany has had to resort to expedients which will quickly bring this new burden home to the ordinary citizen. Thus there will be a tax on gas and electricity, a partial monopoly of the manufacture and sale of spirits, a tax on beer, a new tax on wines, a tax on advertisements, death duties and a military service tax in connection with these death duties, an increased excise on tobacco, and a radical overhauling of the law of inheritance by which the state takes the places of distant relatives. In addition, there is to be an increased tariff on foreign sparkling wines. Finally, as these taxes will not suffice by seven millions of dollars, the regularly assessed contributions of the individual States to the imperial treasury are to be increased by that amount. For the next five years each State will therefore have to contribute a sum equivalent to 80 pfennigs (20 cents) for every inhabitant. This doubles the present rate, but, to sweeten the dose, the net proceeds of the Imperial trade in spirits are to be credited to the account of the annual assessment of the several States. Then there is to be a new plan of amortizing the Imperial debt, or that part of it which comprises loans for non-productive purposes. Hereafter, it is hoped, it will not be necessary to borrow money for non-productive undertakings, as contrasted with loans for railways, canals, etc., which bring in an income.

Two of these expedients, the limiting of the right of inheritance and the monopolizing of the right to purchase and sell wholesale, as well as to distil and to refine alcohol, obviously smack of the socialistic, and as such may be welcome to the Left of the Reichstag, although the Socialist members know better than any one else how heavily the existing taxes bear upon the working classes. The levies on alcoholic beverages will, of course, be felt with unusual keenness by a people as addicted as the Germans are to wine and beer. Moreover, the gas and electricity tax (5 per cent. of the price to the consumer) will be a genuine hardship to the very poor. Just as the old historic French tax on windows produced almost windowless houses, so this tax will decrease the use of gas and electricity by those who greatly need them. Household and electric bells and alarms, as well as telegraphic and telephonic installations, are exempt; but this will hardly still the outcry over this fresh invasion of the household by the tax-collector. The tax on advertisements applies to all commercial or other business announcements in the dailies, weeklies, and magazines, and to all printed circulars. Dailies must pay a rate ranging from 2 to 10 per cent., according to their circulation; weeklies and monthlies, a flat rate of 10 per cent. Charitable appeals are exempted, and also advertisements, not over five lines in length, for situations. Plainly, there is likely to be a marked falling off in advertisements and consequent coolness of the press toward the new scheme.

From the industrial point of view no less than from the political, this is a particularly inopportune moment to impose new taxes. Owing to the tariff and the Agrarian policy, the cost of living has increased far beyond the normal, the price of meat, particularly, having risen so that hundreds of thousands must go without it. The existing depression bids fair to continue for some time. Hence, the possibility that these new taxes may increase the present disaffection. The German people are long-suffering, but, as has just been shown, their wrath, when once aroused, is to be feared. They know that political power is unequally distributed within the Empire, and particularly in Prussia, where the conservative and Agrarian influences retain control by means of the antiquated suffrage laws—the worst system of suffrage, Bismarck called it, that man had devised. This will probably be the first line of attack, precisely as it was last winter. And the new taxes should also increase the agitation for a Ministry that is more directly responsible to the Reichstag.

A WORD FOR THE TEACHER.

The importance of the teacher is, we are glad to note, receiving much attention in current discussions of education. For many years the air has been filled with talk of methods of pedagogy, syllabuses and outlines, construction of laboratories, plans of rooms for manual training and cooking, arrangements for ventilation, and vertical penmanship. This strong emphasis on the mechanical side has made some of us forget that, after all, the one essential is the competent teacher. We would not undervalue dynamos and fresh air; we would not have our programmes less logically ordered, or our workshops and kindergartens less fully equipped; we are passionate supporters of vertical penmanship (or perhaps it is sloping, this week); but without the inspiring teacher all these paraphernalia are as sounding brass or a tinkling cymbal; and it is true that if we seek first the teacher, all these things shall be added. This, we take it, is the thesis of two books issued within the month: "Personality in Education," by James P. Conover, master in St. Paul's School, Concord, N. H.; and "The Teacher: Essays and Addresses on Education," by George Herbert Palmer and Alice Freeman Palmer. It is the thesis also of various papers and addresses, like that, for example, on "The Humanizing of Study," by President Faunce of Brown, published in the *School Review* for October. We have made great progress in the arts of building and organizing, but far less in the art of securing what Professor Palmer calls "the ideal teacher." We wish, then, that all school boards and superintenddents, all college trustees and presidents, would take as their motto a single sentence from President Faunce's speech: "Above all, we must exalt personality above mechanism in school and college."

This exaltation of personality is the great problem of school administrators to-day. How shall we attract the finest minds and characters to the profession of teaching? We are not doing so now. Too many of our college professors are men of the second and third rank, too many of the instructors in grammar schools and academies, public and private, are of the fourth and fifth rank. One trouble is that we do not pay them enough. This argument we need not elaborate, for our readers are all familiar with it. The teacher's wages are often less than those of a skilled mechanic. He does not earn enough to give his family the social advantages, the opportunities for travel, for visiting picture galleries, for reading and for hearing good music—in short, for all those activities and pleasures of the mind which, for cultivated men and women, are the necessities of life. In the *School Review* of November Prof. Francis W. Kelsey of the University of Michigan complains rather bitterly:

> In the profession of teaching outside of the colleges and universities there is uncertainty of tenure, with which is coupled insufficient remuneration. Every year men of marked success, with an equipment representing a large outlay of time, energy, and money, are forced out of the profession, and young men of promise are deterred from entering it, because they can foresee no time when the rewards of faithful and successful effort will be assured to them.

This statement is exactly true, and it applies to most small colleges as well as to institutions of lower grade. In fine, we shall not get an adequate supply of good teachers till we offer them enough to live on in fair comfort.

But money is not all. Both the teacher and the minister of the gospel find large compensations in the interest and stimulation of their work; they are willing to accept an income far smaller than that of the successful lawyer, merchant, or banker. "Those are fortunate," says Professor Palmer, "who are able to devote their lives to its enriching study." Yet even in towns which cannot afford at present to pay teachers suitable salaries much may be done to make the calling more attractive. In many places, particularly outside of New England, the profession is not highly regarded. The prosperous pork-packer or manufacturer of steel rails looks with ill-concealed contempt on a man or woman who deliberately chooses a career in which the acquisition of wealth is impossible; and the prosperous pork-packer is likely to set the social tone. As a result, the teacher and his family, who may be among the most cultivated and agreeable people of the place, receive little or no social consideration. This phrase we use in its broadest sense. We would not suggest that the schoolmaster and his wife would be rendered any happier or more contented with their lot if they were patronized by Mrs. Porkpacker and invited to join the rabble at her pink teas. But we believe that the schoolmaster and mistress would have a more dignified and enjoyable career if their intelligent and well-educated neighbors would make more of them, would take the trouble to seek them out and discover their accomplishments and attainments. The teacher is usually modest and retiring, and is only too keenly aware that he cannot freely contribute money to the community enterprises. But he can, if called on, generally offer what is even more valuable in the conduct of boards, committees, and clubs—devotion and a trained mind. The teacher ought, outside the walls of his school, to be one of the most useful and well-esteemed of persons; if he is thrust into a corner, the fault is often that his neighbors have been too stupid or indifferent to detect his worth.

And there is one other point to which we have referred in times past—the adjustment of the teacher's tasks so as to allow a little energy and time for study and reflection. The man of scholarly tastes is often not attracted to teaching because he knows that, in addition to the privations of the career, he will really be so overburdened that anything like scholarly pursuits will be impossible. He will be robbed of the legitimate perquisites of the calling,

of every chance to keep his soul alive within him. He feels that he might almost as well slice cheese at a handsome profit, and done with it. If our school boards and our college trustees would make it their policy to encourage the man and woman of parts to make something more of themselves than a machine for instructing and disciplining the young, we should get more recruits who have intellectual qualities to develop, and should thus greatly improve our teaching forces, and, through them, our own children.

RECENT FRENCH BOOKS ON HISTORY.

PARIS, October 30.

With October the tide of new publications rises to its full. As usual, the proportion of books on history, grave and gay and controverted, is very large. Let us take those which interest the foreign reader or general student in the order of the centuries of which they treat.

Dom Fernand Cabrol, abbot at Farnborough, England, of an exiled French community of Benedictines, publishes one of those learned works in ecclesiastical history for which his order has so long been famous—"L'Angleterre chrétienne avant les Normands" (Gabalda). "Les Divins Jongleurs," by A. Bailly (Plon-Nourrit) is a series of episodes of the Franciscan *épopée*, from that early period of the fulfilment of St. Francis's description of the brethren: "We are the Lord's wandering minstrels" (for this, and not the modern "juggler," is the equivalent of the Saint's "Nos sumus ioculatores Domini"). This is far, both in time and reverence, from the equally familiar chronicle of *le grand siècle intime*, "De Richelieu à Mazarin (1642-1644)," by Émile Roca (Perrin), although there is something edifying in the religious resignation of Louis XIII to the multiple remedies with which his doctors made sure he should die "regularly." The third and last part of Prof. Fortunat Strowski's great work on the history of religious sentiment in France in the seventeenth century, "Pascal et son temps" (Plon-Nourrit), deals with the writings by which Pascal is best known, "Les Provinciales" and "Les Pensées," each of which has been essentially rejected by the Roman Catholic Church, in favor of whose religion he thought he was working. The author, though a member of the State University, seems to be a Liberal Catholic. Though later in time, the sympathy of the subject places here "Une Suite à l'histoire de Port-Royal," by A. Gazier, who himself deserves to be reckoned the last of the Jansenist writers. The book is from unpublished documents and deals with the years from 1750 to 1782, when the discredited movement ceased acting above ground in face of the opposition of Rousseau's adversary, tho really great pre-revolutionary archbishop of Paris, Christophe de Beaumont. Two publications, noteworthy for the student of Protestantism and religious liberty, are the "Histoire de la révocation de l'édit de Nantes à Bordeaux (1653-1715)," by Paul Bert, a complete documentary work on one diocese; and the third volume of an equally documentary effort from the Catholic side, "Études sur la révocation de l'édit de Nantes en Languedoc—les fugitifs (1685-1715)," by the Abbé Rouquette (Savaète).

In the popular Collection historique illustrée, "La Vie à la Bastille" (Savine) contains the authentic reminiscences of a prisoner, Constantin de Renneville (1702-1713), with illustrations from the French archives. Maurice d'Avray, in "Le Procès du Chevalier de La Barre" (Ficker), tries to prove that the enemies of the Church have made undue capital for their cause from the tragic trial, of which he studies the court records. In any case, it was time such a régime should come to an end, as might be gathered from another book, as light as that is tragic, "Amours d'Opéra au XVIIIe siècle," by the veteran musical critic and historian, Adolphe Jullien (published expensively by Daragon); here the *philosophes* come to their own with Grimm and Mademoiselle Leclerc. "Saint-Domingue (1629-1789)," by Pierre de Vaissière (Perrin), is an extensive volume on Creole life and society in that island during the entire period of colonial life under the Old Régime, with an account of the sons of French nobility who went thither to recuperate their fortunes. One of these, Marquis de La Pailleterie, legitimately married a colored proprietress, Colette Dumas, following the example of many others; and if their son, Napoleon's general, the first Alexandre Dumas, chose his mother's family name rather than his father's title, it was for reasons of safety and patriotism during the anti-noble Revolution; his son, the novelist, was still acknowledged as a legitimate marquis down to 1848, as those who doubt might see in the French peerage of Louis Philippe's time. The book has actual interest for Americans, both from past and present history.

"L'Église de Paris et la Révolution," by P. Pisani, of which the first volume (1789-1792, down to the Massacres of September) has appeared (A. Picard), is the most complete and technically the most intelligent work on its subject; the advantages of its author, a canon of Notre Dame, over Professor Aulard, for example, both in access to documents and the understanding of them, are evident, in spite of his belonging to the side of the slain. The "nationalization" of church property, which the book narrates, may be compared with "La Politique religieuse de la Révolution française," by Émile Lafond, a doctor of laws of the opposing camp, as might be gathered from its preface by Prof. Louis Havet (Rousset). Paul d'Estrée's "Le Père Duchesne" tells from recent authoritative works and from unpublished documents the story of the infamous Hébert and the Commune of Paris during the years of the Terror (Aubert). Jean Drault, a counter-revolutionist of to-day, finds arms for his cause in an interesting episode of the Terror at Lyons, "Le Barbier Gracchus" (Librairie Nationale). Ernest Daudet, an authority of greater weight on the same side, gives another of his books, pleasant to read and valuable from unpublished documents, "Récits des temps révolutionnaires"; it throws new light on the plot of 1800 against the First Consul. "Bibliographie du temps de Napoléon, comprenant l'histoire des États-Unis," by Frédéric M. Kircheisen, treats of the political, economic, literary, and military books of the Napoleonic era, not only in France and the other countries of Europe, but also in the infant United States of America. The first volume is out, the second is in press (Champion).

A book of prime importance on the woman who still holds her own against Napoleon is Paul Gautier's "Mathieu de Montmorency et Madame de Staël" (Plon-Nourrit), based on unpublished letters of the man in the case to the heroine's cousin, Madame Necker de Saussure. Mathieu de Montmorency was already sympathetically known from the life of Madame Recamier; his religion did not lead him to shun those whose lawlessness was endeared by genius. There are few rarer episodes in troubled history than the interruption of his reading of St. Augustine's Confessions at night by the pretended dying struggles of Benjamin Constant, who, in a neighboring room, was striving to win the heart of their masculine-minded hostess. Gilbert Stenger continues his substantial historical work by "Le Retour des Bourbons (1814-1815)"—that short-lived reign of the *émigrés*, beginning at Hartwell and ending in Ghent with a revulsion of the French people to Napoleon, whom only a foreign occupation could depose (Plon-Nourrit). "Lettres du Prince de Metternich à la Comtesse de Lieven (1818-1819)" (Plon-Nourrit), with an introduction, conclusion, and notes by Jean Hanoteau, is a book throwing curious light on the interior of a man whose activity ruled Austrian policy with sentiments usually considered foreign to love until after the middle of the nineteenth century. The countess was not less wonderful, for she wound up with the Calvinist

Guizot in a longer enduring idyll of twenty years' duration. "Lettres inédites de Béranger à Dupont de l'Eure (1820-1854)" is a book of more democratic politics and every-day friendship between the popular poet and the magistrate of the first revolution, who so dramatically reappeared in 1848 (Zaretzky).

A work of high authority in the history of the next upsetting of a régime in France—"Histoire de la guerre de 1870-1871," by Pierre Lehaucourt (General Palat)—now comes to an end with the seventh volume of the first part, on the capitulation of Metz, August 19-December 29, 1870. The eight volumes of the second part, "La Défense nationale," received the highest distinction of the French Academy, tho Grand Prix Gobert, several years ago (Berger-Levrault). Less technical, scarcely less important, are the successive volumes of the Memoirs of Madame Adam, who knew every one in those days and was long in full sympathy with the Third Republic. The sixth volume, "Nos Amitiés politiques jusqu' à l'abandon de la revanche," contains unpublished letters of Gambetta, Rochefort, and Spuller (Lemerre).

The third and fourth volumes of "L'Allemagne religieuse," by Georges Goyau, bring the history of Catholicism in Germany from 1848 to the Vatican Council in 1870. A preceding volume on Protestantism in Germany during the same period received the Prix Bordin of the French Academy; the author, active editor of the *Revue des Deux Mondes*, is a pronounced Catholic, but trained in a school of broad historical criticism. It is doubtful if the subject has been treated so completely hitherto (Perrin). The sweep of its historical examples and conclusions places here a new book of a writer who, in spite of revolutionary views pushed well-nigh to anarchy, has become one of the intellectual forces of France—"Les Illusions du progrès," by Georges Sorel—designed to show that democracy is incapable of directing modern labor (Marcel Rivière). S. D.

ACHILLE LUCHAIRE.

Achille Luchaire, professor of mediæval history at the Sorbonne, died on November 13, at the age of sixty-two. It is a remarkable fact that perhaps the most distinguished mediævalist since the death of Giry was not a graduate of the École des Chartes, but of the École Normale. In 1877 Luchaire took the degree of *docteur ès lettres*, his thesis being upon Alain le Grand, sire d'Albret (1440-1522). This was at once recognized as one of the best works upon provincial history in years, and was crowned by the Academy. Aside from the interest of the subject, it contained much new information from unpublished documents. Molinier, who reviewed it, declared the book too short for the subject, and expressed the hope that the author would continue to devote himself to the neglected field of the history of southwestern France. Instead of so doing, however, Luchaire, who was called to a professorship in the University of Bordeaux in 1879, continued rather along the line of mediæval philology, and followed up his Latin thesis, "De Lingua Aquitanica," in which he had brought forward new proofs in aid of Humboldt's theory of the once wide extension of the Basque race, by a "Recueil de textes de l'ancien dialecte gascon (1882)." Though mainly philological, this brochure contained distinct historical material, for almost all the documents were diplomas and charters of the thirteenth century. But Luchaire had still to find his *métier*.

In 1880 the Academy offered a prize of three thousand francs for the best work upon the subject: "Étudier les progrès du pouvoir royal sous les six premiers Capétiens." Two years later it was announced that Luchaire had won it. In the following year (1883) the first edition of his well-known "Institutions monarchiques de la France" (2 vols.) appeared. The task thus achieved was heavy. Exact knowledge of the political facts, that is to say, examination of the external and general relations of the kingship with the high feudality and with the chief ecclesiastical nobles (the only part of Capetian history then easily accessible), was the first requisite for solution of the problem. But it was necessary also to penetrate into the internal life of the budding kingship for the secret of its evolution, and demand the answer from the whole body of its history. This implied acquaintance with a vast number of chronicles, epistolary documents, diplomas, and charters. To be sure, a certain number of texts had been published in the scientific form which modern criticism demands, but in many cases documents which had been altered by the ignorance or carelessness of the editors had to be newly verified.

Having now found his true field, Luchaire worked with remarkable speed and accuracy. In 1885 he published the "Catalogue des actes de Louis VII," which received the Premier Prix Gobert. In 1888 he was called to the Sorbonne as *professeur-suppléant* to Coulanges, who was then ill to death. Here Luchaire continued in the same path and published a "Catalogue des actes de Louis VI" (1890). Unlike the earlier work, this volume was preceded by an historical introduction of great value. In spite of the paucity and obscurity of the sources, the author managed to invest the figures of Louis VI and Suger with real life and to make vivid portraits. In the same year also appeared a volume of lectures delivered at the Sorbonne—"Les Communes françaises." In 1890 Luchaire was made a full professor of mediæval history. Already he had a group of earnest students around him, and in 1892, as the fruit of research carried on with and for them, he published the "Manuel des institutions féodales," which was dedicated "aux étudiants en histoire de la faculté des lettres de Paris." In 1897 and 1899 appeared two volumes of "Mélanges," a series of studies by Luchaire and some of his students. Those of the master were upon "Hugues de Clers et le 'De Senescalcia Franciæ'" and an inquiry into the manuscripts of the minor works of Suger at the Vatican, together with an interesting study of the "Miracula S. Dionysii," the intimate connection of which with the "Gesta Dagoberti" was demonstrated. Luchaire's valedictory to French history is his masterly portion in Lavisse, "Histoire de France," Vol. II, Pt 2; Vol. III, Pt. 1: "Les premiers Capetiens (987-1137)" and "Louis VII, Philippe-Auguste, Louis VIII (1137-1226)."

It is not often now-a-days that a great historical scholar makes so sharp a *volte face* as Luchaire did in his latter years. And yet the change from Capetian France to the history of Innocent III was not so abrupt as it seems. This thought evidently lay in his mind as far back as 1892. In the preface of the "Manuel," he wrote:

> Les institutions de la papauté, ayant un caractère international, ne rentraient pas davantage dans le cadre d'une exposition qui est consacrée exclusivement à la région française.

In the years 1902-7, Luchaire spent in Rome as much time as he could get from his university duties. In 1904, the first of his four notable volumes upon Innocent III appeared. It was entitled "Innocent III: Rome et l'Italie," and was followed in rapid succession by "Innocent III: La Croisade des Albigeois" (1905); "Innocent III: La Papauté et l'Empire" (1906), and "Innocent III: La Question d'Orient," (1907). In these books Luchaire voluntarily concealed the labor of erudition and seems to have wished them to be at the same time a series of original histories, and a work of literary art. In this, he was distinctly successful. There are few more readable, yet substantial histories than the first 250 pages of Vol. I, in which the figure of the great Pope stands out so life-like. In point of style, the volume upon the Albigensian Crusade is undoubtedly Luchaire's masterpiece. Whoever has seen the country of which he writes will recognize the truth of his description of mediæval Toulouse:

> La ville rouge, énorme reliquaire, avec sa forêt de tours et de clochers, les églises pressées dans son enceinte, Saint Sermin, la merveille des basiliques, toute rosée au soleil couchant, le grand clocher carré de

la cathédrale Saint Étienne et le sanctuaire de la Daurade, étincelant d'or et de mosaïques.

The sole criticism was that Luchaire suppressed his notes and references. In the last volume he was spared to write he therefore returned in part to his old practice and either analyzed or quoted many documents. But the notes were few. True to his time-honored policy, however, he was never dogmatic.

Although Luchaire died while still promising much fruitful work, his end was in one sense peculiarly fortunate. He has left two masterpieces; the subjects of Capetian France and Innocent III are rounded and full. His work lies four-square, substantial, and whole. With him has died the last of that great triumvirate of historians of mediæval France of the elder generation—Arthur Giry, Gaston Paris, Achille Luchaire.

JAMES WESTFALL THOMPSON.

University of Chicago, November 18.

NEWS FOR BIBLIOPHILES.

A collection of manuscripts and autographs belonging to J. Pierpont Morgan will be on exhibition at the Columbia University Library till December 19. Two of the most precious pieces are the manuscript of Tasso's poems and letters, written about 1570, and the original manuscript of the first book of "Paradise Lost." The sheets of "Paradise Lost," in the neat and delicate hand of Milton's amanuensis, show very few corrections—only a word here and there. There is a notebook that Sir Isaac Newton kept in 1659, when he was a youth of seventeen. Some of the pages are covered with algebraic and trigonometric formulæ. In one place, Newton has set down some rules whereby he believes English spelling could be simplified; in another page he gravely tells how easy it is to make birds drunk by feeding them grain soaked in alcohol. Dryden, Pope, Dr. Johnson, and Voltaire are also represented. Among the manuscripts by more modern writers are Scott's "Ivanhoe," "Waverley," "Old Mortality," "The Monastery," and "Tales of My Landlord"; Thackeray's "Vanity Fair"; Dickens's "Christmas Carol," "Sketches of a Young Gentleman," and "Holiday Romance"; Wilkie Collins's "Woman in White," and "The Moonstone"; Bulwer Lytton's "Last Days of Pompeii"; Charlotte Brontë's "The Professor"; Thomas Moore's "Lalla Rookh"; Cooper's "Deerslayer"; Poe's "The Bells," consisting of three or four sheets pasted together; Irving's "Conquest of Granada," and Holmes's "Autocrat of the Breakfast Table." Some of Byron's manuscripts contain many emendations. There is shown also the original warrant under which Bunyan was arrested. One of the most interesting letters is the following:

York, Virginia, 17 Octr., 1781.

SIR: I propose a cessation of hostilities for Twenty-four hours and that two officers may be appointed by each side to Meet at Mr. Moore's house to settle terms for the surrender of the posts of York and Gloucester. I have the honor to be

Your most obedient &
most humble servant,
CORNWALLIS.

His Excellency,
George Washington.

The Library of Congress has recently obtained what is believed to be the original of a decree signed by Philip IV at Madrid, March 22, 1638, assuring to the Duke of Veragua the American possessions discovered by his ancestors. The document was found in New Orleans, where it had been lying in obscurity, presumably for a number of years. The price was so low that doubts were entertained as to its being genuine, but inquiry in Spain showed that such a decree was issued, although no copy remains in the Spanish archives at present. The document consists of a large folio sheet. The paper bears the watermark of the period, and is stamped with the official tax stamp. The writing in the body of the document is exceedingly small, but wonderfully well preserved, and may easily be read by one familiar with Spanish. On the back of the page bearing the royal signature are affixed tracings representing the official signatures of the members of the council of the Indies.

The Chamberlain bibliography of the first editions of Longfellow, compiled by Luther S. Livingston, and just printed at the De Vinne Press (50 copies on Van Gelder paper and 500 on Old Stratford paper), is a story of Longfellow's books. One hundred and four titles are described, with collations, and copious extracts from letters, largely unpublished. Several privately printed issues, heretofore undescribed, which were discovered by Mr. Chamberlain, are included. By the courtesy of Mrs. J. G. Thorp, Longfellow's daughter, Mr. Livingston was allowed to examine Longfellow's own copies of his books, still preserved at Cambridge. Collectors will be surprised to learn how important the series Poems of Places is. The thirty-one volumes include 159 signed poems by Longfellow, besides several others, which are unsigned, but which can be positively identified. Most of these had appeared elsewhere before, but twenty-one at least appeared for the first time in book-form in Poems of Places. The short title, "Check List," which precedes the text, will be found useful by the collector.

The library of Edwin N. Lapham of Chicago (1,517 lots), which will be sold by the Anderson Auction Co. of this city on December 1, 2, and 3, is a remarkable collection, mainly of first editions of English authors of the eighteenth and nineteenth centuries. Of older books there are first editions of Goldsmith's "Vicar of Wakefield" (1766), "The Traveller" (1765), "The Deserted Village" (1770), "The Good-Natured Man" (1768), "She Stoops to Conquer" (1773), and "Retaliation" (1774); Samuel Johnson's "Vanity of Human Wishes" (1749), and "The Prince of Abyssinia" (1759); Sheridan's "The Rivals" (1771), and "The School for Scandal" (1781). The set of "Pickwick" in the original parts is the finest ever sold at auction in this country. Parts 1, 2, and 3 have the correct earliest form of the cover, that of Parts 1 and 2 reading, "With four Illustrations by Seymour," and that of Part 3, "With Illustrations by R. W. Buss." In later issues, as well as the covers of all the later parts, this legend is "With Illustrations." A presentation copy of "A Christmas Carol," first issue, and the scarce pamphlet, "To be Read at Dusk" (1852), are other notable Dickens items. The first editions of Lamb's works include the "Original Letters of Sir John Falstaff" (1796), "A Tale of Rosamund Gray" (1798), "Tales from Shakespeare" (1807), "Mrs. Leicester's School" (1809), "Elia," both series (1823 and 1833), and a presentation copy of "John Woodvil" (1802). The Shelley first editions include an uncut copy, with the blue paper covers bound in, of "Adonais," Pisa, with the type of Didot, 1821; "St. Irvyne" (1811), "Alastor" (1816), "Laon and Cythna" (1818), and "Rosalind and Helen" (1819). Among the Tennysons are: "Poems by Two Brothers" (1827), "Poems" (1833), "Poems" (1842), "Idyls of the Hearth" (a cancelled title of "Enoch Arden," 1864), "The Last Tournament" (private issue 1871), and "Carmen Saeculare" (1887), the first private issue of this Jubilee poem, printed as a "separate" from the types of *Macmillan's Magazine*. A copy of "Vanity Fair," in parts, and "The Second Funeral of Napoleon" (1841) in the original paper cover, are notable Thackeray items. Other authors, represented by important titles are Robert and Mrs. Browning, Carlyle, Coleridge, Thomas Hardy, Leigh Hunt, Keats, Andrew Lang, Charles Lever, George Meredith, Charles Reade, Rossetti, Swinburne, and Wordsworth. Nor can we fail to mention the "Poems" of the Brontë Sisters (1846), with the exceedingly rare first issue of the title-page with the imprint of "Aylott and Jones"; the first edition of FitzGerald's "Rubaiyat of Omar Khayyam" (1859), in the original paper cover; and the first edition of Ruskin's "Poems" (1850).

On December 2 and 3 the Merwin-Clayton Sales Co. of this city offers the library of the late Benjamin Betts of Brooklyn, including Jardine's "Naturalist's Library," 40 vols. (1833-44); Monette's "History of the Discovery of the Valley of the Mississippi," 2 vols. (1846), and Riker's "Annals of Newtown" (1852).

In the sale of the first part of the library of Henry W. Poor by the Anderson Auction Company last week good prices prevailed for most of the important items. Some of the expensive bindings on contemporary unimportant books brought only a small part of their cost. The following are merely selections from the 1,046 lots included in the catalogue, which brought $46,800; A'Beckett's "Comic History of England," first edition, in parts, $77; the Aldine Aristotle (1495-98), 5 vols. in 6, old vellum, $245; the "Commentaria" of Ammonius Hermeus (1503), printed by Aldus and his own copy, with thousands of manuscript notes by him, $255 (this volume brought $160 in the Cox sale in 1902); the Aldine Livy (1518-33), 5 vols., Jean Grolier's copy, with his autograph signature in Vols. I, II, and III, $1,025 (this set was from the McKee sale, where it brought $950); Allot's "England's Parnassus" (1600), $210 ($230 in the McKee sale); a collection of thirty-four autograph letters of the presidents, $930; the "Catholicon" of Balbus de Janua (1460), the first fifty leaves from a later edition, $1,175 ($710 in the Bishop Hurst sale, 1905); Beverley's "History of Virginia" (1705), $180 (an absurd price; the book brought $24 in the McKee sale); Burton's "Anatomy of Melancholy," first edition (1621), $195; Chaucer's Works, London, Kele (n. d.), $180; another edition, London, John Kyngston (1561), $120; Churchyard's "Wars in Flanders" (1578), $101 (the McKee copy, $125); Virgil's Aeneid, translated by Gawin Douglas (1553), $180 (this copy in the Lef-

ferts sale, 1902, brought $235); Hilton's "Scala Perfectionis," printed by Wynkyn de Worde (1533), $121; the first edition of the "Imitation of Christ," Augsburg (1471), $960 (this copy in the McKee sale, $1,600); Lamb's "Tales from Shakespeare," first edition (1807), $221; McCall's Georgia (1811), uncut, $92; a sixteenth century manuscript Book of Hours, with 12 large miniatures and 30 small ones, $990; Milton's "Paradise Lost" (1668), the first edition with the fourth title, $410; Penhallow's "Indian Wars" (1726), original sheep, $490; Jenson's Pliny (1472), $300; Poe's "Tales of the Grotesque and Arabesque" (1840), with A. L. S. inserted, $251; Rossetti's "Sir Hugh the Heron" (1843), $240.

Correspondence.

IN DEFENCE OF THE DENOMINATIONAL COLLEGE.

To the Editor of The Nation:

Sir: The dilemma proposed by President Pritchett of the Carnegie Foundation, and echoed by you in your issue of November 5, respecting the denominational colleges, is that if they have any right to exist it must be either because of a desire on the part of the church to "control and direct" institutions "in which men may grow up trained in its ideals and devoted to its service," or because of "its fitness and efficiency as an educational agency." Both alternatives suggest the claims of the mediæval church, and its spirit as still preserved to some extent in the church of Rome; and both are, of course, in conflict with the educational ideals of our age. But, as in the case of many another apparent dilemma, there is a *tertium quid* which represents the real choice of those concerned rather better than either of the alternatives as presented. I beg leave briefly to state the case for the colleges founded and maintained by various Christian communions, not by way of argument for their further multiplication, but as a demurrer to the contempt with which they are frequently regarded by the enlightened. And I may preface the defence with these explicit admissions: First, that these colleges have frequently been guilty of publishing misleading catalogues, as President Pritchett justly complains; second, that, like churches, they have been absurdly multiplied without reference to local needs; third, that they cannot hope to rival the efficiency of the large and independent universities in what may properly be called university work; and, fourth (by way of anti-climax), that the present writer is fortunate enough to be connected with an institution wholly separate from denominational control, and is heartily content so to be.

The defence proposed for the church college is, in a word, this: the legitimacy of deliberately setting collegiate education in an atmosphere fitted to promote certain desired tendencies in the realm of faith and morals. This reads not unlike President Pritchett's words, "Institutions in which men may grow up trained in [the church's] ideals"; but it is evident from the context that his phrase includes ideals peculiar to the particular denomination concerned, as distinguished from those which it holds in common with other churches, and also that it implies a certain amount of specific training for the utilities of clericalism. Neither of these is included in my statement, which rests merely on the ground that many parents desire, and are justified in desiring, that their children be trained (consistently with due respect for the natural development of individual freedom) along lines parallel with the ethical and religious doctrines which they themselves hold. Is it illiberal if, while wishing for every Jew, Mohammedan, Mormon, or atheist unlimited intellectual and civic liberty, I nevertheless prefer that my child's tutor shall be neither Jew, Mohammedan, Mormon, nor atheist, but Christian? True, I must recognize that the time will come when the child's mind must step out from all external guidance, realizing for itself the whole length and breadth of the possibilities of belief, and choosing whether he will hold to his father's or no. And there are extremists who would start him from the first into this uncharted realm, because of their exaggerated sense of the sacredness of his right of individual choice; but they are so few as to be negligible. Most parents wish to guide their children's thought in matters political, ethical, and religious, at least as long as they guide them in their choice of bodily food. That they should wish their children's teachers to do the same, so far as is consistent with the peculiar demands of non-sectarian public education and like problems, is no mere strange.

The only question, then, is as to the point where this policy ceases to be legitimate—a difficult question, and one which reminds us that the whole matter of the boundaries of school, college, and university is undergoing reconsideration of an important kind. To argue it here is impossible; I wish only to note the fact that many of us who are engaged in university teaching have become aware that the average freshman and sophomore is a vigorous living contradiction of the pleasing hypothesis that he has reached the point where he is prepared to draw his own charts and map out his own course. This is coming to be much talked of on the strictly educational side; it will soon come to be much talked of on the moral side; and, while morals and religion are far from identical, they have not yet been finally divorced. If, then, we are awakened to the suspicion that we had better give some wholesome guidance to the boy of eighteen in his choice of studies, after a period during which we have tried the experiment of turning him loose in the universe of knowledge and bidding him pick for himself, is it not possible that he may still be profitably guided in his choice of recreations, of ideals of conduct, and even of his dominant thoughts as to his relation to the universe and its animating Spirit? Guided, I say, not controlled; and, letting pass altogether the explicit guidance of spoken or printed word, I have in mind above all the guidance of environing personality. For consider whether, if we may reasonably wish that those in a position to influence the boy most strongly be well-mannered in all things, and cultured far otherwise than what is demanded in their actual teaching, we may not also desire that they be religious, whatever "religious" means to us. It is this uncatalogued training which impresses one most in contrasting the heritage of the youth of England with that of America. And surely the time has well passed when the daily uprising of hymn and prayer from the chapels of Eton and Rugby, and of all the colleges of Oxford and Cambridge, meant any inhibition of the intellectual liberty of those being trained within its sound.

There is some defence, then, for the deliberate setting of collegiate education in a religious atmosphere by those who wish it for their children and their children's children. The State cannot do this; the several churches are the only agencies which have done it, or are likely to. Of course, whatever absurdities there are in the multiplication of sects, and in the narrowing or cheapening tendencies of particular creeds, will be reflected, in some degree, in colleges which they may found. But far less, fortunately, than might be supposed. It is doubtful whether, in any large proportion of the numerous American colleges founded and maintained under ecclesiastical auspices, the narrow peculiarities of the creed concerned are emphasized by those in charge, or even well known to the majority of the students. Nor is there much more reason for assuming that the freedom of the members of their faculties is hampered by contributors and administrators, than for the equally prevalent impression that professors in State universities are continually oppressed by politicians and those in privately endowed universities by monopolistic donors. Just here lies the fallacy implicit in the second horn of the alleged dilemma—the theory that the church "has peculiar fitness and efficiency as an educational agency." Of course it has not; neither has the State, heaven knows; neither has Mr. Rockefeller nor Mr. Carnegie. All that any of them can do is to turn over the control of the institution they found to those believed to have such fitness, and this is what has usually been done—quite as often by churches as by States and cities. One could easily name at random, if good taste permitted, one after another of the little colleges which, making only honest pretensions, and not aspiring to the name or the work of the universities, preserve the honorable traditions of a strictly collegiate education with those of a dominant but not tyrannical religious atmosphere.

It need hardly be said that these considerations in no way affect the position of strictly university education, and the obvious reasons why it is neither practical nor desirable that this should be carried on under ecclesiastical auspices. The time certainly comes at length—not to every man, but to all who are fitted to proceed to the higher education—when completely unrestricted individualism is both safe and wholesome, along lines of scholarship, conduct, and religious thinking alike. But, I beg to repeat once more, it is becoming more and more clear that many admirable young fellows are being sent to the university every year who do not belong there—and with painfully serious results. The modern university represents, in what it tries to do for those poured into its walls, a steady outworking of the process of the survival of the fittest; and many of those unfit for its free and irresponsible life would be well cared for in some college of the type now under discussion. The prosperity and development of the type, there-

fore, are not to be treated lightly. Some of us believe that the right direction has been most clearly indicated by President Jordan, in his proposal to cut out from the university system the present freshman and sophomore years, and to keep students of that stage of development under the educational and moral conditions better suited to their immaturity.

RAYMOND MACDONALD ALDEN.

Stanford University, Cal., November 12.

THE RECORD OF THE RHODES SCHOLARS.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* for October 22 Mr. George L. Fox has revived the question of the record of the American Rhodes Scholars. His method has *prima facie* much to commend it. The number of Americans in each honor school, and their classes are given, and then the total number of candidates with the numbers in the class lists. Apparently these statistics prove conclusively that the record as a whole is disappointing. But as I shall attempt to show, the figures present only one side of the story.

In the first place, the name of Lloyd of West Virginia should be added to those who got "firsts" in 1908, his work being in geology; he has also been awarded the Burdett-Coutts scholarship in geology (a "university" honor). Nor is any mention made of the 7 research degrees—4 B. Litt.'s and 3 B. Sc.'s, which have been won by Americans. Mr. Wylie, whose long experience as a don, and whose position as Oxford agent of the Rhodes Trustees, entitle him to be heard with respect, is my authority for the statement that a research degree is fully equal to a first class in an honor school, if it does not stand on a higher plane. In fact, Mr. Wylie was inclined to regard the 5 research degrees taken in 1908 by the scholars of 1905 as roughly equivalent to 8 firsts. If we accept this basis, the American Rhodes scholars can be credited with 20 firsts, instead of 9, as set forth by Mr. Fox. Following his example, I append this roll of honor: In 1907, Tucker Brooke of West Virginia, in English Literature (after one year's work), and Brown of New Hampshire in Physics; in 1908 Armstrong of Maryland in Medicine, Schaeffer of Pennsylvania and Hack of Massachusetts in Classical Archæology, Cronkhite of Rhode Island in Philosophy, and Aydelotte of Indiana in English Literature.

In the second place, many of the figures given for the actual entries and results of the schools are inaccurate. Four candidates are put down for "Greats" (classics), with 3 successes. But the fourth scholar had taken Honor Moderations in his second year, and therefore could not take Greats until the end of his fourth year. The History figures are correct. In Law, instead of 8 there were only 6 candidates, and all got through, instead of 5. The sixth man took the examination at the end of his second year (1906) and secured a second. In the B. C. L. examination, there were 6 candidates, as stated, but one forfeited his scholarship by marrying, and leaving Oxford before the examination, while another passed at the end of his second year, so that all are accounted for instead of only four. Lastly, only 3 out of 4 candidates are credited with getting through in English Literature, whereas the fourth took a first at the end of his second year. In 1908 Mr. Fox finds 8 men "in for" Greats, while only 2 got through. As a matter of fact, 3 of them did not take the examination: 1 resigned his scholarship, 1 was called home a few months before the examination,* and 1 died. And Mr. Fox is wrong in his number 8, for only 7 ever entered for the classical course. Of the 5 men in for History, 3 secured seconds, and 1 a third, instead of 2 in each class, 1 of the seconds being obtained by *two* years' work. In Law 4 men did indeed enter, but 1 resigned his scholarship, and 1 was so seriously injured playing football that he could not proceed with his work; the other 2 achieved the classes accorded them. In regard to Theology, it is only fair to the fifth candidate, who failed to get through completely, to say that he was ill at the time he took the examination, and had to undergo an operation shortly afterwards. There were certainly only 4 men in for English Literature, and 3 got through, the fourth having been called home, and resigned his scholarship before he was half-way through his course. No record is given of the solitary student in Science; as a matter of fact, he took a first class. Then the scholar who was able to get only a fourth in Mathematics is almost laughed out of court. But here again the time usually taken for this course is four years, and the scholar really deserves considerable credit for getting through. Finally, in the case of the B. C. L., instead of the 1 third class, which is credited to 5 candidates, there were 1 second and 3 thirds. And it should be explained that the B. C. L. examination is of an unusually difficult character. It is supposed to be taken only by those who have taken a B. A. in law and have had several years' experience at the bar. It is the most difficult examination at Oxford, and seldom do more than one-half of the candidates satisfy the examiners. In the case of Americans a special dispensation is made, allowing them to enter for the examination without the previous training. One can, therefore, hardly complain seriously if a single Rhodes scholar failed to pass.

What are the conclusions to be drawn from these facts? Instead of 26 successes out of 35 candidates, as Mr. Fox reports for the scholars of 1904, there were actually 30 passed out of 31 who took the schools. Twenty-seven scholars of 1905 took the schools and 23 got through, whereas Mr. Fox finds 15 failures among 34 candidates. Thus, instead of the 24 failures ascribed to the Rhodes scholars by Mr. Fox, there were in reality only 5, and I have attempted to show that in two cases there were extenuating circumstances. There were 10 firsts, 19 seconds, 20 thirds, and 4 fourths. In this connection it may be interesting to quote the *Morning Post* (London) for July 22, 1908: "The number of first and second classes that have fallen to so small a body of men [the American Rhodes scholars] is nothing short of phenomenal." And the 7 research degrees, equal to 10 or 11 firsts, must not be forgotten.

As there were 43 scholars who took up their residence at Oxford in 1904 and 38 in 1905, there remain 17 who have not been accounted for by the schools or the research degrees. Three died in harness, while another, as remarked previously, was incapacitated by injury. One read for the Diploma in Economics, which he obtained; and another read American law without taking either the Law School or the B. C. L. examination. Four resigned their scholarships, for reasons best known to themselves; 2 who were not able to finish their work, as explained above, expect to return to Oxford and do so. One scholar who wished to work for a B. Litt. was compelled by his college first to take a Pass B.A. degree, which he easily did, but he did not have left sufficient time in which to complete his B. Litt. thesis. The four others worked for B. Litt. degrees. One gave up his work in despair because of the lack of sufficient encouragement, while all the notes and bibliography of another disappeared in the British Museum, a few months before leaving Oxford, when it was too late to begin again. Though the other two did indeed fail to secure their degrees, it should be remembered that failing to present a satisfactory thesis for an advanced degree is on a different plane than failure to pass a prescribed examination.

Finally, it may be useful, and in fact only fair, to all Rhodes scholars, past, present, and to come, to speak generally of their position at Oxford. For many reasons the Americans can never be expected uniformly to take first classes. Most of the firsts in the Oxford schools are secured by scholarship men, men who have won their scholarships by competitive examination and have had special training in their subjects long before they come up to Oxford. Particularly is this true in Greats and History. One history scholar whom I knew had done most of English history before he came up, and he is only one of many. And it is notorious that in classical training the American college graduate is behind even the public school man of England. As such men as these set the standard for a first class, it is asking a great deal that every American who goes to Oxford with the general training usually afforded by our colleges and universities should measure up to these trained students who are the pick of the English public schools. The American who has had a special training of any kind is likely to go into research work at Oxford, and therefore cannot show his calibre against the similarly trained Englishman, who is taking the schools in order to get his degree.

But even supposing that an American enters on an equality with the young public-school man, he soon loses it by reason of the peculiar position in which he is placed. Vacation to us means the time for relaxation from college work. The Englishman looks upon it as the opportunity for serious and concentrated study. Oxford's educational and social system is founded on this belief, and hence the plan—so curious to the uninitiated American—which prescribes the days spent at Oxford as the time more especially for recreation and social intercourse, while the hard and telling "reading" is done during the "vacs." Of course, I do not mean to imply that no work is done during term, but one does enjoy unlimited opportunities for intercourse with one's fellow students and

*This scholar intends to return to Oxford this coming June and take his examination.

for breathing that "atmosphere" which constitutes the peculiar charm of Oxford above all other universities of the world, "which not all the wealth of all the multi-millionaires can give to a fledgling of their own creation." This admirable system is understood and bargained for by every Oxonian, but the American Rhodes scholar feels that he must utilize his splendid opportunity, and naturally spends considerable time in travel. The Englishman is content to wait for this indulgence until he has taken his degree, and spends his vacation in serious study. Of course, one meets Oxford undergraduates on the Continent, but they are seldom the men who are working for, or who achieve first classes. Thus the American is placed at a serious disadvantage, yet one cannot blame the man who wishes to see something of the world, and I do not know a single Rhodes scholar who would exchange the experience and knowledge gained by travel on the Continent for several first classes.

Next, the ideals of the individual scholars must be taken into consideration. Not all of them by any means aspire to first classes, for they fully realize the amount of work and undivided attention which this honor postulates. Many of them prefer to divide their energies. One man in my own college was an artist of considerable ability and spent much of his time in Italy and the Louvre instead of putting it all in on schools. I recall another scholar, a very clever fellow, who secured a second. But no one realized more successfully Cecil Rhodes's ideal of his scholars. He visited frequently in the homes of Englishmen and entered strenuously into every phase of his college life. There is not a Rhodes scholar who has contributed more to a better understanding of our country by Englishmen, or who is so thoroughly acquainted with English life and institutions. Still a third man, who took a third, was captain of his college boat club and one of the most popular men in his college. Finally, one may note that many of the scholars spent much time in learning to speak one or more of the modern languages. One scholar became fluent in French, German, Italian, and modern Greek, and many in the first two mentioned. The *Nation*, I am sure, will not quarrel with any one who attained this excellency.

In conclusion I would say that this letter does not represent merely my own opinions and knowledge of the facts, but has been prepared in consultation with three other Rhodes scholars, two of the first American contingent and one of the second, all of whom completed their Oxford courses and are now engaged in educational work in this country. The figures for the schools and other degrees have been taken from the official "Oxford University Gazette." For the rest, it may perhaps be permitted to say that the general consensus of opinion among those who have returned to America after having enjoyed three years' residence at Oxford is that a very generous measure of success has been accorded the scheme of Cecil Rhodes, and, as Mr. Wylie says, that the net results are by no means to be sought in the mere mathematics of firsts.

BERNADOTTE E. SCHMITT,
late Rhodes Scholar from Tennessee.

Madison, Wis., November 13.

AMERICAN NEWSPAPERS A CENTURY AGO.

TO THE EDITOR OF THE NATION:

SIR: The bibliography of journalism in America is a subject that has attracted comparatively few workers; it may interest them and perhaps others to know that the article "Journaux et gazettes politiques dans les États-Unis de l'Amerique," which occurs in *Magazin de littérature européenne*, Tome I, Paris, 1802, is a pertinent item. It is interesting for two or three reasons, one being that it names the editors of the papers and another that it shows the ideas then prevailing in Europe as to the relative importance of cities. For example, it places Philadelphia as the first city of the United States and speaks of cities of the second order as Southampton, Lancaster, and New York. The article praises very highly American editorial work and states that these papers at the end of the year form a general repertoire of information.

THE "HERO" IN LITERATURE AND HISTORY.

TO THE EDITOR OF THE NATION:

SIR: Within the last few months several of Emil Reich's historical works have come into my hands, and I am gratified to find that he lays a great deal of stress on personality as a determining factor in the course of human affairs. While I do not profess to be an historian, I have been a careful and somewhat extensive reader of history. Long ago I became convinced that it is an error to attribute the origin of popular institutions and popular movements to a sort of indefinable *Volksgeist*. Among students of both physical and psychical phenomena it is an accepted maxim that we should explain the past by the present in every case in which the present furnishes the same or similar data. Every important discovery and invention has been foreshadowed by a number of previous discoveries and inventions. Instances may be easily furnished by hundreds. It has been frequently remarked by German critics of Grote's "Greece" that the author's opportunities for seeing the workings of popular government at close range gave him an insight into the Grecian democracies which was lacking to the mere *Stubengelehrter*. We need not be surprised, therefore, that his *magnum opus* still holds its own. It is interesting likewise to find the acknowledgment so often in German books that the English first taught their countrymen the true insight into Homer and formulated a standard by which he should be judged. In his recent book on Homer, Professor Drerup virtually accepts the theory of Grote and other English scholars that there was a Homer, although the Homeric poems were not composed by him in their entirety or in their present form. The Germans seem to have definitely given up the radical theory so elaborately worked out by Lachmann and others which resolved these poems into a collection of lays of unknown authorship. Rohde maintained the essential unity of the poems. Busolt does not express himself very definitely, although he admits that "Die Dichtungen sind wesentlich Kunstpoesie." Beloch takes substantially the same view. While, then, there may have been in vogue many brief popular epics they could be fused into a fairly consistent whole only by one master hand, or at most by two or three. Popular poetry is poetry *for* the people, poetry that expresses the feelings, the national or tribal consciousness. It is composed for the people, not *by* the people.

The same statement is true of great lawgivers. In a somewhat similar sense it may be said that the great legislators of antiquity, like Moses and Lycurgus, codified national aspirations in institutions. It seems probable that in prehistoric and in early historic times the influence of prominent men was greater than at later periods when intelligence became more general and when there were better opportunities and greater inducements for individuals to think and act for themselves. A strong man can more easily influence a group or a tribe than a nation; hence it is a perfectly justifiable assumption that the prestige of the "hero" was greater in remote antiquity than in later ages. The saying of Pope that wit is what oft was thought but ne'er so well express'd is true, in a sense, of great men. They appear at times when their countrymen feel the need of them and are ready to follow their lead or obey their laws. The reason given in the Bible for the choice of Saul as king is an illustration of this condition of affairs. It is reasonable to assume that what holds good of peoples at the present time has always held good; those that do not engender and develop great men remain stagnant. That Sparta at a comparatively early period became the leading state in Greece was due not so much to the obstacles with which that branch of the Dorian race had to contend as to the fact that these obstacles produced a leader whose influence was sufficiently great to bring his countrymen under his sway, and whose life was sufficiently long to make this sway permanent. Such an hypothesis is rendered the more probable by the fact that in subsequent times no man of such force and insight arose as to induce his countrymen to change their ancient constitution when the conditions that called it into existence no longer obtained. Notwithstanding the intense conservatism of the Jews they came in time to see that the maintenance of their peculiar institutions did not depend upon the form of government under which they lived, and that they were religious rather than secular. But that the expectation of an earthly kingdom long survived among them is evinced by the belief and the hope of some of Christ's disciples that He had come to restore their ancient autocracy. If we wish to acquaint ourselves with the history of modern times in war and politics, in the arts and sciences, in literature, in exploration, and discovery, we need but to read the lives of two or three score representative men and we shall find that the ground has been pretty well covered. A crowd may destroy; it takes leaders to build up.

The great man can succeed only when the way has been prepared for him by circumstances and when he is supported by

other men who are only a little his inferiors. The truth of this statement is proved by such examples as Luther, Queen Elizabeth, Louis XIV, Napoleon, and many others. Demosthenes failed because he was born out of due time; he stood in a measure alone. It is, however, in the nature of tradition to lose sight of men of second and third-rate ability and to attribute their words and deeds to him who occupied the foreground. We all know how many stories are credited to Lincoln which he never told because he had gained the reputation of being a capital story-teller. The controversy over many problems of ancient history will doubtless never come to an end; but there has been a marked tendency within the last decade or two to place more reliance on the early records, in the main, than was done a generation ago, Ettore Pais to the contrary notwithstanding.

CHARLES W. SUPER.

Athens, O., November 17.

THE BIBLE AND THE SUNDAY-SCHOOL.

TO THE EDITOR OF THE NATION:

SIR: In the matter of the growing ignorance of the Bible, lamentable alike from a cultural and religious standpoint, I wish to direct attention to the fact that this growing ignorance has fallen in point of time with the growing importance of the Sunday-school, and the extension of the reliance religious leaders have placed upon it in church culture. I think this fact is undeniable, and has not been before noticed. It may be accounted for as accidentally synchronous, or the result of a common underlying cause, or there may be a relation of cause and effect. This is my view after some careful study and observation. I am persuaded that the Sunday-school is itself responsible for this growth of ignorance; because it has drawn to itself the responsibility for the training of the young, a responsibility which, because of its purpose, method, and personnel, it is incapable of filling.

I have but to close my eyes and I see a knickerbockered boy with legs too short to reach the floor of the church, occupied despite protesting kicks with the dominating and cultured words of a distinguished clergyman now dead, whose discourse was windowed with openings into great vistas of Biblical allusion, which, when the boy read the Bible, fastened its meaning eternally in his mind. This in contrast with the modern small boy—mind having danced through the catchy opening hymn, attention occupied with his small boy neighbor, getting his Sunday portion of 5 per cent. Bible, and the rest of the exercises at best cheap moralizing and sometimes unscholarly religiosity. I think the old was better.

Perhaps, too, the cause is general to modern pedagogy. The Sunday-school follows the methods of the public school, and aims to do so; and this raises the query as to the success the public school has in fitting its pupils for the superstructure of knowledge. The answer would scarcely satisfy a careful thinker.

I am convinced that the hope for the future lies in a rethinking of the purpose of the Sunday-school, in the light of its origin, which will lead to a considerable readjustment in the estimation of its value as an agent of Christian training; in a shift of the attention of the Church from its sociological and institutional outlook, a consummation most desirable, to its legitimate function as a leader of worship, and the mould of culture (the charitable and polemic duty of the church is a deplorable accident); and in the return of the child to his father's church, to the gain of child, church, and priest.

These are the thoughts of a pastor, whose lips are weighted because of this Biblical ignorance, and sometimes perversion; and whose heart is sad because the modern child misses so much of the Vision of Eternity, which came to him in his childhood. I do not think I am wrong in the diagnosis. The remedy—well, the priest is always chained; the chains now are the conceit of ignorance, covering misinformation by mere logical analysis and sounding words.

(REV.) OSCAR WOODWARD ZEIGLER.

The Rectory, Durbam Parish, Grayton, Md., November 13.

A BIOGRAPHY OF STEPHEN A. DOUGLAS.

TO THE EDITOR OF THE NATION:

SIR: I am gathering material for a biography of Stephen A. Douglas, and I take this means of appealing to readers of the *Nation* for letters written by Douglas, copies of letters written to Douglas, and pictures of any member of the Douglas family and of persons who came into contact with Douglas in any way. If I may have the loan of anything that might be thought of interest in such a connection, I shall regard the favor highly. I should like to receive suggestions as to personal traits, anecdotes, or any other item, no matter how trifling. In fine, if any person who can throw the least light upon the subject will only write me, he will place me under a deep obligation.

FRANK E. STEVENS.

Sycamore, Ill., November 28.

THE TARIFF AND ANILINE COLORS.

TO THE EDITOR OF THE NATION:

SIR: In an editorial paragraph in your issue of November 19, in discussing the tariff hearings before the Ways and Means Committee at Washington, you say:

> Again, I. F. Stone, Frederick Schoellkopf, and S. Hartford of Buffalo, makers of coal tar colors, ask to have the duty on their product raised from 30 per cent. to 40, and some of their raw material put on the free list—this in the teeth of an admission that under the Dingley schedules they have doubled their plants and their profits.

The "admission" which you mention is apparently a reference to a report of the remarks of Representative De A. S. Alexander. I wish to say that to the best of my knowledge and belief, Mr. Alexander did not say we had doubled our plants and our profits, but that we had doubled our plants and our products, which is true and more than true; and our specific reason for asking an increase in duty was that while we had increased our plants and production as a consequence of the Dingley law, we had unfortunately not increased our profits; the statements of both Mr. Schoellkopf, who preceded me, and myself, before the committee, being that in spite of our increased plants and production our profits were no larger than they were several years ago, when our production was perhaps only a third of what it is at present; the decrease in profits as compared to our production being caused by the increased competition of our foreign competitors, particularly the Germans, who, feeling our increased competition, have reduced prices to offset it until some of the principal colors are sold at or below cost to us, although presumably still at a profit to them. It is for this reason that we ask for additional protection so as to be in a position to be on an equal basis and build up in the United States an industry which will be of as much importance here as it is in Germany.

The logical sequitur is that this additional protection will build up the industry in this country or force the German manufacturers to build factories here, either of which alternatives will be of advantage to this country, it being obvious that with the present duty the Germans can manufacture aniline colors in Germany, pay the present duty, and sell here in competition with American manufacturers, or they would have already established factories here for such competition.

I. F. STONE.

National Aniline and Chemical Co.

New York, November 20.

[The comment in the *Nation* was based on the press report of the hearing. The stenographic report, now issued from the government printing office, shows that, as Mr. Stone says, the word used by Representative Alexander is "products," not "profits."—ED. NATION.]

Notes.

A volume of "Letters and Memorials" of the late Wendell Phillips Garrison, editor of the *Nation*, has been prepared and privately printed at the Riverside Press. From the thousands of letters written with his own hand to his contributors, a sufficient number has been selected to illustrate his frankness and tact, and the wide range of his interests. The volume also contains a brief sketch of his life, several of his best poems, characteristic editorials, reviews, and essays, the letter of appreciation addressed to Mr. Garrison by contributors to the *Nation* on the completion of his fortieth year of service, and a fine photogravure portrait. The book, which will be ready for delivery about December 15, will be sent postpaid on receipt of $1.50. Orders for it may be sent to the office of the *Nation*.

The Oxford University Press announces that it will soon issue a photographic facsimile of part of the famous Codex Sinaiticus. This most valuable Old and New Testament codex, found by Constantine Tischendorf in 1844, in the Monastery of St. Catharine, on Mt. Sinai, later presented to the Czar of Russia, and now in the Imperial Library, St. Petersburg, was issued by Tischendorf, in an accurate transcript, with type cut to imitate the manuscript. Now the generosity of various societies in Oxford, Cambridge, and London, has enabled Professor and Mrs. Kirsopp Lake, of Leyden, to take a set of full-

sized negatives of the New Testament portion. These will be published in 1909 by the collotype process, with a preface by Professor Lake, discussing the palæographical problems and an appendix on the chronology of the Correctors by Professor Papadopoulos Kerameus, the chief of the department of theology in the Imperial Library. The New Testament part of the manuscript, including the Epistle of Barnabas and the remaining leaves of the Shepherd of Hermes, will occupy 296 pages of facsimile. It will be remembered that a few years ago the equally famous Codex Vaticanus was also published by photographic facsimile.

The two important texts of the forthcoming Part VI of the "Oxyrhynchus Papyri," edited by Drs. Grenfell and Hunt, are 300 lines of Euripides's "Hypsipyle," and considerable fragments of a new commentary upon Thucydides.

The American Press Co., of Baltimore, announces a volume entitled "The Poe Cult and Other Papers," by Eugene L. Didier, to be published in honor of the Poe centennial.

Next week the Century Company will publish a book on "The American Executive," by John H. Finley, president of the College of the City of New York.

In December the Johns Hopkins Press will issue "The Adoption of the Fourteenth Amendment," by Dr. Horace Edgar Flack.

We have received from Thomas B. Mosher of Portland a beautifully printed little volume containing Eugene Lee-Hamilton's "Sonnets of the Wingless Hours." Those whose interest was aroused in the work of Mr. Lee-Hamilton by the article in the *Nation* of November 5 will be glad to know that the sonnets are procurable in this neat form.

Crabbe's "Poetical Works" have appeared in the Oxford Edition (Henry Frowde), edited by A. J. Carlyle and R. M. Carlyle. The text is that of the standard edition of 1834. The type is necessarily small, and the pages are printed in double columns. The introduction is unnecessarily commonplace.

Since we noticed the Oxford Thackeray (Henry Frowde) two weeks ago six new volumes have come to our table, including "Ballads and Contributions to *Punch*, 1842-8," "Miscellaneous Contributions to *Punch*, 1843-54," "A Legend of the Rhine," "Christmas Books," "Vanity Fair," and "Pendennis." The text of the novels is from the latest form printed in the author's lifetime, with the omitted portions of the original versions at the end of each volume. Mr. Saintsbury, who furnishes the introductions, writes in his pleasantest vein, but says nothing very memorable. He agrees with those who think Thackeray was a little hard on Becky Sharp, but has sufficient praise for "Vanity Fair" as a whole to satisfy the most ardent admirers of that novel. Over Blanche in "Pendennis" he is enthusiastic; she is one of his heroines, and he will hear no evil of her. Altogether this is an excellent cheap edition.

A reprint of Mrs. Inchbald's "A Simple Story," with an introduction by G. L. Strachey, comes from the Clarendon Press (Henry Frowde). The editor calls attention to the fact that this once popular novel has fallen into an undeserved oblivion, and he says:

> Every one has heard of Fanny Burney's novels, and "Evelina" is still widely read. Yet it is impossible to doubt that, so far as quality alone is concerned, "Evelina" deserves to be ranked considerably below "A Simple Story." But its writer was the familiar friend of the greatest spirits of her age; she was the author of one of the best of diaries, and her work was immediately and immensely popular. Thus it has happened that the name of Fanny Burney has maintained its place upon the roll of English novelists, while that of Mrs. Inchbald is forgotten.

The introduction contains a brief sketch of Mrs. Inchbald's life and literary work. The old title pages are reproduced, and even a publisher's advertisement at the end. The text is that of the fourth edition.

The Fleming H. Revell Company is bringing out a new uniform edition of the novels of "Ralph Connor," of which two volumes, "Black Rock" and "The Sky Pilot," have now come to us. The books are tastefully made, and contain the facsimile of an autograph note by the author, who now for the first time sets his true name, Charles W. Gordon, to the work.

"At Large," by A. C. Benson (G. P. Putnam's Sons) is a volume of essays, the fruit of a summer's solitude in a pleasant grange on the Isle of Ely. Its message, conveyed in English of studied temperance and limpidity, is Mr. Benson's own recipe for sweetening the common lot. The gospel according to Benson is a kind of Paterian epicureanism, subdued and tranquillized by the elimination of ideas. In spite of the author's protest, the critics are right who have declared him, on the intellectual side, thin and platitudinous. But contentment, if we may trust Mr. Benson, lies not in the stressful heat of thought, but in the cool ebb and flow of revery, and in the soft excitement of the senses before fair outward objects—a fragrant syringa bush, a dim cathedral spire, or the yellow sunlight across the meadows at evening. We lay waste our powers in a feverish and unremunerative engagement with the raw material world; we may enrich them by turning the eyes inward, and by a steady effort to see the simple, common things of life in their appropriate emotional vesture. In so far as Mr. Benson represents a reaction against the hectic strenuousness of our times, his influence is timely and refreshing. The growing acceptability of his books indicates a popular demand for professors of a refined, moral, religious if possible, simple, and emotional optimism. The unwholesome element of Mr. Benson's convalescent optimism is its intense self-consciousness. He makes the pursuit of happiness a business. His flowers of felicity, like carnations, demand a hot-house culture, and exhale their perfume only in a specially prepared soil and climate. The true sages have taught that nature is chary of largess to those who hold out their hands in direct solicitation. To ignore this lesson is to repeat the error of Rasselas, Prince of Abyssinia.

James O. Fagan's "Confessions of a Railroad Signalman" (Houghton Mifflin Co.) is based upon a railway experience of twenty-seven years, part of the time as a telegraph operator and towerman, part as chief clerk to a superintendent. In the latter capacity, his duties included the supervision of pay-rolls, the hiring and examination of men, the investigation of accidents, the movement of trains, and the tracing of troubles of every description. With such an experience, a man, if his mind be free from prejudice, should be able to speak on the subject of accidents with authority, and to contribute materially to the solution of the problem. The author fortifies his assertions with frequent illustrations which make a reader feel how little after all separates him from eternity when he takes his seat in a passenger coach. Briefly summarized, Mr. Fagan's conclusions are that there is a general lack of discipline and sense of responsibility among railway employees, and that this condition has been brought about by trade-union organization and dominance. Against the united labor force the superintendent is powerless, for he receives from his superiors no encouragement to resistance. "Harmony dictates the policy of the railroad, the nature and severity of its discipline, while efficiency follows in the rear as best it can." That trade-union influence has been subversive of discipline, no fair-minded person will be disposed to deny. One cannot feel sure, however, after reading this book, that the case for the employee has been fully presented, or that officials have been charged with their proper share of responsibility. This experienced employee sees no hope of relief from the state of armed neutrality into which the opposing forces of labor and capital have brought themselves except through such action by governmental authority as shall bring to light the underlying conditions, and shall punish as criminals those responsible for deaths by accident. Certain it is that the patience of the American public, which has been strained to the breaking point, will not wait much longer upon the voluntary action of the railways themselves.

Those who have found Miss Mary Caroline Crawford's earlier books, "The Romance of Old New England Rooftrees," etc., agreeable reading will not be disappointed in "Saint-Botolph's Town" (L. C. Page & Co.). There are some repetitions from the former volumes; for instance, the paragraph on Mrs. Hutchinson's "parlour talks" (page 114). And the style leaves something to be desired, being, to say the least, neither original nor distinguished. But the author keeps herself largely in the background and is content to select and arrange extracts from old records, diaries, and letters, often not easily accessible to the general reader. This Miss Crawford does with tact, discretion, and sympathy. One longs occasionally for a footnote of reference; for example, it would be interesting to know whence Miss Crawford derives her rather extraordinary etymology of the name Botolph (p. 44). The theory stated in the preface, that the life of history is in biography, is one to which we heartily subscribe; and we think Miss Crawford's attempt to embody the history of Boston in a series of portraits of prominent men and women is distinctly successful, though it involves a certain lack of continuity in the historical narrative which, after all, most American readers can supply for themselves. The illustrations, as in Miss Crawford's other books, are very attractive.

The second volume of the "Works of James Buchanan" (J. B. Lippincott Co.) includes his papers to the beginning of 1836 and gives good examples of his legal and political activities. His important report in 1831 on the national judicial powers has been ranked high by Constitutional lawyers, and the editor, John Bassett Moore, wisely prints also the opposing, or majority, report. Buchauan was a good officeseeker, and assiduously cultivated Jackson. One result was his appointment as minister to Russia, in succession to the somewhat erratic John Randolph. It is to be regretted that the instructions given to Randolph are not printed in this volume, for it was under them that Buchanan acted. From his diary and letters we learn that the chief object of his mission was a treaty of commerce. Randolph had made approaches, but that meteoric character would never have sought, as did Buchanan, to instruct the Czar on the beauties of a protective tariff. Believing that a treaty would bring large benefits to Russia, he was surprised that the Czar's ministers did not at once agree with him, and when the treaty was actually signed he magnified the difficulties he had overcome. Good protectionist as he was, he was impressed with the low import duties in Holland, only ½ per cent. advalorem; yet the people "appeared to be happy and contented, and I have yet seen but one beggar on the street." Returning to the United States, he saw the end of his political career, but he was chosen to the Senate, and became an "authority" on foreign questions. It must be admitted that his diary while in Russia was not impressive, and home politics occupied his thoughts at all times. On p. 213 "water-set" should be "water-ret," and the *projet de roi* on p. 478 should be *loi*.

"Porfirio Diaz" (New York: D. Appleton & Co.), by Rafael de Zayas Enriquez, translated by T. Quincy Browne, jr., is the first piece of plain speech about the ruler of Mexico that has lately appeared in a form calling for serious attention. In the purely biographical part, recounting Diaz's early career, military and political, the author—who, by the way, has been an ardent partisan of Diaz—shows himself, except here and there, disposed to interpret everything in favor of his hero. One feels also that the author overestimates the importance of recent agitations and agitators; and that he is blind to the deadening influence of the absolutism that has prevailed—an influence that has been cumulative in a degree not realized by most Mexicans. But in the last few chapters, which deal with present conditions, the author points out existing evils in words uncommonly plain for a Mexican. His remedy, however, for the evils that absolutism has bred is—for Diaz to "regenerate" his country in the few years of life that remain to him! The book may at least be commended to the consideration of those American journalists whose idea of "writing up" Mexico is to repeat the stereotyped tales about Diaz's "marvellous work."

A recent publication in the series of Studies in History, Economics and Public Law, of Columbia University, is entitled "The Enforcement of the Statutes of Labourers, during the first decade after the Black Death, 1349-1359," by Bertha Haven Putnam, instructor in history at Mount Holyoke College. Miss Putnam has endeavored to answer two questions much disputed among students of English economic and social history: first, were the provisions of the statute of laborers legitimate, and secondly, were they effective? For the ten years under review, her answer is that the wages and price clauses of the statute were thoroughly enforced, and that in consequence wages were maintained at a lower level than would have resulted from a régime of free competition; that, on the whole, the legislation was equitable, at least so far as the oral contracts between lords and villeins were concerned, and that the efforts of the courts to enforce these contracts must command modern sympathy and approbation; and, lastly, that the statute in its relation to the whole system of villeinage was not uniform in its consequences, acting as a check in some instances upon the mobility even of the free laborer, and in others, particularly in connection with trials before the justices of laborers, treating the villeins as freemen and so aiding in the overthrow of bondage. In a sense these conclusions, important though they are, must be deemed only tentative until confirmed or modified by a thorough examination of the sources for the period from 1359 to 1381. Miss Putnam suggests that valuable results might be obtained if an investigator were to take a given county, Essex, for example, and exploit all the material bearing on the subject. Faint-hearted students, seeking for royal roads to the doctoral degree, will hardly be encouraged to enter this field by the evidence here given of the labor involved. The essay rests upon a remarkably fine basis of documentary material obtained after long search in the Public Record Office, London, and here printed in part in an appendix of documents occupying 463 pages, or twice the number of the thesis itself. Only students familiar with the conditions attending such a search among the original rolls, memoranda, petitions, sessions records, year books, and the like can appreciate the dreariness and difficulties of the task that Miss Putnam has performed. Quite apart from her main purpose of showing the operation of the system set up to enforce the statute of laborers she has accomplished an exceedingly useful result in calling attention to sources misplaced or unknown and of orienting the entire mass of material necessary for a further investigation of the subject.

R. Nisbet Bain's "Slavonic Europe" (G. P. Putnam's Sons), the latest volume in the Cambridge Historical Series, is not so comprehensive as its title would suggest, being limited to the history of Russia and Poland. Aside from its merits as an intelligent compilation, though not always, apparently, with reliance upon the most recent authorities, the strength of the book is in its account of political and military happenings and its delineation of personal character. On the institutional and social side it is not strong, while the abundance of detail sometimes obscures the main course of the narrative, and in any case does not make the volume entirely easy reading. Russian and Polish names are at best stumbling-blocks to Latins and Teutons, and Mr. Bain does not lessen the difficulty by his preference for less usual forms of transliteration, as well as by some inconsistency in their use. As a whole, however, the volume is a welcome addition to the literature in English of this difficult field.

An anthology of a poetic literature whose existence is scarcely suspected north of Mexico, "Poetas Bolivianos," by Placido Molina and Emilio Finot, is published in Paris (Ollendorff). Frédéric Raisin also makes known, both in text and French translation, two South American poets: "Les Ombres d'Hellas" and "L'Atlantide conquise," by Leopold Diaz of the Argentine Republic; and "Au delà des horizons," by Rufino Blanco-Fombona of Venezuela. Both these poets have been consuls of their countries in Europe. Señor Diaz has been greatly influenced by Heredia, whose translator he is; his sonnet "To the Dead Race" of aborigines is not unworthy of the master. Señor Blanco-Fombona is more romantic; but he too has a sequence of four fine sonnets on Bolivar.

The Reform Verlag of Leipzig begins, under the title of *Universal-Archiv für Wissenschaft und Literatur*, edited by Dr. Ed. Loewenthal of Berlin, a new monthly organ of the Zentralinstitut für Gedankenstatistik und menschliche Wissenserweiterung.

The house of G. Kreysing, Leipzig, has just begun the publication of a new monthly, *Hellenismus*, which is the organ of the Greek National Association called Hellenismos, consisting of educated Greeks living in Germany and Austria. The editor is Prof. S. Moraitis, of Leipzig. The first issue contains among other things a discussion of the recent political upheaval in Turkey and a scholarly essay, "Die Insel Samos einst und jetzt."

In the series edited by Dr. Carl Patsch, Zur Kunde der Balkanhalbinsel (Sarajevo: Kajon), Theodor Ippen has just issued No. 5, "Skutari und die nordalbanische Küstenebene." The author who was for seven years the Austrian consul at Scutari gives the results of his own observations and studies.

Lemcke & Buechner have now an English edition of "Stieler's Atlas of Modern Geography." The maps and their arrangement are the same as in the German original, but the explanations on the maps are given in an English translation on the front page of each map, and the preface and index are also in English.

Under the title "Aegypten zur Zeit der Pyramidenerbauer" (Leipzig: Hinrichs), Eduard Meyer publishes a lecture originally delivered to the Deutsche Orientgesellschaft, in which he outlines the development of civilization in ancient Egypt, from the earliest beginnings about 3300 B. C. to 2500 B. C. Sixteen good illustrations, chiefly of monuments, add to the value of the work. His story includes his inferences from the finds made in Egypt last winter by the representatives of the Orientgesellschaft.

Of Carl Albrecht Bernoulli's "Franz Overbeck und Friedrich Nietzsche: Eine Freundschaft, nach ungedruckten Dokumenten und im Zusammenhang mit der bisherigen Forschung dargestellt," the second volume of 535 pages is just published (Jena: Eugen Diederichs). Since the indiscretions of the first volume roused in the Nietzsche-Archiv of Weimar a storm of in-

dignation, which led to legal proceedings, some passages in the volume have been made illegible by printer's ink, in the approved manner of the Russian censorship. The fourth volume of the "Gesammelte Briefe" of Friedrich Nietzsche has just appeared (Leipzig: Insel-Verlag). The letters are addressed to Peter Gast, whom Nietzsche had heralded as the deliverer of German music from the corruption into which it had fallen through Richard Wagner. Peter Gast, whose reputation as a musician and composer rests solely upon this foundation, is the editor of this volume.

Max von Schenkendorf, author of the greatest patriotic song called forth by the Napoleonic invasion, "Die Wacht am Rhein," and of that other lyric dear to the German heart, "Muttersprache," has been made the subject of a literary study by Elsa Klein (Vienna: Gerold & Co.). Schenkendorf's attitude towards life and towards his country was so distinctly influenced by his mystical and moralizing introspection, that this little book ought to prove interesting reading.

"Die Seligpreisungen unsers Herrn praktisch ausgelegt," by the late Dr Adolf Schmitthenner, of Heidelberg, edited by Heinrich Bassermann (Tübingen: J. C. B. Mohr), is an interpretation and application of the Beatitudes, from the point of view of advanced theology.

To the Kultur series, edited by Dr. Cornelius Gurlitt (Berlin: Marquardt & Co.), some interesting new volumes have been added. Dr. Theodor Kappstein, author of an excellent biography of Rosegger, has written on "Moderne Theologie und Kultur." The small compass of the book hardly gave the author opportunity to do himself justice, and to exhaust his important subject. The work is barely more than an introduction, but it is interesting reading, and in the reminiscent passages is of sufficient lightness to be almost entertaining. There are twelve illustrations; among them portraits of Harnack, Pfleiderer, and other eminent German divines. "Deutsche Mystiker," by Wilhelm von Scholz, is another new volume of the series. The author succeeds in presenting to his readers a more poetical than philosophical conception of the meaning and the mission of German mysticism, as personified by men like Suso and Tauler. It would be interesting to know the source of the illustrations, which in their allegorical mediævalism are singularly well adapted to the subject. The book is well written, as might be expected from the author of the excellent studies of Droste-Hülshof and Hebbel that bear his name.

Prof. G. Dalman, who is in charge of the German Archæological Institute in Jerusalem, writes to the *Theologische Literaturzeitung* of Leipzig that the present High Priest of the Samaritans has assured him that the Hebrew recension of the book of Joshua, which was recently published by Rabbi M. Gaster of London (see the *Nation* of September 17, p. 263), is the work of the High Priest himself on the basis of the Arabic text. The High Priest is amazed at Gaster's assertion that this is a very ancient book, as he himself never pretended that it is.

The visit of Guglielmo Ferrero to the United States makes timely "Nell' America Meridionale" (Milan: Treves), notes and impressions by his wife, Gina Lombroso-Ferrero. This is more than an ordinary book of traveller's impressions; for Signora Ferrero, as befits the daughter of Professor Lombroso, is a keen observer. She describes the tour that she and her husband took in 1907 through Brazil, Uruguay, and Argentina. Everything, whether social, political, industrial, or agricultural, seems to have interested her. She writes fluently, without padding. Her analysis of the Brazilian temperament is particularly searching. The book might well be translated for American readers, who have great need of a better acquaintance with their South American neighbors.

A general meeting of the Archæological Institute of America will be held at the University of Toronto December 28 to 30, in connection with a meeting of the American Philological Association. The following papers, with others, will be presented: "The Temple of Soleb, a New Form of Egyptian Architecture," James H. Breasted, University of Chicago; "The Development of Babylonian Picture Writing," George A. Barton, Bryn Mawr; "Excavations and Repair of Casa Grande," Dr. J. Walter Fewkes, of the Bureau of American Ethnology; "Excavations of 1908 in the Roman Forum and near the Arch of Titus," Harry L. Wilson, Johns Hopkins; "The Date and Place of Writing of the Biblical Manuscripts in the Freer Collection," Henry A. Sanders, University of Michigan; "Visits to the West Shore of the Dead Sea and the Arabah," President Francis Brown, Union Theological Seminary; "A Type of Roman Lamp: Dressel's Forma 25," Samuel E. Bassett, University of Vermont; "Robbia Notes," Allan Marquand, Princeton; "A Little Homeric Problem," William F. Harris, Harvard; "A Heracles Head from Sparta," William N. Bates, University of Pennsylvania; "The Death of Romulus," Director Jesse B. Carter, of the American School of Classical Studies in Rome (to be read by Dean A. F. West); "Notes on a Journey in Issauria," T. Callander, Queens University; "Two North Italian Painters of the Tre-Cento; Altichieri and Avanzo," Philip J. Gentner, former fellow of the Institute in Mediæval and Renaissance Archæology; "The Excavations of Tyuonyi, New Mexico," Director Edgar L. Hewett, of the School of American Archæology; "The Group Dedicated to Daochos at Delphi," Kendall K. Smith, Harvard; "Restoration of the Stoa in the Asclepieum at Athens," Gordon Allen and Lacey D. Caskey, recent members of the American School of Classical Studies at Athens; "A Group of Sculptures from Corinth," Miss Elizabeth M. Gardner, Wellesley; "An Old Jewish Picture of the Sacrifice of Isaac," Charles C. Torrey, Yale; "A Coptic Biblical Manuscript in the Freer Collection," Dr. W. H. Worrell, University of Michigan; "The Quinquinnales," Dr. R. V. Magoffin, Johns Hopkins; "Two Etruscan Mirrors," John C. Rolfe, University of Pennsylvania; "Antiquities from Boscoreale in the Field Museum," Herbert Fletcher De Cou, late of the American School of Classical Studies in Rome; "The History of Writing in Spain," Charles Upson Clark, Yale; "An Œnophorus in Baltimore," Dr. David M. Robinson, Johns Hopkins; "Themes from St. John's Gospel in the Paintings of the Catacombs," Dr. Clark D. Lamberton, University of Pennsylvania; "The So-Called Flavian Rostra," Dr. Esther B. Van Deman, Carnegie Fellow in the American School of Classical Studies in Rome; "Roofing of the Propylæa at Athens," Henry D. Wood, late Carnegie Fellow in the American School of Classical Studies at Athens. An exhibit of facsimile reproductions of the Uncial manuscripts of the Bible has been arranged for the meetings.

The British Academy has made its final arrangements for celebrating the Milton tercentenary. December 8, at a special meeting of the Academy, George Meredith will read a poem, Dr. A. D. Ward, master of Peterhouse, will read a paper on "Milton's Life and Work," and this will be followed by a discourse on "Milton's 'Comus' and its Incinental Music" by Sir Frederick Bridge, illustrated by the choristers of Westminster Abbey. December 9 will bring a special service at St. Mary-le-Bow, Cheapside, with sermon by the Bishop of Ripon, and in the evening a banquet given by the Lord Mayor at the Mansion House. The next day the following papers, to be issued later in book form, will be handed in to the Academy: "Milton and Dante, with Reference to Macaulay's Essay," by W. J. Courthope; "Milton in the Eighteenth Century," by Prof. Dowden; "'Samson Agonistes' and the Hellenic Drama," by the late Sir Richard Jebb; "Milton as Schoolboy and Schoolmaster," by A. F. Leach; and "Milton's Fame on the Continent," by Prof. J. G. Robertson. December 15, "Samson Agonistes" will be performed at the theatre, Burlington Gardens, under the management of William Poel.

The Rev. George Edward Jelf, master of Charterhouse since 1907, died November 19. He was born in Berlin in 1834, and was educated at Charterhouse and Christ Church, Oxford. For many years he was an active clergyman of the Church of England. Among his publications are many popular books of devotion, such as: "Our Treasure of Light" (1874), "Necessary Things" (1875), "Make Up for Lost Time" (1877), "The House of God the Home of Man" (1878), "The Rule of God's Commandments" (1878), "The Consolations of the Christian Seasons" (2 vols., 1880), "The Secret Trials of the Christian Life" (1883), "Hear the Church" (1887), "Work and Worship" (1887), "Mother, Home, and Heaven" (1891), and "Messiah Cometh" (1899). He was also author of "Sound Words, Their Form and Spirit" (1907).

The death is announced, at the age of fifty-seven, of Thomas Greenwood, a member of the firm of Scott, Greenwood & Co., of London, and known for his advocacy of free libraries. His works include "Tour in the United States and Canada," "Eminent Naturalists," "Public Libraries," "Museums and Art Galleries," "Sunday School and Village Libraries," "Greenwood's Library Year-Book," and "Edward Edwards, the Chief Pioneer of Municipal Public Libraries."

Archibald John Little, the well-known British traveller, has died at the age of seventy. He wrote, "Through the Yangtse Gorges," "Mount Omi and Beyond," and "The Far East."

The death is announced of Matthew Blair in his seventy-second year. Mr. Blair published books on "The Paisley Shawl," "The

Paisley Thread Industry," and "The Glasgow Weaving College." He also wrote on various geological topics.

The death of Friedrich Althoff, late Ministerialdirektor in the Prussian Kultusministerium, followed soon upon his retirement from office in order to regain his health, and at a time when his ultimate recovery was looked for with certainty. His twenty-five years of service, during which he assiduously worked for the progress of the Prussian librarles, were marked by a remarkable growth in their usefulness. He took the initiative in certain large undertakings in the interest of a more efficient service, such as the Prussian "Generalkatalog," and the general catalogue of incunabula. His last official act was the creation of the "Beirat für Bibliothekswesen," in the Kultusministerium. He was also aetive in promoting the exchange of professors with universities in this country.

The death is announced in his forty-sixth year of the poet and novelist, Max Wundtke. Among his publications are, "Dunkle Gewalten," "Die unsterbliche Liebe," "Ein schuldvoll Leben," and "Verworrene Bahnen."

NOTES ON BOOKS FOR CHILDREN.—I.

There is little difference in scope and purpose between the books of last year and of this. The fact may indicate one out of two important limitations in our publishers who cater to juvenile readers: either they lack the power of invention, or else they argue that a successful book should serve as a model from season to season, world without end. So it is that the titles and the very *format* of the volumes today are reminiscent. The backs of the volumes present a stolidity that portends no variety. In fiction, the same heroes and heroines have grown slightly older; in travel, the same loquacious parties are peering into new corners. And yet, it is possible to adopt some principles of exclusion, if we bear in mind, regarding fiction, that no power of librarian or critic can prevent Edward Stratemeyer from persisting in his Dave Porter Series, or A. T. Dudley, Joseph A. Altsheler, Everett T. Tomlinson, Edward S. Ellis, and the like from repeating themselves. The process of elimination is carried on, therefore, in the name of novelty

"The only classification I use," a book-lover once said, "is that of size. I like regularity on my shelves." This arrangement applies very well to large books for small folk. The eye is attracted toward W. D. Howells's "Christmas Every Day" (Harper & Bros.), a richly decorative book, rather extravagantly padded with blank leaves, but festive looking. In the telling of this story there is a certain zest that adds spirit to the little girl's wish, and the adventures that result therefrom. One would expect from Thomas Nelson Page something unique in "Tommy Trot's Visit to Santa Claus" (Charles Scribner's Sons), but the events are too evidently constructed in a conventional manner to disguise the stilted moral of the rich little boy and the poor little boy. E. Boyd Smith is the one who seems to have reached the heart of fun in "Santa Claus and All About Him" (Frederick A. Stokes Co.); it is not so much the text which counts as the flat tone color plates that express a humor of situation and expression attractive to both young and old. Mr. Smith will be remembered by his "Story of Noah's Ark." "Familiar Nursery Jingles" (Stokes) is a volume, richly illustrated in color by Ethel Franklin Betts. The drawings are not sufficient in number, however, to aid the jollity of the verses. The very best collection of its kind is "The Big Book of Nursery Rhymes" (E. P. Dutton & Co.), so charmingly and fully pictured by Charles Robinson, who, this year, has added much in attractiveness to "Nella's" fairy story of "Prince Babillon; or, The Little White Rabbit" (Mitchell Kennerley); there is an unfortunate complexity here of decorative border, which detracts somewhat from Mr. Robinson's simplicity of lines. The story, as a fairy romance, possesses a certain charm. But, though the same mould is used, no volume can equal "Alice's Adventures in Wonderland," with pictures by Millicent Sowerby (Duffield & Co.); the story comes as a fresh breeze in the desert of imitation, though this particular volume, in appearance, is not one to attract—there are better editions.

Continuing with the larger books, and beginning with the tastes of the tiny tots, "The Ark that Glue Built," conceived by George A. and Clara A. Williams (Stokes), will furnish a deal of fun for those whose destructive instinct with scissors must have an outlet. The "Ten Little Niggers" of past nursery days is supplanted by "Seven Little Women" (Stokes), in which R. C. Twelvetrees records some obliterating mishaps. In "The Muffin Shop" (Rand, McNally & Co.), by Louise Ayres Garnett, the verses sometimes succeed in rising above the monotony of length; all of Mother Goose's children visit the muffin man, while Hope Dunlap's brush depicts their impressions. "The Happychaps" (Century Co.), whose adventures are drawn by Harrison Cady and sung by Carolyn Wells, are cousins in intent to the Brownies, though they are not fairies. But the happenings are much the same, and the little figures just as grotesque. Mrs. Lucy Fitch Perkins has added to her Dandelion Classics an edition of "Æsop's Fables" (Stokes); her color plates, though poorly reproduced, have the excellent quality of simplicity of design. Hawthorne's "Wonder Book" has likewise been issued in this series, the publishers are wise in keeping their selections of a high standard.

"The Pinafore Picture Book," by Sir W. S. Gilbert (The Macmillan Co.), will bring delight to many readers; not only are Alice B. Woodward's pictures attractive, but the story itself, with lyrics and music, breathes a wholesome atmosphere. If the theatre managers will not give us Gilbert and Sullivan, it is well that the publishers should. Sir William's preface is altogether of a rare quality. A rollicking book is "The Monarchs of Merry England (William I to Richard III)," pictured humorously by W. H. Robinson, and recorded skilfully in verse by Roland Carse (Stokes). We infer that the whole of English history will be thus treated; the information is all there, given in a surprisingly inventive metre. So good-natured are the jokes that the publishers assure us the Princess of Wales has accepted the book for the royal children. And while on the subject of fun, let us record an honest enjoyment of Peter Newell's "The Hole Book" (Harper), which deseribes graphically the disasters following the mischievous handling of a gun by a small boy.

Several large books of verse need to be recorded. M. G. Edgar has selected "A Treasury of Verse for Little Children" (T. Y. Crowell & Co.), an importation of attractive appearance. The inclusions are somewhat strange, showing the compiler more an editor, with personal taste for poetry, than a born anthologist. The volume is pleasingly decorative. No one can dispute Josephine Preston Peabody's title as a writer of charming verse, and "The Book of the Little Past" (Houghton Mifflin Co.), with its full-page color work by Elizabeth Shippen Green, is indeed charming; but, like Mrs. Helen Hay Whitney, she sometimes strains to copy Stevenson, without quite approaching him. The present book is intended for older children, meaning grown-ups, who contemplate what childhood should be. Miss Abbie Farwell Brown is different; she is much nearer the heart of youth. This year, she brings out "Fresh Posies" (Houghton Mifflin Co.) which deserves a warm welcome, if only for the understanding in the verses "Grace Before Meat," with the concluding lines:

O Lord, when I am hungry may I never lack for meat,
And make me always hungry when I sit me down to eat.

"The Orphant Annie Book" (Bobbs-Merrill Co.) with its effective decorations by Ethel Franklin Betts, will be welcomed by all lovers of James Whitcomb Riley; while "Dream Blocks" (Duffield), pictured in Jessie Willcox Smith's usual manner—or mannerism?—is attractively bound; the spirit of this little book is better than the execution of its verse by Aileen Cleveland Higgins.

A book that offers not a little information is Franklin Matthews's "With the Battle Fleet" (B. M. Huebsch), an excellent record of life aboard our men-of-war during the recent long trip. Such views as one obtains in "Christmas with the Fleet," and "Neptune Ahoy!" will interest readers of all ages. "Three Years Behind the Gun" (Century Co.) narrates feelingly the "true chronicles of a 'diddy-box' "; as a record, it reads like a story, and the impressions aboard the Olympia, with Dewey, are simply and feelingly given. To pass from the navy to the army, Maj.-Gen. O. O. Howard has simplified his "Famous Indian Chiefs I Have Known" (Century Co.); these accounts contain a certain adventurous element; chiefs are chiefs whatever the shortcomings in literary style.

The so-called useful literature includes several striking books. Tudor Jenks's "Photography for Young People" (Stokes) is apparently written by one who has followed all the advice he gives. "Harper's Indoor Book for Boys," by Joseph H. Adams, is full of varied suggestion for wood and metal worker. Though meant for little children, Constance Johnson's "When Mother Lets Us Cook" (Moffat, Yard & Co.), whets older tongues with its appetizing receipts—simple things, but none the less toothsome, the interspersed jingles are stilted, but that does the dishes no harm.

In the realm of classies, our notice is drawn to "The Child's 'Rip Van Winkle',"

with colored illustrations by Maria L. Kirk (Stokes), treated in no fantastic style like Arthur Rackham's conceptions, but literally, in fresh, brilliant color, and very direct meaning. The unnamed editor, who did the adapting, assures us that only a few changes have been made, where short words are substituted for long ones. A casual comparison with the original will show the scheme; it is perhaps futile to change "noble height" to "great height"; children are not overparticular as to detail, if the general meaning is distinct. Among reprints of standard poetry we may mention first "The Children's Longfellow" (Houghton Mifflin Co.). The publishers note that though Longfellow is popular in the schools there has "heretofore been no comprehensive collection of the poems best adapted for children's reading." In this selection the arrangement is in general that of the Cambridge Edition. In the case of "Evangeline," "Hiawatha," and "The Courtship of Miles Standish" an excerpt has been made of one or two complete divisions from each. The book is handsomely printed and bound; there are eight full-page illustrations in colors, and decorated title-page, sub-titles, and headings in color. Each year brings a new "Chaucer Story Book," this season's contribution being under the direction of Eva March Tappan (Houghton). The transcription is fairly and faithfully done, but unless the old flavor is attained, the retelling is hardly worth while. That is why Percy Mackaye's modern rendering, though older, is more valuable. It does not foreshorten Chaucer, or take away from his gentle humor. The remarkable fact remains, nevertheless, that Dr. Tappan, though she does a quantity of work, turns out a quality by no means inferior, and certainly not lacking in sincere intention. Her "Letters from Colonial Children" (Houghton) is a clever way of giving a setting to history; she has brought a child's observation to bear on the conditions which confronted the early settlers; she has kept the letters historical on the one hand, yet has not deprived them of their youthful tone on the other. Her third volume, "American Hero Stories," avowedly a history, is less successful, though no less conscientious (Houghton). The four volumes of Louisa M. Alcott's popular Spinning-wheel Series are reprinted by Little, Brown & Co., each with eight full-page pictures. The volumes are entitled "Spinning-wheel Stories," "Silver Pitchers," "Proverb Stories," and "A Garland for Girls." Miss Alcott needs no recommendation; her stories are classics of their kind. The type and paper of this edition are good.

Duffield & Co. import "The Lamb Shakespeare for the Young"; the editor of the series has taken certain slight liberties with the text of Charles and Mary Lamb, and has added thereto in appropriate places excerpts from the plays themselves, a wise move. Still another attraction is the inclusion of the musical settings for the Shakespeare songs, arranged for home and school use. So far, six volumes have been issued in pleasing red covers with gilt stamps. Was it not said of Dr. Johnson that he had perhaps written more books than he had read? Nowhere are we able to find whether Thomas Cartwright is credited with each volume in the Every Child's Library (Dutton), but five are certainly his, and in general they are creditable, though somewhat miscellaneous, except in their heroic intention. "The Old, Old Myths of Greece and Rome" is a concise little work of reference; "Asgood, Midgard, and Utgard," "The Seven Champions of Christendom," and "Sigurd the Dragon-Slayer," are all told with considerable care and feeling, especially in the matter of quotation from sources. The color plates are striking. The Rev. A. J. Church has told "The Æneid" in simple language for boys and girls; the narrative is adequate, but not full-blooded, a point constantly raised by Lamb during the time he was himself retelling "Ulysses" for Godwin; he thought the *terrible* for children a rather fine thing, provided it did not border upon the nauseous. Edwin M. Bacon has a good idea in his "English Voyages" (Scribner), retold from Hakluyt, to draw the attention of young readers to sources of American history; as solid reading the book is not without adventurous interest; it will not be popular, but it is more than a high school reference book, though it should appeal to the high school boy.

STUDIES IN ENGLISH HISTORY.

Early London: Prehistoric, Roman, Saxon, and Norman. By Sir Walter Besant. Pp. x+370. New York: The Macmillan Co. $7.50 net.

This volume, though dealing with the earliest history of London, is the sixth issued of Sir Walter Besant's "Survey of London"; the preceding volumes are: "London in the Eighteenth Century," "London in the Time of the Stuarts," "London in the Time of the Tudors," "Mediæval London: Historical and Social," and "Mediæval London: Ecclesiastical." The present work deals with London from the remotest times to the middle of the twelfth century, when the last of the Norman kings ceased to reign in England. A quarter of the whole volume, devoted to Norman London, would perhaps more properly have come into the mediæval section, for the continuous history of London begins with the Conqueror, and from this time the city may, in comparison with the preceding epochs, be regarded as almost modern.

An opening chapter furnished by Prof. T. G. Bonney treats of the geology of London, describing very clearly the conditions determining the site, and telling something of the traces of prehistoric man found in London and its neighborhood. The Thames ran through a low-lying country, making at high tide a vast marsh, or rather a lake. Signs of lake-dwellings have been discovered, but the age of these has, like most other things in the early history of London, been the subject of dispute: they have been referred to post-Roman times. How did London come by its name? Did it exist at the time of Cæsar's invasion of Britain, and, if so, how is it that he has not mentioned it? Sir Walter Besant contends that, "while London was as yet only a rude hill-fortress, perhaps while it was only a village of lake-dwellers in the marsh, perhaps before it came into existence at all," there was a busy and thriving community higher up the Thames, at Thorney Island, the future site of Westminster Abbey. This explanation we need to account for the fact that the great road from Dover and Canterbury to St. Albans did not touch London, but went through Westminster at Thorney Island. Sir Walter Besant's view that there was here a ford has been strongly contested, but we are not compelled to accept the ford, for a ferry would preserve continuity for the route over the river, as well as a ford, or even better. London was either not in existence, or was not worthy of so much as mention in 55 B. C., when Cæsar invaded Britain; Dion Cassius, who tells the story of the invasion in A. D. 43, is also silent as to London. The question is how to reconcile all this with the fact that Tacitus, writing in A. D. 61, eighteen years later than Dion, describes London as a great and populous place. Sir Walter Besant's solution of the difficulty is that the importance of London was due solely to a great annual fair. This seems to go far towards reconciling facts in seeming contradiction. During the period of the Roman occupation of Britain, London rose to be a place of great importance.

We come now to a most obscure part in the history of London. After the departure of the Romans, the city was ravaged by Saxon pirates and fell into decay: in two hundred years it is mentioned once only, and then merely as a place of retreat of fugitive Britons. "London," says Sir Walter, "was absolutely deserted—as deserted as Baalbec or Tadmor in the Wilderness—and she so continued for something like a hundred and fifty years." This view is not universally accepted: G. L. Gomme, for instance, has in his "Governance of London" contended with all the weight of his learning that after the departure of the Romans London remained essentially Roman in constitution. This view, it is needless to say, is wholly incompatible with the assumption of the desertion of London.

About the end of the sixth century the life of London began again. Sir Walter pictures the manner of the revival:

> The merchants from beyond the seas heard that peace, some kind of peace, had returned to this land; the mouth of the Thames no longer swarmed with pirates, for there was nothing left on which they could prey. From Dover the adventurous merchantmen crept timidly along the coast—there was no enemy in sight; the skipper ventured into the narrow channel between Thanet and the mainland—no ship was there, no sign of pirate craft; timidly he sailed up the broad estuary of the Thames—not a sail did he encounter. There

were no ships; when the Saxon migration exhausted itself, the Saxon forgot straightway the art of shipbuilding, and the mystery of navigation; his ships were to him like those wings of certain insects, which provide for one flight—that achieved, the wings drop off. During the hundred years or more, while the invasion was becoming a conquest, the ships had rotted or been burned. . . . Then these traders landed their cargo and began cautiously to explore the country round, carrying their goods for sale. They found farmsteads dotted about, each containing one family, with its chief, its sons and daughters, and its slaves. They went north and east as far as Ongar and Abridge, and even beyond the great forest. The people received them without any attempt to kill or murder them; they were interested, at least, in the weapons offered for barter.

What more? Trade revived; the foreign merchants came back, the men of Rouen, the men of Bordeaux; and some of the Saxons themselves, forgetting their prejudice against towns, came in to settle and took to trade. Some of the Britons came out of their retreats in the forests and found shelter and freedom and perhaps wealth, in the city. London was founded a second time (pp. 153-4).

Then comes the story of the Danish invasions of the ninth century, leading, in the opinion of our author, to a second desertion of London, enduring till the recovery of the city by Alfred. The siege of London by Cnut offers the problem of his famous trench. This problem affords an illustration of the differences to be found among writers. Maitland, who, about 1740, went diligently over the whole ground, not then built over, convinced himself that the trench, beginning below Rotherhithe, ended at Chelsea Reach, a length of about four miles. Sir Walter attacking the problem with a mathematical formula and a diagram, arrives at the conclusion that "a hundred feet probably represented the whole of the mighty work of Cnut" (p. 189). Not even the formula can convince us that a bridge-head could have been turned in a length of one hundred feet. Perhaps Sir Walter came to doubt, for in a map of Norman London, Cnut's trench is shown with a length of about two thousand feet. The difference between Maitland's four miles and Sir Walter Besant's hundred feet gives a measure of the contradictions to be found on many of the debated points in the history of London. Indeed, the darkness of night hides much of London's early history. Roman pavements lie twenty feet below the present streets; none knows where was the Roman amphitheatre—Sir Walter Besant places it on the north of London, Mr. Gomme in Southwark. But, in spite of blanks, in spite of contradictions, the story of London will never cease to fascinate. Here and there the darkness melts into a dim twilight in which we see moving figures of heroic proportions. Olaf, Swegen, Alfred, Edmund Ironside, Cnut, Edward the Confessor, the great William. There will always be readers for him who essays to pierce the gloom.

The illustrations are numerous, and for the most part excellent, largely from manuscripts of the period described. We are glad that the present volume does not contain, like some of its predecessors, reproductions of modern pictures. We almost feared to find "Alfred Letting the Cakes Burn," or "The Finding of the Body of Harold," those favorite subjects of the early Victorian era. Perhaps the titles of some of the illustrations require revision. One runs, "Saxon doorway, Temple Church" (p. 343), though Sir Walter Besant tells us that "there is not a single stone in the City of London which may be called Saxon" (p. 243).

The House of Howard. By Gerald Brenan and Edward Phillips Statham. 2 vols.; pp. xi.+334; viii.+354. New York: D. Appleton & Co. $6 net.

The Howards and Stanleys may fairly be regarded as the only titled English families to-day whose first admission to the peerage preceded the reign of Henry VII. Most of the old nobility, who had overshadowed the monarchy in the days of the Lancastrians and Yorkists, had been killed off in the wars of the Roses. Those who survived were marked by the first two Tudor kings as their most dangerous foes, and for the most part ruthlessly stricken down—such was the fate of the Staffords, Courtenays, Nevilles, and a host of others. But the Stanleys and Howards were spared. The salvation of the former was the direct result of the timely aid they bore to the Earl of Richmond at Bosworth; but that the latter survived is a matter of some surprise, for the Howards were originally staunch Yorkists. There is some reason to think that the elevation of John Howard to the baronage really occurred under Edward IV, though it has been usual to date that event from his first summons to Parliament as Baron Howard by Henry VI in 1470. In any case, it is certain that he was an ardent supporter of the White Rose during the next fifteen years, that he was raised to the Dukedom of Norfolk by Richard III in 1483, and that he died fighting bravely for him at Bosworth, despite the warning conveyed to him in the celebrated distich:

Jacke of Norffolke be not to bolde,
For Dykon thy Maister is bought and solde.

To such a family as this it could scarcely be expected that the victorious Tudor would show mercy, and it can be no matter of wonder that Henry's first Parliament included in a sweeping act of attainder both the dead Duke of Norfolk and his living son, "styled the Earl of Surrey," forfeiting all their estates and titles to the crown, and declaring Surrey an outlaw, liable to death at his new sovereign's pleasure.

Such was the very inauspicious beginning of the family that was to attain its greatest eminence in Tudor times. That the Howards, in less than half a century, emerged from deadly peril and rose to high estate is due to the ability and subserviency of the son and grandson of the first duke. Both were shrewd and supple men, shifting with the wind, accommodating themselves to new conditions with a celerity which showed their complete realization that their sole hope of salvation lay in absolute submissiveness to the dictates of the triumphant monarchy. The petitions of powerful friends of the former saved him from the gallows to which the act of attainder had condemned him; his military skill, strikingly exhibited in the suppression of a Yorkshire rising against Henry's extortions, terminated in less than four years what had promised to be a perpetual imprisonment in the Tower, and paved the way for his restoration to the Earldom of Surrey aud a part of his confiscated estates. Other services culminating in the glorious victory over the Scots at Flodden, when his bold march to the northward was the essential factor in winning the day, caused his creation as Duke of Norfolk in 1514, and the complete reëstablishment of the family fortunes. But the Howards were still treading on very treacherous ground. It demanded a life-time of cringing subserviency, a marvellous stroke of good luck, and the patient enduring of a six years' imprisonment to secure for the son of the victor of Flodden (the third Duke of Norfolk) the valued privilege of dying in his bed. His Catholicism made court life turbulent after the breach with Rome; his relationship to the only two of Henry VIII's six wives whom that monarch was constrained to behead, rendered his position, on occasions, perilous in the extreme; but by sudden and unscrupulous windings, Norfolk eluded every pitfall till at the very last, on rumors of a Catholic plot, he and his son, the poet Earl of Surrey, were arrested and sent to the Tower. Surrey, despite a brilliant defence, was condemned by a packed court and executed. A bill of attainder against his father was passed through both houses of Parliament in six days, and received the royal assent by commission; the head of the distinguished prisoner would infallibly have fallen on the morning of January 28, 1547, had not the King's death, four hours earlier, placed the direction of the government in the hands of others, who, though even more opposed to Norfolk's principles than was Henry VIII, felt it impolitic to stain the beginning of a new reign by an act of blood. Nor-

folk remained in prison till the death of Edward VI. Liberated at the accession of Mary, he became for a brief time her chief adviser, till his own death in 1554.

The fourth Duke was his grandson (the son of the Earl of Surrey), and met his death in 1572 on the scaffold for complicity in the Ridolfi plot. From his three sons sprang three separate lines of Howards, and the family history becomes extremely complicated. From the oldest, Philip, is descended the present Duke of Norfolk; from the second—Thomas, Admiral in the Azores—the present Earl of Suffolk and Berkshire; from the third—the redoubtable "Belted Will"—the present Earl of Carlisle. A fuller description of the family history during the last three centuries is beyond the limits of the present review. But it is fair to say that the first four Howards exerted more influence on English history than all their numerous descendants put together; and our authors did not err in devoting all of their first volume and more than one-third of their second to the story of the family previous to 1572.

Their book (principally the work of the late Mr. Brenan, and completed after his death in 1906 by Mr. Statham) has many merits. It is interesting, readable, attractively put together, and amply provided with illustrations and genealogical tables. But it is only too easy to see that it is the work of men entirely lacking in the broad historical foundation and scholarship necessary for the production of a book of permanent value on such a difficult subject. Impartiality in dealing with the Howards themselves it is perhaps not reasonable to expect; but one cannot pass without protest the variously, but always unreservedly, abusive characterizations of Henry VIII: at times they are such as might have been expected from the exiled inmates of a suppressed monastery; at others they smack of the New England Sunday-school teacher who boasted descent "from a long line of maiden aunts." The chapter on the Pilgrimage of Grace shows lamentable ignorance of the composition and relative strengths of the different parties at the royal court; and the real cause of Norfolk's temporary retirement after the suppression of the revolt (namely, Cromwell's complete and speedy reassertion of his ascendency) is not once hinted at. Lastly, errors of detail in dates, spellings, and misinterpretations of documents are to be found on nearly every page; though exceedingly easy, it would be unprofitable to cite examples. As it stands, the work has its uses: it gives an adequate account of the history of a very great family, and, though none of its statements should be accepted without confirmation, it contains material that will prove valuable to Tudor historians. These virtues, however, would have been enormously enhanced, and its faults correspondingly diminished, had the book enjoyed the advantage of systematic and scholarly revision.

CURRENT FICTION.

The Hermit and the Wild Woman, and Other Stories. By Edith Wharton. New York: Charles Scribner's Sons.

That accomplished critic, H. D. Sedgwick, has asserted that Mrs. Wharton's most marked traits are her femininity and her cleverness. It must be said that her latest collection of short stories does not suggest an extension in the range of that cleverness. The initial tale, to be sure, is not what might have been expected—a hermit, say, in a Washington Square studio, with a wild woman tempting him across a tea-table somewhere in the upper regions of Fifth Avenue. This is the case of a real hermit in a wilderness, to whom comes, as if from nowhere, a wandering woman to be, not his temptress, but his helper and innocent solace till death parts them. The trouble with the fable is that, after all, it is interesting rather than moving. One has the sense of its simply being another of Mrs. Wharton's amazingly skilful exercises. The succeeding tales indicate, perhaps, an increase of the tendency, first apparent in "The Fruit of the Tree," to deal with some of the serious questions of modern social life in a larger sense of that term than has always interested her. But more striking than this is her growing preoccupation with the irony of things. One fancies these stories told with a faint smile and a slow shake of the head. Nothing "turns out right" in the romantic sense, and yet every dénouement is in accordance with some distinguishable and on the whole acceptable law. An aging and defeated man humbles his will and makes the only sacrifice which remains for him, to the woman who has ruined his life, for the sake of the pure and happy girl who is oddly enough the sound fruit of their wretchedly unsound union. Another man is balked in the fulfilment of his duty to a dead friend by a selfish woman, and makes the only atonement possible by giving up his life in another disinterested cause. A middle-aged woman, American and married, fancies a secret understanding between herself and a young Englishman. They part, but her inner life is transformed by her sense of virtual union with him. She is stripped bare of her illusion, and her last case is worse than her first. And so on: There is no lifting from minor to major, no relieving touch of cheerfulness. The stories are, of course, admirably told; we must hope that their uniformity of key is a coincidence, and that the story-teller's buoyancy has not taken itself off altogether.

The Suspicions of Mrs. Allonby. By Maxwell Gray. New York: D. Appleton & Co.

Whoever, remembering that well-told and interesting story, "The Silence of Dean Maitland," takes up this book with pleasant expectations, is doomed to severe disappointment. In the first place, there is no story, to speak of. A silly little woman, bored with comfortable idleness and depressed by what she elegantly calls "the Flu" (for influenza), insists, against her husband's wishes, on leaving their home in a London suburb for a solitary visit to the Riviera. The account of her journey, with all its little alarms, excitements, and absurdities, is sufficiently amusing, if one can believe that a woman rich enough to buy—and discard—five expensive hats in two weeks and a half could possibly, in these days, be so innocent of travel. From the moment, however, of Mrs. Allonby's arrival at the Mentone *pension* the book becomes merely a chronicle of the daily sayings and doings of a vulgar and insipid boarding-house party, against a background of rapturous but monotonous scene-painting. The farcico-melodramatic methods adopted by the husband to watch over his wife's safety and the introduction of a French *vicomte* masquerading as a head-waiter to win the hand of the landlord's daughter make it impossible to forgive the book its stupidity on account of any pretensions to realism.

The treatment this volume has received at the hands of its publishers—"tirara," "Ameins," "vertiable," "ballad fists," and "fiançe" are among the printers' gems—would excite some indignation if the author's own slovenly style did not so well deserve it. What has happened to "Maxwell Gray" that she can write like this of railway travel at night:

> Surely the winged steeds are now tearing away at increasing headlong speed, and their way is rougher, up hill and down dale, over crag and boulder and chasm; the cradle is rocked less gently and the rhythm of the rapid gallop is not so smooth, else it would be heavenly to fly thus between the pinions of the courser through centuries of calm content, unvexed by thought or care and surely the cadence that seemed now music, now the burden of some sweet old ballad of forgotten days, had declined to the double knock of civilization and hourly deliveries; to file firing, to the racket of the housemaid's morning broom and furniture destruction to summer thunder, to Portsmouth guns?

Cy Whittaker's Place. By Joseph C. Lincoln. New York: D. Appleton & Co.

Here is a pleasant, homely, simple-minded story that gives the reader

much the same sort of enjoyment he would get from a performance of "Sbore Acres" or "The Old Homestead." The scene is laid "down on the Cape," in a village unspoiled by modern industrialism or millionaire summer residents. Every one in Bayport—except "teacher"—is a Bayporter born and bred, and tbat fact alone is singularly restful. Cy Whittaker, the retired sea captain, who restores the old "place," adopts an appealing little waif, defies the Honorable Heman Atkins, Congressman and boss of the district, and comes out generally triumphant over all the powers of evil, is a very likable, independent, humorous old fellow—not so old, either, that he cannot get up a rather pretty little romance of his own. The charm of the book, however, is the dialect. Who that loves to roll the real Yankee speech like a sweet morsel under his tongue can resist the spell of such engaging oaths as "Godfrey scissors!" and "By the big dipper!"? It is not common, or garden, Yankee, either, but the well-salted 'longshore variety; and Mr. Lincoln has with real artistry allowed his characters just enough contemporary slang to make us sure that it is a live tongue and not a phonographic record of other days to which we are listening.

Long Odds. By Harold Bindloss. Boston: Small, Maynard & Co.

The title of this book is skilful in its appeal to the Anglo-Saxon love of fair play that leaps to aggressive interest at the mention of an unequal struggle. The story justifies the interest, for the struggle represented is that of a few determined, disillusioned men against the evils promoted by unscrupulous greed and permitted by ignorant inertia in that continent so fitly called the Dark. Baldly stated, the theme is the carrying out by the Englishman Ormsgill of his resolve to rescue from slavery a number of negroes commended to his care by a dying friend; but the thought aroused strikes below the human type to the underlying conditions that make the story possible. In the character-drawing there is a refreshing absence of the hackneyed, especially among the men. The little Belgian priest, the American medical missionary bitter with a sense of failure, but strong with unconquerable love of man, Dom Clemente, who has learned the wisdom of looking on—these are real creatures of our own kind who lay hold upon our affections. It is to be regretted that the style is marred by mannerisms evidently the result of sheer carelessness.

Many Kingdoms. By Elizabeth Jordan. New York and London: Harper & Bros.

There is no startling originality in these pleasant tales, indeed, at times—notably in "Varick's Lady o' Dreams" and "Lily Bell"—the note is definitely reminiscent, but there are wholesome humor and pathos, and the felicity of description that one has come to expect from Miss Jordan as a matter of course. The emotional range of the book is wide, from downright tragedy to such exquisite fooling as "The Quest of Aunt Nancy." Some of the stories seem to strain for their effect, but much may be forgiven to one who gives us an idyllic farce of such human possibility as the New York honeymoon of the Henry Smiths of Clayton Center, who were so enthralled by city life as epitomized within the walls of their hotel that they could spare no time to carry their observations further.

The People of the Polar North: A Record by Knud Rasmussen; compiled from the Danish originals and edited by G. Herring. Pp. xix+358. Philadelphia: J. B. Lippincott Co. $5, net.

The first Arctic explorer whose aim was, not to reach the Pole, but to study the life of the Polar people, was Knud Rasmussen. For this task, he was admirably equipped, having been born and brought up in Greenland, the son of a Danish missionary, but educated in Denmark. In 1902, he returned to his native land, a member of the Danish Literary Expedition, and spent the next two years in collecting information in regard to the religious beliefs, legends, and history of the Eskimos. This book is a selection from the results of his investigations, which have been recently published in Copenhagen, and though the work does not appeal to the casual reader, it will be deeply interesting to the student of man. The larger part is devoted to an absolutely unexplored field of ethnographical research, a little group of nomads, who are the most northerly people in the world, and till within a few years were completely isolated from the rest of mankind. Recently, they have come into contact with explorers and West Greenlanders—a contact which is the death-note of their unspoiled individuality. They are not a fertile race and are growing steadily fewer in numbers, and our author is not only the first, but probably the last, to make thorough and efficient research into their folk-lore. The fables and legends are largely derived from the native story-teller, whose task is to talk his hearers to sleep:

> The best story-tellers boast of never having told any story to the end. The legends are known to all; it is the grandmother's business to teach them to her grandchildren.

The chief interest of these tales lies in the fact that they are truthful pictures of the life of the people drawn by themselves, and it is a life without a parallel, without aim or purpose except to live. The summer months are spent in getting food for the long winter night, in which the only occupation of the men at least is to eat and sleep. The mental barrenness of this existence is illustrated by the answer given to our author by an unusually intelligent native, who had been with Peary in his attempt to reach the pole. When asked, "What did you think, when you saw the land disappear behind you, and you found yourself out on drifting ice-floes?" "Think?" said Panigpak, astonished, "I did not need to think: Peary did that!" Not only is this life mentally unfruitful, but it is full of tragedies. All travellers bear witness to the cheerfulness and good humor of the Greenlanders. "The mind of the Eskimo can be calm and sunny like the water on a summer day in the deep warm fjords. But it can likewise be savage and remorseless as the sea itself." The author narrates incidents in his own experience, which prove the truth of his assertion, "never have isolation and intellectual stagnation driven people to more insane brutalities." Their religious beliefs, like those of all primitive peoples, are largely characterized by fear. Natural phenomena are personified by evil spirits, who are subject to the control of their magicians. At times, like the Kayans of Borneo, as William Henry Furness, 3rd, describes them in his "Home Life of Borneo Head Hunters," these Eskimos show a timidity about speaking their own names aloud, lest the spirits, hearing, should be able to do the speakers an injury. As regards social customs it is unnecessary to say more than that girls are married at sixteen and become the absolute property of their husbands, who at will can dissolve the connection for a short time or permanently.

The latter part of the volume is devoted to stories and legends told by the West and East Greenlanders, but they do not differ materially from those of the Polar Eskimos. The East Greenlanders' narratives, however, have this interest that they are the memorials of a vanished people, all but one family having migrated from the southeast to the west coast and been absorbed into the population there. Mr. Rasmussen returned to Greenland in 1906, with the intention of making a six-years' tour along the North American coast, as far as Alaska, for the purpose of studying at first hand the still surviving remnants of the Canadian Eskimo that he may learn somewhat, if possible, of their origin and history and reach some definite ethnological conclusions as to the whole race.

The work is sumptuously got up, with twelve colored plates and ninety-two full page illustrations, largely portraits of natives, drawn by Count Harald Moltke, the artist of the expedition. The third member, whose portrait is given, was L.

Mylius-Erichsen, of whose death by starvation on an ice-floe information has recently been received.

All Things Considered. By Gilbert K. Chesterton. New York: John Lane Co. $1.50 net.

Orthodoxy. By Gilbert K. Chesterton. New York: John Lane Co. $1.50 net.

"All Things Considered" contains Mr. Chesterton's comment in thirty-five little essays upon topics of the day ranging from fairy tales to phonetic spelling—it should be mentioned that he is a believer both in fairies and in Samuel Johnson. It is needless to remark that under the cover of neutral titles he lets fly many an arrow at his favorite enemies. In short sallies his persecution of balance and paradox stimulates and amuses without fatiguing. Served separately at breakfast, his skits would impart a zest to coffee and rolls, and send a man to business with a lively smack of the literary world and a secret feeling of intellectuality akin to that enjoyed by subscribers to the *Spectator* in the Age of Anne. Mr. Chesterton pretends that he thinks them quite ephemeral. "If all goes well," he says in his striking way, "this book will be unintelligible gibberish." It is true that these sparkling diatribes have a kind of journalistic and temporal appositeness; but all will never be so well that they will lose their point. The objects of his attack are old foes with new faces. The decadent and materialistic spirit in art, literature, and society is protean, but persistent. Every age must set off its Chesterton against its Shaw. Hazlitt with similar vivacity, Chesterfield with severe Atticism, Addison with the middle style fought many of his battles and said many of his good things before him. It remained for him, the great reconciler of opposites, to combine against the foe Hazlitt's love of childlike simplicity and enthusiasm with Chesterfield's hatred of Bohemian eccentricity and Addison's domestic piety.

The triumphant masterpiece of this exuberant journalist is his reconciliation of himself with Christianity, the account of which is set forth in "Orthodoxy." Daily engaged in the thick of popular intellectual libertinism and vaunting his familiarity with the latest moral and religious heresies, Mr. Chesterton, overhauling his fundamental beliefs, discovers with a shock of surprise that he is body and soul a Christian, devoutly thanks God for beer and burgundy, and plunges into apologetics. His argument, interwoven with the story of his religious experience, is a series of bluish crackling sparks, which breaks at intervals into a steady glow, illuminating perfectly rational and consistent pragmatic positions. His point of departure is what he regards as the "actual fact that the central Christian theology is the best root of energy and sound ethics." Various neologies have had their innings and have failed to comfort, guide, or inspire. One has abolished heaven and hell; another, vice and virtue; and a third, everything else but the ego—they have ended in sentimentality, paralysis of the will, moral anarchy, and the madhouse. The age of interrogation has accomplished its mission: modern thought lies in apathy and despair under the gray evening twilight of philosophic freedom. In this awful juncture, Mr. Chesterton discovers Christianity—sees that for every ill it contains the cure. With its vivid sense of sin, it rouses men to the violent loves and hates that make life worth while. "There must at any given moment be an abstract right and wrong, if any blow is to be struck; there must be something eternal if there is to be anything sudden." Christianity with its emphasis upon free will leads a man to choose a path and sends him down it like a thunderbolt. With its sharp distinction between flesh and spirit and its belief in a divine ruler outside the universe it lifts up the heart from self-contemplation and fills it with wonder and joy in the contemplation of its creator. The right Christian is neither optimist nor pessimist, but both at once in the highest degree of each; his predominant mood, however, is a kind of loyalty to the universe—he is a "cosmic patriot." He is not troubled by minor miracles, for he knows, with Carlyle, that the whole universe is a miracle Mr. Chesterton does not stand for half-measures; he justifies even the Trinity on the grounds of "practical reason." His eye fixed upon the goal, he balks at nothing to get there; he tramples history, Darwinism, anthropology, under foot with fine mirth and bravado. But in morals he is as sound as Moses, and his religion has a ring of chivalry and sincerity. You may be startled, even shocked, by this novel book; but you must admit that the heart of this witty Philistine is in the right place.

The Book of the Pearl: The History, Art, Science, and Industry of the Queen of Gems. By George Frederick Kunz and Charles Hugh Stevenson. New York: The Century Co. $12.50.

This book is an encyclopædia of the pearl. It has, as in the old definition, "unity and circularity of knowledge." The central motive is the evident, and very proper, desire of the authors to make out a strong case for a gem, the finding, distribution, and preparation of which gives more or less regular employment to perhaps a million people; and the beauty of which has been recognized for ages as meriting the best skill of lapidaries, the highest enthusiasm of collectors. That one of the writers has for many years been an expert in precious stones employed by a leading firm of jewelers, accounts, doubtless, not only for the extraordinary personalia occurring in letter press and illustrations—in hardly any recent book is one introduced to so distinguished an assemblage of emperors and empresses, Eastern potentates and wives of American multi-millionaires—but also for the constant endeavor through interesting and often naïve methods of suggestion to prompt readers to acquire, so to speak, the pearl habit. That the other author received his training in the Bureau of Fisheries explains, presumably, his liking for conveying voluminous and always entertaining information about the conditions of the pearl industry in various parts of the world and his persistent urging of the necessity for conservation of the conchological resources of ocean reefs and inland rivers. This note of special pleading, dominant throughout the book, in reality greatly enhances its value to the general reader, informing with a sense of enthusiasm pages which, with their weight—sometimes an over-weight—of facts and figures, might otherwise be deadly dull. There are, it is true, passages here and there of superfine writing; for example:

> Unable to resist, to rid itself of the opposing evil, it [the pearl oyster] exercises the powers given to it by a beneficent Creator and converts the pain into perfection, the grief into glory. Nature has many instances of the humble and lowly raised to high degree, but none more strikingly beautiful than this. One of the lowest of earth's creatures, suffering a misfortune, furnishes a wonderful lesson upon the uses of pain and adversity by converting its affliction into a precious gem symbolical of all that is pure and beautiful.

The work as a whole, however, is fairly readable. In quantity and quality of information it should be accounted as one of the most notable works yet produced on a topic connected with jewelry. By comparison with it some of the little manuals of the arts and crafts that involve use of precious or semi-precious stones seem thin and amateurish.

The extent, indeed, of the investigations which the authors have undertaken "in their spare moments" is surprising. They say in their introduction that for many years they "have collected data on the subject of pearls and have accumulated all the obtainable literature, not only the easily procurable books, but likewise manuscripts, copies of rare volumes, original edicts, and legislative enactments, thousands of newspaper clippings, and interesting collections of data in existence on this particular subject." Nor have they worked without collaborators. A formidable list of persons who have rendered assistance starts with the names of Queen Margherita of Italy, the Gaekwar of

Baroda, and H. R. H. Prince Ruprecht of Bavaria.

As a natural result of their study the writers are wholesomely skeptical about many of the cherished stories regarding the pearl. Cleopatra, it seems, did not dissolve a gem worth sixty million sestertii in vinegar:

> Even with boiling vinegar it requires several hours to extract the animal matter from one four or five grains in weight, the acid penetrating to the interior very slowly.

Pearl divers, like Ibn Batuta's man of 1336, who, according to apparently veracious testimony, could stay under water from one to two hours, must, it is understood, have been differently constituted from the hardy fellows of the present day about the reefs of the Persian Gulf or the Straits of Ceylon, for whom ninety seconds is a long period of submergence. The book also carries its warning against impostors. Almost innumerable projects for artificial cultivation of pearls have been promoted since the announcement by the Swedish naturalist Linnæus in 1761, that he "possessed the art" of impregnating mussels for pearl production, and that he would sell his "secret" for a suitable reward. We are told, however, that, although "there is scientific basis for the belief that it may be possible in time to bring about pearl growth in this manner [through parasites], the public should not be too hasty in financing companies soliciting capital for establishing so-called 'pearl farms.'"

Judiciously but unmistakably the authors favor the side of the pearl as against the diamond, which, since the opening of the Brazilian mines in 1727, has been a successful competitor for public favor. The superior qualities of the pearl are its beauty unspoiled by cutting and faceting, and its harmony with practically all materials which have decorative value. When the sudden prosperity which followed the civil war resulted in a widespread demand for gems, particularly showy ones, the diamond naturally came to its own:

> So popular did that gem become that many a young man invested his first earnings in a "brilliant," and an enormous diamond in the shirt front became the caricatured emblem of a prosperous hotel clerk.

Of late years, however, the pearl has acquired in this country a new vogue which this sumptuous volume will certainly help to increase.

Inscriptions of the Nile Monuments: A book of reference for tourists. By Garrett Chatfield Pier. Pp. xx+357. New York: G. P. Putnam's Sons. $5 net.

The author has undertaken a huge task, one that cannot be performed within such narrow limits. The motive which lies behind the venture is to be found in the fact that Egypt is becoming more and more a place of winter residence to which thousands of people resort, people who are ill-prepared to comprehend the wonders which are spread before their eyes. Among these persons are a few who are distinctly interested in the significance of the monuments and who wish to know what they mean and what the message of the nieroglyphic texts may be. When one has wandered through the Cairo Museum and has visited site after site, one begins to realize how numerous such texts are, and, though many are mere bombast and high-flown titles of royal persons, how impossible a feat it must be to give any adequate idea of them as a whole. That would require a *corpus*, not a small volume. All that is feasible is a selection; and as a selection implies judgment of values, estimates of a given performance like that of Mr. Pier must vary.

Within the limits of his volume the author has made a judicious, though restricted choice, and he has prefaced each translation with an account of the monument and of the history of which it is a part. His translations are made from the original hieroglyphic text, and are independent in character. Occasionally he has done violence to English construction by following very closely the Egyptian order of words; at times, however, this method adds to the picturesqueness of the versions. In some cases a photograph accompanies the text, so clear that the hieroglyphics can be read even without a glass. Here the reader would have an added sense of reality if the contents of each line might be identified.

The book is well illustrated with halftones, chosen with judgment and adequate knowledge. The type, however, is needlessly large for a tourist's use, and the paper of a thick, glazed sort which makes the book inordinately heavy to carry. For home study, after one's return, it is all that could be desired. The edition is limited to 350 copies. Printed on thinner paper and in smaller type, some of the 130 illustrations might suffer, but the book would gain, and it would certainly prove not only a practicable, but an interesting and a profitable companion on a Nile voyage and on a temple pilgrimage.

Science.

The Eruption of Pelée: A Summary and Discussion of the Phenomena and Their Sequels. By Angelo Heilprin. Printed for the Geographical Society of Philadelphia, by J. B. Lippincott Co.

Both man of science and layman are as yet deplorably uninstructed concerning the deeper significance of volcanos and earthquakes. Slowly geological science is working back to some systematic study of these subjects, but progress has been erratic. The science began with superstition and catastrophism, progressed through the work of Hutton, William Smith, Lyell, and Darwin to a recognition of evolution by means of processes like those in operation to-day, and then made a leap to deductive interpretation of past history on the basis of guesswork which is without parallel in the other systematic sciences. The word "guesswork" is harsh, but there is much geological theorizing for which no other name is suitable. We live on the crust of this globe, and its heavings, its outgivings, and its intakings are vital to human occupancy. How vital may be seen by glancing at the recent records of Jamaica, San Francisco, Vesuvius, Santa Maria in Guatemala, Valparaiso, Martinique, and St. Vincent—all since the beginning of the twentieth century. And yet at none of these places, all known to be liable to disaster, were there observatories or experiment stations in any way adequately equipped to make records of the phenomena before, during, and after the catastrophe. We have spent millions on the stars, and are spending other millions on the atmosphere through the meteorological offices. Astronomy and meteorology have become types of relatively exact sciences. We are closer to the earth's body than to the heavens; but as yet we have barely commenced to study it. A beginning has been made through the maintenance of seismographs casually at various places, but very few observatories exist exclusively for seismometric measurements. The only permanent volcano stations in the world are on Vesuvius and Etna, though there are four hundred and fifteen recorded active volcanos. Until money is abundantly supplied for endowment of earth exploration and earth observatories, whereby measurements and quantitative data may be secured, geology will continue to be an inexact and narrow historical science.

The destruction of St. Pierre in 1902 resulted in the appointment of numerous scientific missions for the study of the volcano Pelée, and its neighbor Soufrière. Notable among the geological missionaries was the late Prof. Angelo Heilprin of the Philadelphia Academy of Sciences and Yale University. His new book, which was in type at the time of his death in July, 1907, summarizes his two earlier books, "Mont Pelée and the Tragedy of Martinique" and "The Tower of Pelée." It also presents the results of the observations made in Professor Heilprin's fourth and last visit to Martinique, in February, 1906, "when it was found practicable to descend into the crater of Pelée and examine the fragments of

the tower, an investigation which confirmed Professor Heilprin in the theory, previously put forward, that the giant obelisk was the ancient core of the volcano. The sequels of the great eruption of Pelée—the remarkable afterglows and other atmospheric phenomena visible in all parts of the globe—are described in the light of the most recent scientific observations and reports. In the concluding chapter the author sets forth his views regarding the inter-relationship of volcanic and seismic disturbances." The volume contains seventy-one pages of text and forty-three half-tone plates from photographs, many of which are of extraordinary interest. It is to be regretted that there are no maps, no references in the text to the plates, and no alphabetical subject-index.

Professor Heilprin's life-work as an explorer and popular expounder of geological truths was fitly crowned by the discoveries which he made in Martinique. His style is lucid and at the same time full of vivid dramatic touches. He rarely sacrifices scientific precision for the sake of popular effects, but his scientific convictions seem sometimes tinctured with an innate love of the marvellous. For example, on the basis of the ash-content and cubical capacity of the steam-cloud, he estimated that Mont Pelée discharged 11,520,000,000 cubic feet of solid sediment per day, more than that carried forth by all the rivers of the world in the same time:

> Mont Pelée was in a condition of violent and almost continuous activity for upwards of two hundred days; can we assume that during this time it may have thrown out a mass of material whose cubical contents were hardly less than a quarter of the volume of Martinique as the island appears above the water?

This estimate is vitiated by the assumption of continuous activity for so long a period and by neglect of the fact that the waters of the crater were probably for long periods producing effects of pseudo-eruption by working over materials which fell back and were thrown up again and again. There certainly were, however, great volumes of ejected matter, and perhaps Heilprin's estimates may serve a useful purpose in stimulating future observers to find, if possible, a better basis of calculation. His method has at least the merit of being an attempt at quantitative work. But with all allowance for the author's personal enthusiasms, the volume remains essentially scientific in tone. Footnotes and text abound with references to the work of other investigators, and Professor Heilprin's scholarship and familiarity with books, in various languages, are nowhere shown to better advantage.

One of the important parts of his book is the discussion of the obelisk, a gigantic shaft of rock which rose a thousand feet above the new dome of lava and boulders, that filled and finally overtopped the crater. This obelisk was the famous "Tower," ragged on one side, smooth on the other, and fluctuating in height. It finally crumbled to a mere stump in the summer of 1903. Heilprin maintained that the obelisk "was merely an ancient core of the volcano that had been forced from the position of rest in which solidification had left it." The view more commonly accepted by geologists is that of Lacroix, to the effect that the vast block was the solidified top of a stiff viscous lava rising vertically. A separate chapter is devoted to the blast which, like a fiery tornado, destroyed Saint Pierre and in a few minutes annihilated 26,000 people. In his earlier writings Professor Heilprin had expressed the belief that heavy carbon gases, such as carbon dioxide, were largely responsible for the loss of life. From this position he now recedes and concludes, in accordance with the well-established opinion of geologists, that super-heated steam charged with hot ashes and lapilli, forced through the lower lip of the crater that was directed toward Saint Pierre, was the destroying agent.

The final chapter is a brief but suggestive statement of the author's conclusion that a broad inter-relationship exists between volcanic and seismic phenomena, a relationship evidenced by sympathetic and synchronous phenomena in places as much as two thousand miles apart. These phenomena are great earthquakes, on the one hand, and volcanic outbreaks on the other. Thus the eruptions of Soufrière and Pelée in May, 1902, were heralded by the destructive earthquake in April at Quetzaltenango, Guatemala, at the opposite end of the Caribbean Sea. In the same twelvemonth volcanoes awoke to activity and earthquakes occurred all around the Central American region. Professor Heilprin points out that the earthquakes of the last half-decade have each been accompanied by correlated volcanic eruptions; an earthquake in Calabria, 1905, followed by the violent eruptions of Vesuvius and Stromboli, 1906; San Francisco, 1906, was contemporaneous with the rise of Metcalf Cone at Bogoslof in the Aleutian Islands; Valparaiso, in the same year, with the outbreak of Chillán in Chile; and Kingston, Jamaica, with eruptions in Central America. The author does not commit himself to any opinion concerning cause and effect in contrasting tectonic and volcanic forces. He insists on acknowledging a regional relationship, and denies "the modern view of the general independence of the two classes of phenomena":

> Earthquake and volcanic disturbances seem to be the expression of one common interior telluric strain or condition, and this condition may in some or many cases be clearly associated with a pronounced magnetic or electro-magnetic quality of the planet.

In "Neurological and Mental Diagnosis" (The Macmillan Co.), L. Pierce Clark and A. Ross Diefendorf seek to give a brief outline of essentials suited to the need of the practitioner dealing with diseases of the nervous system or the mind. As a whole the presentation is good and helpful, being aided by the illustrations. Personally we should like to lay a little more stress on the importance of letting the patient tell his own story. The significance of disturbances of the sense of taste is not very clearly indicated. A narrative of psychiatric cases covering over fifty pages and a glossary spread over twenty-seven more seem to us to contain many superfluities.

"Hygiene for Nurses," by Isabel McIsaac (The Macmillan Co.), is a very comprehensive book for its size (208 pages), and covers too much ground. In large part it is made up of quotations from good authorities rather skilfully put together, but not always quite fully understood by the author. Much of the information is good, but there is far more of it than the average nurse may be expected to comprehend; nor will she be able to use many of the directions unless she already knows too much to need the book. To give but one illustration, an inexperienced person will certainly have trouble if she try to disinfect a room with formaldehyde according to the advice in the eleventh chapter.

The Société Française de Physique publishes in one volume "Œuvres de Pierre Curie," xxii, 621 pages, 118 figures, 3 plates (Gauthiers-Villars).

Alfred Ditte, the distinguished French chemist, professor in the Faculty of Sciences at Paris, has died at the age of sixty-five. His best known work is the "Traité élémentaire d'analyse qualitative des matières minérales," published in 1879.

Drama.

A New Variorum Edition of Shakespeare. The Tragedy of Richard the Third with the Landing of Earle Richmond and the Battle at Bosworth Field. Edited by Horace Howard Furness, jr. Pp. 641. Philadelphia: J. B. Lippincott & Co. $4 net.

It is now some forty years since the publication by Dr. Horace Howard Furness of the first volume of his monumental "New Variorum." Amply and nobly planned, this great work has gone on steadily from year to year until sixteen stately volumes attest an industry, a devotion, and a self-abnegation rare even among the sacrifices to scholarship. Dr. Furness picked somewhat and chose, as was his right, among the thirty-seven plays commonly accepted as Shakespeare's, trying his prentice hand on "Romeo and Juliet," with its pretty problem of the two quartos, proceeding to "Macbeth," and thence to the master problem of "Hamlet." Since the volumes "Lear" and "Othello," publish-

ed, respectively, in 1880 and 1886, the comedies have most attracted Dr. Furness, though his own latest volume, "Antony and Cleopatra," returns all but to complete the cycle of the greater tragedies. It is obvious to any one in the least acquainted with the mass of Shakespeare criticism, emendation, and conjecture that the attempt of any one man, however strong his heart and complete his equipment, to grasp this chaos of detail must end, considering the shortness of human life, far this side of completeness. Moreover, Malone and Boswell, in the Variorum of 1823, coped with critics and commentators in tens; the modern editor of a variorum must cope with hundreds. Even as these volumes appear, new material appears with them. It is a happy promise for the continuance of the "New Variorum" that Dr. Furness has found in his son so able a coadjutor. Mr. Furness made his bow to the public as an editor of Shakespeare in his revision of "Macbeth," the second volume of his father's undertaking. He now comes forward independently with "Richard the Third."

The editing of this play presents no easy task. As the chief enemy of the victorious house of Lancaster, the figure of Richard was one of the most popular on the Elizabethan stage. Tradition had transformed the real Richard into a monster, hunched of back and depraved in nature, and the playwrights of the day vied with one another in heightening the picture. Among the dozen plays or more in which Richard figures, Shakespeare's is nearly the last. Acknowledge though we must the dramatist's immediate source in the Hall's "Chronicle" (which is reprinted as to the parts concerned by Mr. Furness, after the general plan of the "Variorum"), Shakespeare must also have had before him not only the popular images of the hunchback king, but the figure as he had already become conventionalized on the stage of the time.

But it is not the sources of Shakespeare's "Richard the Third" that trouble the critics, whatever their minor differences of opinion on this score. The popularity of the subject and of the Shakespearean tragedy in particular caused this play to appear in a larger number of quartos than any other drama of the entire age. Thus the problem of the variorum editor involves at the outset a comparison of the texts not only of the four folios, but also of eight quartos. And even though some of these editions are merely reprints, and hence little to be regarded, the difficulties of the texts that remain are extreme; for the divergencies are far greater than in the case of almost any other play of Shakespeare, and additions and amplifications complicate the subject still farther. To state the main problem briefly—the first quarto of 1597 contains verbal differences, amounting occasionally to whole passages, not found in the folio, but necessary to a clear understanding of the context. On the other hand, the folio contains nearly two hundred lines, some of them constituting passages of considerable length, not found in any quarto, and yet to a large degree necessary to the sense. The Cambridge editors supposed "the quarto to represent Shakespeare's original work; the folio, a copy revised and augmented by him, but again revised by some unknown hand, with occasional aid from quarto three"; and Spedding, accepting this relation, believed "the folio an incomplete revision and augmentation of the quarto by Shakespeare himself." In opposition to this view, Delius, Pickersgill, and Daniel—the last in his introduction to the facsimile edition of the first quarto of "Richard the Third"—regard the folio as the original work; Delius believes the quarto a copy clandestinely obtained and piratically printed; Pickersgill suggests that it was a shortened actors' copy of the folio; and Delius lays stress on its shortening by way of revision at the hands, as he believes, of the author himself. It is a pretty little quarrel, and it indicates the almost insuperable difficulties besetting an editor who would form a composite text, "either by his own personal preferences or by the consensus of opinion of his predecessors."

A collation of the folio and the quartos of 1597, 1602, and 1622, with Mr. Furness's text, in a scene taken at random, shows that he has upheld to the full the high standard for accuracy set by the earlier volumes of the "New Variorum." We could wish that this accuracy had extended to the transcriptions of the title pages of the quartos on pp. 431 and 432. We read on the title of the quarto of 1597, "Paules Churchyard," not "Churchyard"; on that of 1602, "*Acted*" not "*acted*"; and on that of 1622, 'are to be sold by *Mathew Law*, dwelling / In *Pauls* Church-yard, at the Signe of the *Foxe*, neere / S. *Austines*-gate, 1622," and not "at the Signe / of the *Foxe* neare S. *Austins gate*, 1622." These are trivial matters elsewhere than in the precise transcription of an old title in an authoritative work. If there are variants, even so slight as these in the titles of various examples of the self-same quartos of Shakespeare—a possible explanation of these discrepancies—they ought to be recorded. If, as was surely to be expected, so excessively rare an edition as the quarto of 1622 was not accessible to the editor, he might at least have transcribed the title from the photographic facsimile by Praetorius—a book readily accessible to all—rather than have depended, as he says, on even such excellent authority as the Cambridge editors. It is fair to Mr. Furness, however, to add that in the vast mass of material that he has handled few such errors in printing appear.

Following the plan of the previous volumes, the older "True Tragedy of Richard the Third" is printed entire from the quarto of 1594. This crude but vigorous old play may have affected Shakespeare but little; yet it is worthy of preservation among the earlier chronicle histories of the age. The collected criticism of the tragedy, English, German, and other, is culled with a sure hand and condensed, where there is need, with skill; and the editor contributes a couple of informing pages on the stage history of the play. It seems hardly fair that Hazlitt's caustic and unfair criticism of Colley Cibber's acting version should remain the last word on the subject, when as a matter of fact, whatever he did to the poetry, Cibber really produced a more effective stage play. "Between 1700 and 1821," as we are informed, "Cibber's version was the only form in which the play was acted." Macready in the latter year dared not leave out all of the familiar lines—of Cibber, not Shakespeare—that had held the stage so long; and as recently as 1889, and in our own country, the late Richard Mansfield retained several of Cibber's interpolations.

One topic this work touches not. Neither the word "authorship" nor the word "Marlowe" finds a place in the index, which is sufficiently full. But perhaps this silence is justified. Marlovian though this tragedy certainly is, we need not attribute this characteristic to any closer touch with the elder poet than we might expect from the admiration and the conscious imitation of the young ambitious Shakespeare. In "Richard the Third," Shakespeare had not yet come into his own. Would it be too bold to suggest that these admirable volumes of the "New Variorum" might prove even more valuable, could they offer a complete bibliography of each play in its appropriate volume? The list of books is both helpful and suggestive, but we should have them all, even the discarded material and the tyro's endeavors in a work such as this deserve at least a record.

"The Actors' Birthday Book," of which a second edition has just heen puhlished hy Moffat, Yard & Co., gives a biographical sketch of an actor, or actress, or of somebody closely connected with the theatre, for every day of the year. The selection is made, apparently, with reference to convenience only, not merit, and the certificates of ability attached to the portraits are entirely worthless, but the names of plays in which the various performers appeared, with dates of production, make the book useful for reference.

John Valentine's comedy, "The Stronger Sex," now to be seen in Weher's Theatre in this city, is scarcely likely to duplicate, under existing conditions, the success which it achieved in London. Dramatically considered, it is not a valuahle work, heing

conventional in theme, and unskilful in construction. But the characters, although modelled after old types, are differentiated with some ability, while the dialogue—in the second act, at any rate—is of better quality than is commonly encountered in the modern society drama. The tale is of a great heiress, an apparently timid, gentle, loving creature, who, finding that her husband has married her for money only, suddenly reveals the iron hand beneath the velvet glove, and conquers his affection by proving her superiority. This, of course, is the reverse of "The Taming of the Shrew," and if Miss Annie Russell is not entirely well suited in the part of the dominating wife, she, at least, makes her an attractive and pleasing figure. The piece is elaborately staged and fairly well acted.

The first performance of Mimi Aguglia and her much-talked-of Sicilian players, in the Broadway Theatre, on Monday night, scarcely justified the exuberant praise lavished upon them by many European critics. They are competent performers, such as we have been in the habit of expecting from Italy—where the stock company system and severe but wholesome competition still survive—but by no means extraordinary as representatives of their country. Nevertheless, they may be accepted as able interpreters of peasant life. Their whole behavior upon the stage is suggestive of verisimilitude, and the naturalness, vivacity, and intelligence with which they play into each other's hands are altogether admirable. But judging from their first representation, that of the "Malia" of Signor Capuana, which is said to be their best piece, the quality of drama which they offer is not high. "Malia," or "Witchcraft," is a sordid little tragedy, in which, Jana, a peasant girl, crazy for the love of her sister's husband, Cola, is thought to be bewitched. Finally, she so infuriates her own betrothed, Ninu, that he cuts Cola's throat to free her from the supposed spell. The piece contains two sensational scenes, the first in which Jana reveals her passion to Cola, and the second, that of the assassination, and these alone have much interest for an English speaking audience. In the confession episode, Mimi Aguglia gives an extraordinary and highly unpleasant exhibition of reckless passion, complicated with epilepsy. It is upon this manifestation, which is purely physical—mere bodily contortions, that could be duplicated, possibly improved upon, by any vigorous adult—that her reputation as a realistic actress of genius is mainly founded. But there is nothing in the least suggestive of either art or genius. It is altogether too lawless for the one and too coarse for the other. It passes comprehension how comparisons could ever have been made between such crude sensationalism and the reasoned work of artists like Bernhardt, or Duse. It might be argued that a Sicilian peasant would exhibit the fury of a woman scorned in some such way. The answer is that the demonstration is not suited to the public stage.

The "suffragette" excitement in London is beginning to have its reflections in the theatre. "The Builders" is the name of a play, by Nora Keith, which has just been tried at a special matinée, and is said to exhibit dramatic ability. In it the domestic and the political woman are antagonistic figures.

Dispatches from Paris report that Victorien Sardou, before his death, had practically completed the manuscript of a revolutionary drama styled "L'Insaisissable," written for production in the United States and England.

Music.

Piano Playing. By Josef Hofmann. New York: The McClure Co. $.75 net.

It is related of the late Pablo Sarasate that shortly before his death he began to write a treatise on violin playing, but after completing a few pages tore them to pieces, and said: "What's the use? Those things are for word-artists, not for us." Apparently, that was also Chopin's conviction, for he, too, began to write a book on his art, but after the first few pages abandoned it. Liszt followed his example, though he was also a "word-artist." But now, at last, there exists a book on piano playing by a first-class pianist. With the exception of Paderewski, Josef Hofmann has no superior to-day, and every pianist will, therefore, be interested in reading what he has to say on his art. The first page, to be sure, acts like a damper pedal, for Mr. Hofmann declares that he intends to deal with the material side of piano-playing only, the psychic side eluding treatment in literary form. In truth, however, his book contains many hints that throw light on the psychic, imaginative side of playing, too.

Perhaps the most interesting chapter is the one entitled, "How Rubinstein Taught Me to Play." Rubinstein taught for some years in the Imperial Conservatory at St. Petersburg, but accepted only one private pupil, and that pupil was Hofmann, who was sixteen when he came, and eighteen when he left. Unlike Liszt, Rubinstein never played for his pupil, because he wanted to develop individuality. He allowed great freedom in the matter of interpretation of a piece, saying once: "In fine weather you may play it as you did, but when it rains, play it differently." Unlike Liszt, again, Rubinstein never allowed the pupil to bring one of the teacher's own works to the lesson-room. For this singular attitude he never gave a reason, and he carried it to the logical extreme of not going over his own D minor concerto with his pupil, when the latter was about to make his début with it at Hamburg. Rubinstein was much pleased with that début, but after that refused to give any more lessons, and when the lad, in despair, asked why, Rubinstein answered: "My dear boy, I have told you all I know about legitimate piano-playing, and music-making, and if you don't know it *yet*, why, go to the devil."

Pianists will find useful information on such diverse matters as dynamics, playing with feeling, the difficulty of pleasing critics, memorizing, posture at the piano (illustrated by photographs of the author), reading books on music, playing in style, etc. The author warns against the use of the metronome, because "the keeping of absolutely strict time is thoroughly unmusical and dead-like." Of particular value are his pages on the use of the pedal. While pointing out that "piano charm" is to the greatest extent produced by an artistic use of the pedal, he declares that the pianist has to "treat the pedal differently in almost every hall to insure the same results." He himself has found the pedal an important medium of rectifying the acoustic misbehavior of a hall. Inasmuch as most concert halls misbehave acoustically, other pianists may find here a suggestion worth considering.

The Public Library of Boston has one of the best collections of vocal and instrumental music and books on music in the country. There is a general musical department, comprising about 11,000 scores, pieces, and books, most of which are for home circulation. In addition to these the library has the Allan A. Brown collection, the volumes of which cannot be taken out. When this collection was given to the library, in 1894, it included 6,990 volumes; to these Mr. Brown has made yearly additions, and the present number is 10,800. Of this Brown collection the trustees have undertaken to print a special catalogue. So far two parts of Vol. I have appeared; the first comprises the entries to Boosey; the second, to Concertos. The parts are for sale at $1 each, and it is needless to say that such a catalogue is useful, not only to those who can go to the library, but to many others who may desire information regarding scores and books. While the lists are not intended to be complete, they are in some cases fuller than those in musical dictionaries and combination catalogues of publishers. Under Bizet, for instance, we find mention of seven books on him, and under Berlioz no fewer than seventeen. There is much, too, that has chiefly an antiquarian interest, such as the twelve columns of titles of songs and pieces by Abt, most of which are as dead as last autumn's forest leaves.

Romain Rolland, lecturer at the Sorbonne and historian and critic of music, continues the story of "Jean-Christophe," into whose life and musical development he evidently endeavors to put all his own conclusions as to the contemporary evolution of music. Each volume may be read separately as a complete romance. The first four volumes brought up his hero, from the dawn of musical talent, in Germany. Then came an episode—the arrival at Paris. The new volume, "La Foire sur la place," introduces us to the varied musical world of Paris, to society and salons, to musicians, artists, and men and women of letters, and even to politicians—all as if they were seen by a Beethoven of to-day. In spite of the unusual form of his utterances, no one can deny the competence of Professor Rolland

and the intellectual significance of his writings; their spirit may be described as satire, without indulgence. The next volume of bis "Jean-Christopbe à Paris" is to bring us to the true France, distinct as every one knows from cosmopolitan Paris, which is without interior—only a façade.

Lionel Dauriac, with tbat versatility which distinguishes the gravest French philosophers, turns from his arid theses to treat a question of musical psychology, in the order of time of production of the works of "Le Musicien-Poète Richard Wagner." This philosophical study is followed by a systematic bibliography, particularly complete in French works (Fischbacher).

In pursuance of the new policy of producing operatic noveltles, Eugen D'Albert's "Tiefland" had its first American performance on Monday night at the Metropolitan Opera House, with a remarkably strong cast, including Destinn, Scbmedes, Feinhals, Hinckley, Goritz, and Reiss. Such a cast no German city could duplicate—far from it—yet it is not likely that the opera will become so popular here, as it is in Germany, where it is tbe most pronounced success since Humperdinck's "Hänsel und Gretel" (1893). Like the most popular works of the Young Italians, such as "Cavalleria Rusticana," "Tosca," "I Pagliacci," it is based on a play which had previously proved its power of drawing large audiences witbout music; but more than any of these, it depends on the intelligibility of the text, and this it is impossible to secure in the vast auditorium of the Metropolitan even were all the hearers familiar with German. Tbus it happened that although all the artists named are good actors, a great part of the opera bored tbe audience; yet nearly everybody remained to tbe end, where tbe strong scene of tbe rescue of Marta by ber husband from the clutches of Sebastiano atoned for much. Musically, "Tiefland" is not a masterwork. D'Albert has all the technical skill needed for a successful opera; he has melodic ideas, too (a rare thing to-day), though they are generally trivial. But he writes too much. If he put the musical contents of tbree of his operas into one, he might write scores of lasting value.

Tbe exclusive rigbts to present in America Richard Strauss's opera "Electra" have been acquired by Oscar Hammerstein for tbe Manhattan Opera House. The work will be first sung in January in Dresden.

Art.

The Life of James McNeill Whistler. By E. R. and J. Pennell. Illustrated. 2 vols. Philadelphia: J. B. Lippincott Co. $10 net.

The quarrels and the law-suits which were so conspicuous a part of the public life of Whistler have continued beyond his death, and what was to have been a life and letters has had to appear without the letters which would have been so interesting a part of the work. From their hero himself, however, and from many other sources, the official biographers have obtained much information not hitherto accessible to the public; and, in spite of the absent letters, these well-written, handsomely printed, and lavishly illustrated volumes do afford such new light on the art and the character of Whistler, together with a great deal of entertainment, as will render them welcome to a large public.

Apart from their almost necessary attitude as biographers, the extreme admiration of Mr. and Mrs. Pennell for the art of Whistler is well known. They look upon him as, by odds, the greatest master of the nineteenth century, and as one of the very great masters of all time. One is prepared for some extreme of praise, and is more surprised at the occasional admission of spots upon the sun, than at the celebration of its effulgence. Still, one may sometimes take exception to the particular form of praise indulged in. Like most serious artists, Whistler was pretty well aware of his own weaknesses, though, naturally enough, he did not often mention them in public; and his celebrated letter to Fantin, in which he regretted his lack of education and expressed the wish that he had studied with Ingres, was written in a rare moment of sincere self-revulsion. Our authors call it "an absurd piece of modesty," maintaining that "he drew better than Ingres, as his etchings prove." Now, with this unqualified statement it is impossible to agree. It is, of course, true that Whistler could draw after his fashion. He had a fine sensitiveness to the quality of lines and an ability to find his way among the multiplicity of details of the docks and shipping of the Thames that is little less than marvellous; but a serious draughtsman of the figure he never was. In a moment of candor the authors admit that he frequently had difficulty with the hands of his figures, and that "some of his later pictures were unfinished because he could not get the hands right." They name, however, the Little White Girl, the Symphony in White No. 3, and the Sarasate as three pictures which prove that he could paint hands. The Sarasate certainly comes nearer to affording such proof than either of the others, and in it the hands are very fairly satisfactory—by far the best Whistler ever did. The Little White Girl has one gracefully indicated hand, that resting on the mantelpiece; the other is thin and structureless—more like paper than like flesh and bone—and not especially beautiful even in outline. In the Symphony in White the girl to the right has hands which are pretty, if not over-solid; the other has really no hands at all. And it is to this condition that Whistler's figures frequently come. But, if he could hardly draw a hand, still less could Whistler draw a leg or a foot. The legs of the Irving as Philip II are grotesque; those of the Connie Gilchrist are stuffed stockings; and in the host of little nude figures that he etched or sketched in pastel there is hardly one in which the extremities are more than indicated with the utmost slightness. It is even worse when that test of draughtsmanship, the drawing of the figure beneath drapery or costume, is attempted. The figures in the Symphony in White, lovely as are their lines, have really no bodies at all; and it might be said of many of Whistler's male figures, as a recent writer has said of the Théodore Duret, that they are "supported on trousers." We may be sure that Whistler knew what he meant when he complained of his lack of training in drawing; and it was not for nothing that the famous Six Projects, exquisite in color and in line, remained always in the state of projects, and were shown, again and again, almost to the end of his life, as sketches of pictures he was about to paint.

There was another cause for the artist's reluctance to attempt the carrying out of these projects, as, indeed, for the growing tendency to slightness and to the avoidance of large canvases, or of problems of even so much complexity as that involved in the portraits of his mother and of Carlyle. The light which this book throws upon the chronology of Whistler's work, makes it clearer than ever that almost all of it which attained to what is generally recognized as completeness, or which deals with any complication of subject matter, was produced before his fortieth year. Even the full-length portraits become rarer after this time, and those that are produced have seldom any accessories, or even any definite background, while more and more of them were left unfinished. The nocturnes and the marines continue nearly to the end; there is a host of delicate pastels, and water-colors; his oil paintings, in so far as they deal with humanity, tend more and more to be restricted to the single head. The Pennells will not hear of George Moore's explanation that there was some lack of physical vitality in Whistler during these years, and they seem to show that his technical ideal was more to blame than any failure of his powers. This ideal demanded that the whole work, whatever its size or complication, should be painted over from top to bottom at each sitting. The task was almost impossible of accomplishment in a full length portrait, even when all accessories were omitted; it was altogether impossible in such compositions of several figures as The Projects. If such pictures were to be painted at all, it must be by other methods.

It was these limitations of training and technique, perhaps, more than any principle, that led Whistler to find the material for his "arrangements" in the world about him, and to foreswear *ja-*

ponaiseries and classic costume. The truth is he was never, in the strict sense, either draughtsman or painter, but pure decorator—an arranger of harmonies, to whom it mattered nothing where the material he used might come from, so long as the harmony was attained. That he might have been something more than this, there are many evidences, but the deficiency of his education stood in his way. He very intelligently recognized his weaknesses and his limitations, created a system of art, which should neutralize them, or change them into virtues, and then proclaimed this system to the world—perhaps with conviction, certainly with effectiveness—as the only right one, founded on immutable laws. Just now, in the inevitable reaction from impressionism, his is one of the most potent influences, and it is as natural that he should be overrated to-day, as that he should have been misunderstood in the beginning. His present exaggerated vogue will probably decline, but his united surfaces, his subtleties of tone and fine discrimination of color, his elegance of pattern, and infallible tact in the division of space, must be permanently delightful to all those who are sensitive to the refinements of art.

There are one or two minor matters in regard to Whistler's art about which a word or two may be said before passing on to a consideration of his personality. One of these is the evidence here offered that his actual method of painting was less his own than we have generally imagined. It is made clear that his careful mixture of tones upon the palette, painting the picture there, as it were, before transferring it to the canvas, was taught by Gleyre to all his pupils, as, indeed, it was afterwards taught by his successor, Gérôme. Even Whistler's use of black as a "universal harmonizer"—which in the hands of unintelligent imitators bids fair, for the moment, to extinguish modern painting in universal sootiness—seems to have been derived, also, from his first master, Gleyre, who startled his pupils, one day, by saying: "Le noir d'ivoire est la base des tons." The other notable characteristic of Whistler's method, in all but those early works which show the influence of Courbet—the thinness and extreme liquidity of the pigment employed—seems to have been dependent upon his sense of propriety in the use of materials. He conceived of oil painting as the art of laying broad, smooth surfaces of color, as one would paint a door, and he came more and more to detest not only the loading of Rembrandt and the impressionistic "division of tones," but even the presence of any visible brush-marks. A point of less, though of some, general interest is brought out by the statement that Courbet's visit to Trouville, in 1865—a souvenir of which is to be found in Mrs. Gardner's little Whistler, Courbet on the Beach—was for the purpose of taking "his first look at the sea." If this is true, it follows that the influence of Courbet which every one has seen in The Coast of Brittany and The Blue Wave could not have been the influence of Courbet's marines, which were not yet in existence. Under the general influence of Courbet, Whistler was painting these sea pieces somewhat as his master was to paint them later.

But the world at large is vastly more interested in personalities than in pictures; and the personality of Whistler was so sensationally notorious that it is likely more people will read this book for what they can find about the author of the butterfly letters than will study it for the understanding of the painter of nocturnes. As in duty bound, his biographers make out as good a case for their hero as possible. They find it easy to show that there was a pleasant side to the man, and that many friends at all periods of his life found him amiable as well as entertaining. They would fain prove that he was not quarrelsome, and that in all his quarrels he was in the right. They will not allow that his witty gibes were the result either of exasperated nerves or of mortified vanity, but maintain that he did everything deliberately and for a purpose. Sometimes, they tell us, this purpose was a vindication of the dignity of art or of the rights of artists; but the gist of the matter is in the statement:

> He captured the press, . . . he concentrated the interest of England, of the whole world, upon him, with one object in view—that is, to make England, to make the whole world, look at his work.

Waiving the question whether such methods are compatible with that dignity of art of which Whistler was so zealous an advocate, one may inquire with some pertinence: Did his advertising pay? The cost of it must have been great, and the time and energy he spent in making himself talked of must have been taken from his legitimate work. What was the result? It is our conviction that his notoriety as a wit and an eccentric considerably delayed his recognition as a serious artist. The world was so used to think of him as a jester that it took his pictures, also, as "Mr. Whistler's little jokes." It expected to be amused by his art as by his conversation, and laughed as a matter of course, even when it saw nothing amusing. The habit was not easily outgrown.

When fame did come, however, it was given a peculiar brilliancy by its strange mixture with notoriety. Every one had heard of "Jimmy Whistler," and when, at last, it was discovered that he was a great artist, every one heard that, too. His reputation became more widespread than could be any reputation based alone upon artistic achievement. Whether the dazzling conspicuity of a few years compensated for the contempt of many, must have been a question of temperament. For him, probably, it did. In the future—let us hope it will not be too long delayed—everything but his delicate talent will cease to matter, and he will be judged by his work alone. His art was neither robust nor profound, but for a certain exquisiteness, unique in its kind, it is likely to be immortal.

Jacques Reich of this city publishes an etching of Gen. U. S. Grant made from a photograph taken some time between 1869 and 1871. The photograph is in the possession of Gen. Frederick D. Grant, and a facsimile note from him on the margin of the etching states that he regards it "as a most excellent likeness." It is a finer and handsomer face than is commonly associated with Grant's name. The etching measures 14¼ by 11 inches, and is well suited for framing.

H. M. Cauldwell Company adds to its series of little books on the great art galleries "The Glasgow Gallery." In this the minimum of text disappears entirely, except for a few words of description beneath the plates. The selection of works for illustration is announced to be that of James Paton, the general superintendent of the gallery, and is made on less popular principles than in others of the series. We are given interesting examples of Botticelli, Giorgione, Titian, Rembrandt, Rubens, and others among the old masters; of Constable, Corot, Millet, De Camps, Daubigny among the moderns; two interesting Dutch or Flemish works, attributed to Van der Goes and Maluse; besides Whistler's Carlyle, and a number of other works by English and Scotch painters of to-day and of yesterday. On the whole, a better impression is conveyed of a collection rich in real works of art than in previous volumes.

W. H. Chesson's "George Cruikshank" in the Popular Library of Art (E. P. Dutton & Co.) is as far below former numbers of this excellent series as is its hero below Rembrandt, Leonardo, or Holbein. It seems hardly possible that any one but a collector should care very much to-day for the elaborate, humorless caricature and the finikin detail of Cruikshank, but any who are interested will wish for a more straightforward and less affected book.

In three volumes containing more than one thousand pages K. W. Hiersemann, Leipzig, has just issued "Das Glas in Altertum," by Dr. Anton Kisa, with an appendix by Dr. Oskar Almgren, on discoveries of ancient glass in Scandinavia. The work contains 395 illustrations and 19 tables.

The popular history of art, "Die Meister der Malerei und ihre Werke: Fünf Jahrhunderte Malkunst in Deutschland, Italien, Spanien, Frankreich, England, und den Niederlanden," edited by Max Rooses, director of the Museum Plantin-Moretus in Antwerp, has now been completed by the publication of Part xii. The letter-press is excellent, and the 423 reproductions of pictures, 13 in colors, do credit to the publication house of Wilhelm Weicher. Leipzig.

"Matériaux pour servir à l'histoire de la

dentelle en Belgique" (Brussels: Lamertin) is a great publication, beginning with a first series of five examples of precious church laces; one of Brussels of 1599; the laces of Notre Dame de la Paix at St. Nicholas's Church, Brussels; an alb of Tervueren; the Virgin's mantilla (*faille*) at Notre Dame de la Chapelle, Brussels—these four described by Eugène Van Overloop; the fifth, by M. G. Des Marez, is devoted to the historic laces of Notre Dame des Sept-Douleurs at the church of the Riches-Claires, Brussels. The five fascicles, each paged and titled separately for convenience of classification, are accompanied by a folio album of twenty plates.

"La Bijouterie française au XIXe siècle (1800-1900)," by Henri Vever, appears in two volumes: I (1800-1850), Consulate, Empire, Restoration, Louis Philippe; II (1850-1900) Second Empire, Third Republic. The first has 1,250 engravings in and out of text (120 francs); the second 835 engravings (80 francs—H. Floury).

The Royal Commission on Welsh Monuments has already begun its sittings. It is intended to do for Wales much what the recently appointed Scotch Commission has to do for Scotland. As expressed in the Royal Warrant its object is "to make an inventory of the Ancient and Historical Monuments and Constructions connected with, or illustrative of, the contemporary culture, civilisation, and conditions of life of the people in Wales and Monmouthshire from the earliest times, and to specify those which are most worthy of preservation." The scheme of work set forth in the opening address of the chairman (Sir John Rhŷs) includes: (a) The drawing up of preliminary lists of monuments based on the ordnance and tithe-farm maps, to be amplified and corrected by means of information obtained from the various archæological societies, from district authorities, teachers in primary and secondary schools, and others possessed of local knowledge; (b) The collecting and reviewing of extant literature bearing on the monuments; (c) The inspection of the various monuments, first by the Secretary Edward Owen, afterwards for the settlement of disputed points by others of the commissioners.

The opening up of Morocco promises to be profitable to the history of Roman art. The scientific mission sent out by the French government has already done good work by methodical excavations in a necropolis which was discovered while running a boulevard through the new quarter of Tangiers. One of the tombs, which had already been rifled in ancient times, had two of its sides decorated by paintings which are still in a good state of preservation. In one of them a red and green bird is framed in by straight wreaths and then by a double garland of volutes. In another a fresco fragment shows a Roman holding a whip between two horses. There are other very curious paintings of a leopard and a peacock; and two inscriptions have been secured. One of the tombs, although plundered in ancient times, still contained many articles of interest to archæologists of the present day.

The Archæological Commission of Italy has, according to the press dispatches, received from Prof. de Pedra a report that the excavations of Herculaneum do not promise important results, and that work should be continued at Pompeii. The commission has acquiesced in these conclusions and has recommended that they be carried out.

The *Giornale d' Italia* publishes additional details of the exposition to be held in Rome in 1911. Besides an international exhibition of modern art, which will be opened in the Museum of Fine Arts on the Via Nazionale, there will be one devoted especially to architecture, in which designs for modern dwelling-houses will be prominent. Two competitions with suitable prizes will be opened. One, international, is intended to afford an opportunity for comparing the ideals of a private house and its adaptation to the various demands of modern life and social conditions. It will include the construction of a series of large houses, wholly decorated and furnished, and so arranged as to show the advance domestic architecture has made during the last thirty years. The other, a national competition, will be directed especially to present conditions in Rome, and due regard will be paid to the climate and to the needs and habits of the people. It is proposed to select three typical designs and build a house suitable for the rich, another adapted to a family of average means, and a third for workingmen. It is also planned to exhibit reproductions of the most important buildings constructed during the past half-century for different forms of public service.

The *Giornale d'Italia* is authority for the statement that almost at the same time and independently, King Victor Emanuel and Pius the Tenth have ordered the publication of works upon the great collections of medals in the Quirinal and the Vatican. The "Corpus nummorum italicorum" authorized by the King will be a history of Italian mediæval mints and coins, and will contain 600 copper plates, reproducing 12,000 designs. The "Collezione Vaticana" will include the plates of the Papal bulls and the complete set of pontifical coins and medals. It will be illustrated with 200 plates, containing 4,000 figures. These works will be published within two years. Of even greater importance to students of numismatics is the movement initiated by Prof. Serafina Ricci of Milan and endorsed by the Italian Society for the Progress of Science to secure the adoption of a uniform system of arranging the collections of coins in Italian museums and of providing instruction on this subject in the universities.

Paintings by Joseph Lindon Smith will be exhibited at the Pratt Institute, Brooklyn, till December 5. Among the shows at the dealers' galleries in this city are paintings and etchings by Miss Mildred E. Walker, Powell's, till November 28; portraits by W. G. von Glehn, Knoedler's, November 28; mezzotints by Samuel Cousins, Joseph B. Pratt's, November 30; and sculpture and water-colors by A. Phimister Proctor, Montross's, December 5.

Miss Imogene Robinson Morrell, once well-known as a portrait painter, died November 22 at Washington. She was born in Attleboro, Mass., and began her art studies in Newark, N. J. Later she studied in New York; then in Düsseldorf under Schrödter and Camphausen, and in Paris under Français and Couture. For the last ten years of her life she remained in seclusion, and died in poverty. She painted a number of celebrated persons, including Gen. John A. Dix, Howell Cobb, Mrs. Cleveland, Collis P. Huntington, President Garfield, and W. W. Corcoran. Her portrait of Dix hangs in the Senate wing of the Capitol.

Finance.

THE "BULL MARKET" IN WALL STREET.

The wildly excited speculation for the rise which has prevailed on the New York Stock Exchange, since election, is a phenomenon of peculiar interest. During the present year, "million-share days" have been rarities; in no single month of the year have transactions run beyond 21,000,000 shares; and September's total was 17,500,000, or far below a "million-share" daily average. In the fifteen days between November 3 and Saturday of last week, 19,000,000 shares were dealt in, as against 6,500,000 in the fifteen days before election.

This is not all. We have had periods of Stock Exchange excitement, such as that of August, 1906, when enormously wealthy capitalists provided the whole motive power, using their own money and money borrowed from the American and European banks. But the motive power of the present "bull movement" has distinctly been what is known on Wall Street as the outside public. These are not necessarily real investors, who purchase to hold, as they did in 1897 and 1898; the buying orders chiefly reflect a sudden speculative frenzy on the part of a multitude of people of varying wealth, who have rushed in to buy stocks "on a margin." After November 3, their orders came to commission brokers in such quantity as actually to strain the physical facilities for doing business.

By the middle of last week, after a fortnight of almost uninterrupted advances, the inevitable decline began. In the next two or three days, Union Pacific shares, which had risen 10 points since election, fell back 5; United States Steel stock, which had advanced 10½, fell 4; Amalgamated Copper, having gone up 8, went down 6; and so on. Nevertheless, there was no such overwhelming reaction as might have been expected after so extravagant a movement, and this week a sharp recovery ensued. Whether the decline is to be resumed or not, the "bull market" itself remains a phenomenon to be explained. This was not, as in 1901, for instance, a case where European operators and our own great capitalists lost their heads, along with the general public, and plunged with them into rash speculation. Financial Europe has stood severely aloof this month; it feels poor, and is avowedly distrustful of our mar-

ket. Our own powerful capitalists did indeed expect an "after-election boom" in stocks; but they looked immediately for a violent rise of a few days only, on which they could take their profits by quick selling; and the proof of this attitude is that the strong "insiders" did sell in great quantities, during the two days after election. If further and more explicit proof were needed, it might be found in a well-authenticated statement, ascribed to E. H. Harriman and given to one of his Western colleagues in the "bull movements" of the recent past, to the effect that "the state of the Stock Exchange is unfortunate; the movement has gone beyond safe bounds; the pace has been too fast"; and that "professional speculators, together with the outside crowd, have made the situation on 'Change dangerous."

Taking it as it stands, however, this remarkable outburst of extensive speculation for the rise, on the part of the general public, may mean any one of several things. In this case, it undoubtedly signifies, first, that the public at large is far from the poverty-stricken condition which it occupied, or thought it occupied, twelve months after the panic of 1893. It also means that remembrance of the after-election markets of 1904 and 1900 has imbued the popular mind with the conviction that a victory for the candidate favored by financial interests necessarily means a great advance in prices. That was certainly the sequence of events on the occasions referred to; and though the reasoning from effect to cause was crude, the *post hoc* argument was none the less alluring, especially when, after November 3, half the newspapers of the country filled their columns with the most extravagant assertions about the returning "boom in trade." So much for the psychological origin of the "outside public's" demonstration.

When one comes down to facts, it may be said with confidence enough that the country is nearer to a normal basis of good times in trade and industry than it was a month ago. Distinct improvement in business is an admitted certainty; the doubt is as to how far the improvement may go at the present time. Careful observers at such points as Pittsburgh and Chicago, declare that, even with the "after-election boom," the volume of trade is still only 65 to 75 per cent. of normal. People of intelligence and experience insist that this uncertainty, whatever they may wish about it, has not yet been removed. As a rule, these people are not saying much; because, when the multitude insists that a "boom is on" in trade again, he who doubts or denies, is unpopular. The man that the mass of flighty people like is the man who tells them that, a month from now, we shall be hustling along with the roaring trade of 1906, and that, six months later, we shall be in a state of industrial activity never before conceived of in our wildest dreams. Those newspapers, whose ear is forever to the ground, have naturally been giving out exactly that information, and giving it in full measure. Only in a few quarters does one encounter such calm review of the situation as that of the conservative *Iron Age*, which described the newspaper "prosperity articles" as "a general hurrah of exaggeration and misstatement," and it is not such responsible trade organs which the speculative public reads.

The effect we see. On a larger scale, it is the Sunshine League again; indeed, current assurances as to what has already happened in trade and industry, or as to what will infallibly happen to-morrow, are in reality no less glowing than those with which we were favored last July and March. The difference is, first, that with the progress of gradual recuperation, the realities are considerably more favorable than they were, four and seven months ago; second, that accumulation of orders, through postponement in the month before election, gives an actual volume of activity greater than then existed; third, that the public's imagination has been fired by repeated talk about the potent influence on the whole economic future of the country, which a vote for President was bound to exert. Wall Street's speculation may mean nothing more than this, or it may mean a good deal more. The public is gambling on the question. That it will suffer for its recklessness, whatever the outcome in the field of general industry, there is not the slightest doubt.

BOOKS OF THE WEEK.

Ashe, Samuel A'Court. History of North Carolina. Vol. I. Greensboro, N. C.: Charles L. Van Noppen. $5.

Beach, Edward L. An Annapolis Youngster. Philadelphia: Penn Publishing Co.

Bennett, Virginia. Old Farm Story Box: Pigeon Tale; Windmill Tale; Fieldmouse Tale; Duck Tale. Dutton.

Benson, Irene Elliott. The Yellow Princess. McLoughlin Brothers.

W. A. LOCY'S
BIOLOGY AND ITS MAKERS
By the Professor of Biology in Northwestern University. 123 illustrations. 8vo. $2.75 net.
"Entertainingly written, and, better than any other existing single work in any language, gives the layman a clear idea of the scope and development of the broad science of biology."—The Dial.

C. W. COLBY'S
Canadian Types of the Old Regime
By the Professor of History in M'Gill University. Illustrated. $2.75 net.
The author has brought the French writers to bear on the English, and vice versa, as no one else has attempted to do. It is written by a Canadian who understands the attitude of the French Canadians toward their own past.
"A light and graceful style. Not only interesting reading, but gives as clear a notion of what the old régime was at its best as may be found anywhere in a single volume."—Literary Digest.

OSCAR KUHNS'S
THE SENSE OF THE INFINITE
This book traces the evidence of the transcendental element in the literature and religion of the Western World, from the time of Plato to the present. $1.50 net.
"Mr. Kuhns has successfully pinioned this almost intangible and extremely elusive subject and brought it within reach of the average understanding. His masterly marshaling of the immortals of literature is not the least of the merits of this sincere and most readable book, which is characterized by breadth of view and clearness of thought."—Chicago Evening Post.

R. S. HOLLAND'S
THE BUILDERS OF UNITED ITALY
Alfieri, Manzoni, Gioberti, Manin, Mazzini, Cavour, Garibaldi, and Victor Emanuel. With portraits. $2.00 net.
"Popular, but not flimsy. The general reader can hardly fail to be so stimulated that he will go to seek a wider acquaintance with this fascinating period. . . . A pleasant talent for narration."—The Nation.

RENE BAZIN'S
THE ITALIANS OF TO-DAY
By the author of "The Nun," etc. Translated by William Marchant. $1.25 net.
"A most readable book. He touches upon everything."—Boston Transcript.

HENRY HOLT & CO. 34 W. 33d St. New York

COLUMBIA STUDIES IN HISTORY, ECONOMICS AND PUBLIC LAW
NEW VOLUMES

Volume XXX. **THE PROVINCE OF NEW JERSEY. 1664-1738.**
By EDWIN P. TANNER, Ph.D., Sometime Fellow in American History, Columbia University; Instructor in History in Syracuse University. 8vo. Pp. XVI—712. Paper covers, $4.00, or in cloth $4.50.

Volume XXXII. **THE ENFORCEMENT OF THE STATUTES OF LABOURERS.**
During the First Decade after the Black Death, 1349-1359. By BERTHA HAVEN PUTNAM, Ph.D., Instructor in History at Mount Holyoke College. 8vo. Pp. xii-224 with Appendix (480 pages) of Documents, Lists and Tables. Paper covers $4.00; in cloth $4.50.

LONGMANS, GREEN, & CO., 93 5th Ave., New York

Now ready
Blackstick Papers
By LADY RITCHIE
8vo, with 3 Portraits. $1.75 net
A collection of essays by Lady Ritchie, a daughter of Thackeray—dealing with men and books and other matters, written with the grace and charm which characterized her famous father's Roundabout Papers.
CONTENTS: Introduction.—Fellcia Felix.—St. Andrews.—Joseph Joachim.—Egeria in Brighton.—Nohant in 1874.—Links with the Past.—Mary and Agnes Berry.—Paris.—Prisms and Primitifs.—"Jacob Omnium."—Mrs. Gaskell.—Tourguenieff.—Thomas Bewick.
G. P. PUTNAM'S SONS, NEW YORK and LONDON

OUR LIBRARY SERVICE
We have recently supplemented our service to Libraries, by procuring Out-of-Print and Scarce Books, and by importing English books.
Our Educational Catalogue contains a full list of Supplementary Reading, indicating the grade to which each title is adapted.
Our Clearance Catalogue contains overstock at special prices, and an alphabetical arrangement by authors of all cheap editions of Recent Popular Fiction and Standard Library 12mos in one list.
Our Library Catalogue of 3,500 approved titles, following A. L. A. lines, is of great convenience to small libraries.
Our Monthly Bulletin notices promptly every new book of importance.
These Catalogues are sent on request.
Three notable features of our service are: Promptness, thoroughness, and low prices.
THE BAKER & TAYLOR CO.

AUTOGRAPH LETTERS of Celebrities Bought and Sold. Send for price lists. WALTER R. BENJAMIN, 225 Fifth Ave., New York City. Pub. "THE COLLECTOR," $1 a yr.

The Nation.

NEW YORK, THURSDAY, DECEMBER 3, 1908.

The Week.

To the agreement between our government and Japan's no objection has been raised in this country, save one of a technical nature. Senatorial prerogative and jealousy are ruffled by the intimation that the document is not to be submitted to the Senate. For the Democratic minority of the Foreign Affairs Committee, Senator Bacon asserts that any agreement of the kind, without the approval of the Senate stamped upon it, is "not worth the paper upon which it is written." This criticism of the mere form of the negotiation does not seem vital or even very important. The agreement does not purport to be a treaty. If it were, and if it undertook to bind this country to Japan in an offensive and defensive alliance, even of the limited kind seen in the Anglo-Japanese treaty, it would have to be submitted to the Senate; but nothing of that ambitious and revolutionary sort has been attempted by Mr. Root. He has made to Japan a declaration, as it were, of the present policy of our State Department in certain matters of common interest. Either country could ignore it and go to war; but, then, treaties do not prevent nations from making war if they are bent upon it. Unless there is a sound motive and an honorable purpose behind a treaty or an agreement, neither is worth much. And if the agreement entered into with Japan does really express the common mind of the two countries, as regards the matters covered, and if there is an intention on both sides loyally to abide by it, then the technical objection amounts to little. The status of the negotiation is much like that of Secretary Hay's concerning the Open Door in China. In that, too, there was no question of a treaty or an alliance; but an exchange of notes proved of the greatest value.

Secretary Root's undertaking is of narrower scope, but deals with a situation even more critical. That our relations with Japan have been strained for three years past, it is useless to deny. In both nations a state of mind has existed which has predisposed men to exaggerate trifles, and dwell too much upon points of friction. It was to this kind of lurking apprehension and mental inflammation that Mr. Root addressed himself; and it seems to us that the solution hit upon will be of immediate practical effect, and of lasting value as an example of peaceful adjustment of difficulties. The instrument agreed upon rests on a basis of mutual respect. Japan disclaims any designs upon our territorial possessions, as we upon hers. This at once disposes of the Japanese "swoop" upon Hawaii, or the Philippines. In China and Manchuria, where trade interests are common, the agreement guards each side; and in case anything arises to disturb conditions in the Orient, the two governments agree to "consult" with each other, and to act in common, if a way be found to do so. In short, the agreement emphasizes the stake which both Japan and the United States have in the maintenance of peace, points out the many ways in which they can coöperate, and adds written and official pledges which are as binding as good morals and the national conscience, no more and no less. The way in which this achievement has been hailed abroad as a great work for peace, is a good measure of its importance. Foreign commentators know that if either party to it were to violate the contract, no court exists to inflict punishment, except the court of international public opinion. But the impalpable writs of that court are gaining in respect with every year. International goodwill is an asset which the richest nation cannot throw away; and a repute for honor among sister-nations is a thing which the mightiest will not to-day disregard. It is upon these simple principles that the agreement with Japan is founded.

At last, it appears, there is to be a radical overhauling of the Navy Department, undertaken by Secretary Newberry. The necessity of a reorganization has been felt by every recent Secretary who has been in office long enough to master his duties. So long ago as 1885 President Cleveland, in his annual message, used the following emphatic language:

> I deem it my duty to especially direct the attention of Congress to the close of the report of the Secretary of the Navy [Whitney], in which the humiliating weakness of the present organization of his department is exhibited, and the startling abuses and waste of its present methods are exposed. The conviction is forced upon us with the certainty of mathematical demonstration that before we proceed further in the restoration of the navy, we need a thoroughly organized Navy Department.

But Mr. Whitney's appeals were in vain; he, too, had to content himself with the shifting of duties between the bureaus. Nor did it avail him to recall to the memory of Congressmen that ten years previously, in the investigation of the Navy Department of 1875-76, an able officer, Commander D. McW. Fairfax, had informed the House Naval Committee that "the bureau system was gradually undermining the discipline of the Navy Department, and must sooner or later be changed." Secretary Herbert, in 1894, dwelt on the incessant friction between the bureaus, all coördinate. Secretary Long, after his experience in the war with Spain, also urged strongly that the department should be reconstituted. It was during his administration, we believe, that the captain of a battleship received orders from one bureau to sail from the New York Navy Yard at once and was threatened with court-martial by another if he did so. Mr. Long, in 1899, declared that the bureaus of steam engineering, construction, and equipment should be consolidated, since all their functions related to the preparing of a ship for sea, and in 1900 he repeated this recommendation. The facts, then, are indisputable. The strange thing is that the abuses have persisted through so many administrations.

The decision of the Supreme Court, in the matter of the two-cent-fare law of Virginia, is important, both in itself and in its implications. We may be sure, for example, that the corporations in this State, which are thinking of testing the constitutionality of the Public-Service Commission law, will instruct their counsel to read, mark, and inwardly digest this decision, before proceeding. The Virginia Commission is not,

indeed, on all fours with the New York body. The former is a creation of the new State Constitution; the latter of the Legislature. The functions of the two are, however, in many respects similar. Both are empowered to fix rates. To do that was alleged by the Virginia railways, as by opponents of our Public Service Commission, to be a judicial act; and judicial powers cannot be delegated. But the Supreme Court has now decided that it is a legislative act. This does not mean that it is final, or cannot be inquired into by the courts. If its effect, in a given case, is confiscatory, its enforcement can be enjoined. But the act itself is not judicial. This being so held for Virginia, would surely be so held for New York also. By so much, therefore, the probability that our statute would be upheld by the Supreme Court as valid, is heightened by the decision.

The prevailing opinion of the court goes a long way towards clearing up a dubious and disputed province of law—what may be called the twilight zone which lies between the State courts and the Federal courts. It will be remembered that efforts have been made in several States to prevent cases arising under railway-regulation laws from being taken before Federal judges. In some instances, severe penalties have been proposed for even attempting such a course. On this question of the fundamental right of appeal the opinion of the court, as read by Mr. Justice Holmes is very explicit:

> A State cannot tie up a citizen of another State, having property within its territory, invaded by unusual acts of its own officers, to suits for redress in its own courts.

So that is ended. At the same time, the Supreme Court is desirous, in practice, of showing all deference to the State courts. The gist of the decision is to send back the whole case for trial before the Virginia Court of Appeals. The railways should have exhausted their recourse for justice in the State before resorting to the Federal courts. Said Judge Holmes:

> The State had endeavored to impose the highest safeguards possible upon the exercise of the great power given to the Corporation Commission by providing for appeals to its highest courts. It was only a just recognition of the solicitude with which the rights of the railroads had been guarded that they should make sure that the State, in its final action, would not respect what they thought their rights to be, before resorting to the Federal courts. If the rate should be affirmed by the Court of Appeals, and the railroads should still regard it as confiscatory, they would be at liberty to renew their application to a Federal court.

This seems to be common sense, and it lays down a general rule which the Supreme Court may be expected to follow. It should do much to allay any feeling which may have been growing up that the Federal courts are too prone to ignore or over-ride the State courts. On the other hand, State Legislatures will doubtless be slower, after this decision, to boast that they have made their laws "injunction-proof."

If Mr. Taft's choice of Mr. Hitchcock as his Postmaster-General is open to any censure, it is because Mr. Hitchcock was the campaign manager. In consequence, the appointment may appear to some as a payment for that labor. It must, however, be admitted that if Mr. Hitchcock had remained First Assistant Postmaster-General, his promotion would be hailed as particularly desirable. For Mr. Hitchcock, like Mr. Cortelyou, has worked his way up through the government service. Hence his appointment to the Cabinet should be another stimulus to the great body of civil servants in Washington. None the less, there should be more sensitiveness in regard to the practice of rewarding political managers with high office. Of course, a President must form his estimate of a man, in part at least, on the basis of services to the party. Had Mr. Hughes, for instance, not been reëlected Governor of New York, Mr. Taft would have done well to consider him for a Cabinet position because the Governor's great assistance during the campaign was a demonstration of capacity that should be enlisted in leadership. To obtain high office by intellectual contributions to party success is an historic and eminently proper way of advancing one's self. Since we cannot train our Cabinet ministers in Congress, after the good English fashion, it is especially legitimate to qualify as adviser to the President by proving one's fitness on the stump or in the party councils. It is when we come to the purely executive side of party management that drawing the line between the fit and the unfit is difficult. Critics will be moved largely by the effect of the example set by selecting Mr. Hitchcock, rather than by any objection to his promotion. They will doubtless ask whether it will not induce the mob already asking for minor offices to believe that the smaller places are also to go to men "who had their coats off during the campaign."

Fortunately, we have made great progress since the days when only a few "doctrinaires" denied that the spoils belong to the victors. The civil service bars now guard our Presidents from that shocking rush for jobs, which, in Mr. Garfield's case, led to assassination. Rewards are less frequently given for mere machine work; and the publication of campaign contributions will make it more difficult, hereafter, to assign an office to a man merely because of his cash payment to the National Committee. For Mr. Hitchcock's case there is, of course, abundant precedent. Mr. Roosevelt early rewarded Hanna's right-hand man, Henry C. Payne of Wisconsin, by making him Postmaster-General. Mr. Cortelyou was already in the Cabinet when he managed Mr. Roosevelt's campaign of 1904, but his transfer to the Postmaster-Generalship came soon thereafter. Indeed, this office, with its enormous patronage, is by custom specially reserved for valiant party laborers, one reason, perhaps, why the postal service has never been more successful as a business enterprise. Justice to President Roosevelt demands, however, a recognition of the fact that in his distribution of Cabinet offices he has been much less guided by a desire to reward party workers or campaign contributors than by his wish to recognize the various elements in our cosmopolitan electorate. It has meant far more to him to give representation to our Jewish and Catholic fellow-citizens, and to have a genuine Southern Democrat at his Cabinet table. Whether Mr. Taft will be guided by similar motives remains to be seen. The promotion of Gifford Pinchot, who has been such an admirable Chief Forester, would meet with hearty approval. Anything that makes for efficiency, both in the Cabinet itself and out of it, will be acclaimed; and the oftener a man is appointed because of peculiar fitness, the more disreputable it will seem to put a man into the Cabinet merely for the money he has paid or the votes he can swing.

Some of the advocates of protection show a curious obtuseness in regard to taking a personal interest in laws which will affect their own pockets. Mr. Dingley was a woollen manufacturer, but found no impropriety in working for increased duties on the product of his mills. Yet this was much as if a member of a city council or a head of department should have an interest in a contract upon which he himself was to pass officially. In principle, it comes pretty near the offence of Senator Burton of Kansas, who violated the statute forbidding members of Congress to act as attorneys for private clients before the government departments. But Representatives seem free to admit in the hearings by the Ways and Means Committee that they have a personal interest in certain tariff rates. Thus, when the lumber schedule was under discussion the other day, Congressman Joseph W. Fordney of Indiana remarked: "I have been in the lumber business ever since I was a boy." He also stated, alluding to lumber manufacturing: "I am in the manufacturing business in the South, in the State of Mississippi"; and again, referring to the lumber business on the Pacific Coast: "I am in the business out there." Even more striking was the case of ex-Congressman M. E. Rhodes of Missouri, who asked that the duty on barytes be increased from 75 cents to $5 a ton. He read from one of his own letters: "I have personal knowledge of the situation, because I am interested in the mining of barytes." He explained to the committee:

> When I was in Congress I introduced a bill in the Fifty-ninth Congress which sought to fix a specific duty of $5 a ton on crude ore, because I believed at that time that that would give us ample protection.

Thus protection appears to abrogate the maxim that a man shall not be judge in his own cause.

The process of "chloroforming Tim" is now complete. The Taft cottage at Hot Springs witnessed the last act of the tragedy—or is it a comedy? After a conference on Sunday Mr. Woodruff announced his withdrawal from the race for the Senatorship in favor of Secretary Root. Of course, Mr. Woodruff "profoundly appreciates the unanimity and earnestness" with which he has been "appealed to by the organization and the members of the Legislature" from his "home county of Kings," and the "cordial offers of support" which have come to him "from every section and almost every county of the State." But with that delicacy of sentiment which has marked his whole political career he feels that "the power of the State organization should not be used by the chairman of the State Committee to further the candidacy of any one person against another." Moreover, Mr. Taft wishes to have Mr. Root in the Senate, and therefore Mr. Woodruff magnanimously makes the Great Renunciation. Of course, this means that there will be no opposition to Mr. Root's election. The only ominous feature of the affair is Mr. Taft's statement that Mr. Woodruff "has established his claim to the gratitude of the Republicans of New York, and also of the country at large." This looks as if Mr. Woodruff's claim to something "equally good" were in some way to be recognized.

The decision of the Unionist Peers to kill the Licensing Bill in the House of Lords will intensify the difficulties of the Liberal Prime Minister. It had been plain for some time that the Lords would not accept the bill as it left the Commons, but it had been hoped that they would pass it with some amendments, especially as several bishops favored it as a temperance measure. The outright killing of the bill, therefore, raises once more the question whether Mr. Asquith will dissolve and appeal to the people, with a programme of radical reform of the Constitutional position of the Lords. Probably, the Premier will find it wisest to pocket this affront and wait until a break comes on some more vital question. The Lords have accepted worse bills—the Trade Disputes and Old-Age Pension Bills—without protest. They have thus laid themselves open to the charge that they rejected the Licensing Bill in order to favor "the trade," and to gain the popular support of those workingmen who want cheap beer.

When the Viceroy of India abandons his inspection trip and returns to Calcutta heavily guarded, when lieutenant-governors and district superintendents are being attacked by bomb-throwers, Englishmen must take the Hindu disaffection seriously. The relatively small number of violent outbursts, news of which has leaked out through the dispatches, is still large enough to prove the strength of the new Nationalist movement among the natives. Japan's sudden rise has taught its lesson quickly, as everybody but a few civil service officials expected. And the Indian government must deal with the Nationalists, not as a pack of fanatics or murderers, but as a political party having a popular cause. English newspapers in India and at home are already conceding the wisdom of a policy of concession and conciliation. It may be, as the Calcutta *Englishman* holds, quite impossible for the British to give India a Constitution at once; there may be too many dishonest natives in power for that. But a progressive scheme of reform yielding steady increase of political knowledge, privilege, and influence to the governed is feasible—and ordained by the great awakening of the East.

All the evidence indicates that the unpopularity of the German Emperor still continues. It was thought that his yielding to the Chancellor and the Reichstag, with public opinion so strongly behind them, would be greeted with a burst of joy and renewed loyalty. In fact, however, his act seems to have been received with a certain relief, it is true, but with little enthusiasm. The talk is still of a great constitutional crisis. One cause of this persistent coldness towards the Kaiser undoubtedly is that he made his concession appear both ambiguous and grudging. When a sovereign has to surrender, the wise thing is for him to do it heartily and completely. William II might have learned something from Elizabeth of England. When she and her Ministers fell into a controversy with the House of Commons and the nation, over the question of monopolies, the Queen knew how to retreat gracefully. Macaulay wrote:

> There seemed for a moment to be some danger that the long and glorious reign of Elizabeth would have a shameful and disastrous end. She, however, with admirable judgment and temper declined the contest, put herself at the head of the reforming party, redressed the grievance, thanked the Commons, in touching and dignified language, for their tender care of the general weal, brought back to herself the hearts of the people, and left to her successors a memorable example of the way in which it behooves a ruler to deal with public movements which he has not the means of resisting.

DANGERS OF MAJORITIES.

It is no surprise to find Gov. Hughes the same man after election that he was before. He has accustomed us to that; and his speech to the Republican Club of this city last week contained his familiar doctrine. To serve the whole State; to make fitness the sole test for appointments to office; to advocate measures which are sound, whether they are immediately popular or not; and to do the thing that is right, whether it be considered politic or otherwise—such is the programme which this just and tenacious man marks out for himself and his party. One incidental sentence of the Governor's contains a good deal of political philosophy:

> Our chief danger lies in the fact that we have been given such a strong endorsement that we may forget the promises we have made.

It takes a cool and balanced head to see peril in a great political success, and to fear that the very disorganization of the other party may be a snare to your own. This idea found a spokesman in the recent conference in London about methods of electoral reform. A deputation waited upon the Prime Minister to ask that an inquiry be made into minority representation and other plans, before drafting a bill. In the course of the discussion, Lord Hugh Cecil declared that the great majorities of the last few years had been a misfortune to both parties and to the country. He referred impartially to the large preponderance of his own party in the last House of Commons, and to the immense majority of the Liberals in the present. In both cases, he maintained, the majority in representation did not really indicate so great a set of public opinion. The result was that party leaders were tempted to be careless and vainglorious, too indifferent about needed legislation, and unduly confident of the strength of their position, even when on the eve of defeat. This view is borne out by political experience in our country as well as in England. It is wise counsel which Gov. Hughes gives his party. Mr. Taft, too, is plainly of the same mind—namely, that it is well to rejoice in the sweeping victory at the polls, but that it is the part of wisdom to rejoice with fear and trembling Great majorities mean great responsibilities. Obstacles to be avoided or surmounted in an electoral campaign are often trifling compared with the difficulties of guiding the party aright after success is won.

The danger presents itself in two forms: first, as a temptation to be lazy; second, as an invitation to be reckless. It is easy for a party returned to power by a large majority to forget that its chief duty is not to enjoy the sweets of office. Pressure for appointment is the first thing that a new Governor or new President feels. It might seem to him as if the only aim of a popular uprising in an election was to find a place for Smith, and to vacate one for Jones. Gov. Hughes said that his desk at Albany was piled high with applications for office. But he took up the matter as one of the besetments of an executive with a victorious party behind him. It will never do for a party to say to itself that it has much spoils laid up for many years, and that all it has to do is to eat, drink, and be merry. By such a course it only points itself out as a fit subject for punishment by the voters—and elections often indicate the popular desire, not to approve of one party or the other, but to punish it.

The other danger which a great political majority brings with it is proneness to be extreme and overbearing. Moderation is one of the last lessons a certain order of politicians ever learns. Their instinct is to say, "What is a majority for except to be used for all it is worth?" Some measure born of party greed or personal selfishness is pressed forward. In an evenly balanced condition of parties, it could never be enacted, but a Prime Minister or a boss with a "fine brute majority" at his command, will see the chance to apply it, and will find it hard to resist. Yet true political leadership will always attempt to curb such impulses on the part of those who think themselves forever in control of government. This kind of political pride goeth before destruction. Party chiefs who think of a temporary or accidental majority merely as a means of furthering their own ends, and riding rough-shod over the other side, are simply preparing for themselves a day of judgment. When it comes, and they, in their turn, go down in electoral ruin, they will discover too late that they had used their large majority as a rope to hang their party with.

So well established is this frequently fatal nature of a majority, that it almost seems as if a law of party suicide were at work. Sea and land are compassed to secure a majority; yet the direct tendency of it appears to be to lead to a minority next time. The real task is, not only how to get a majority, but so to use it that it may be both kept and respected. That is the study to which party leaders should give their thoughts and vigils. It is evident that Gov. Hughes is at work on this great problem of political power; and we look forward to his recommendations to the Legislature as instruction in the way truly to utilize and safeguard a party majority.

THE SOCIALIST SHOWING.

The canvassing of the vote cast by the minor parties on election day has not been completed, but enough is at hand to show that Mr. Debs failed to come into his expected million by more than five hundred thousand votes. Socialists admit that the result of the election has been a disappointment, but refuse to call it a defeat. You cannot defeat a party which has so sure a mortgage on the future as all true Socialists believe they hold. Ever since Karl Marx demonstrated, to the satisfaction of those who subscribe to his theories, that the iron laws of evolution make the triumph of collectivism over the present economic system inevitable, his followers the world over have adopted the cheerful philosophy of looking upon every victory as a fulfilment of the Marxian prophecy, and every setback as only a postponement. Optimism naturally thrives on success, and there can be no denying that international Socialism has, in the very matter of its numerical growth, been successful to a degree calculated to turn the head of any high-spirited young party. With prosperity there may have come certain departures from the early rigidity of theory and practice. Socialist politicians, anxious to gain votes, have not disdained to make use of temporary or local issues. But in the end it is always the same great argument they fall back upon. "You can't beat us; we are bound to win in the long run because we have on our side the great law of evolution as summed up in our 'materialistic conception of history.'"

Why should the materialistic theory of history guarantee the success of Socialism? The reasoning is straightfor-

ward. Historical evolution is shaped, not by ideas, but by mechanical necessity. The moral ideals of society, its religious creeds, its political, legal, and social institutions, are all the outgrowth of economic conditions. This may be sneered at as a glorified sovereignty of the stomach, but there are your facts. In the long result, it is the producers who shape and rule society, and history is the story of conflict between a class of producers who would retain their control over society after their usefulness is gone, and a new class of producers struggling to come into its own. But it is evident that democracy has put power into the hands of the great mass of the world's workers. Hence these masses are ultimately bound to change society so as to assure their own welfare and domination. Q. E. D. The materialistic conception of history is the great Socialist weapon against the Philistines. To argue upon this or that temporary political issue, moral issue, or even economic issue, is waste of time, when you know that at bottom it is food, clothing, and shelter that rule the world. Injunction planks, monetary reforms, popular election of Senators, morality, patriotism, are all instruments of delusion. The materialistic theory of history teaches us that men in the last resort are swayed by the question of more food, more clothing, and more shelter. And in that game we Socialists hold the winning card.

But if the last election has proved anything, it ought to show the Marxians that their favorite weapon is one that cuts both ways. Bryan may hunt for explanations of what happened to him, and Debs may adduce this or that minor reason for the way he fared, but at bottom it is quite apparent that millions of workingmen and hundreds of thousands of business men who believed that Taft meant more food, clothing, and shelter than Bryan, voted for Taft. And if the Socialists need the consolation, we will grant it to them that many thousands who might have voted for Debs in prosperous times, refused to take a chance on Bryan's election when times were already pretty bad. Here, then, we have the materialistic theory and the economic man asserting themselves with a vengeance, but on the wrong side. If there is comfort in the thought that your pet theory has been shown to be correct, even if it is done at your own expense, that comfort is open to all good Socialists. If they assert that the workingmen who voted for Taft and more food will soon discover that the increased supply will not be forthcoming, the answer is that the discovery will come too late for the election of 1908, and will probably be forgotten before 1912. If Socialists were content to sit still and wait for the disillusioned workingman, after a half-century of disappointment, to cast himself into their arms, their confidence in the iron law of economic progress might, perhaps, be justified. But when they enter a specific political campaign on the issue of more food and shelter, in the future, they labor under the disadvantage of dealing with the ordinary man who prefers more food and shelter, in the present.

If the Socialist party really wishes for success at the polls, it will have to offer the voter something besides a distant, though perfect, social reconstruction based upon the materialistic conception of history. Wherever political Socialism has influenced public life, as in France, and to a less extent in England and Italy, it has been because of its readiness to deal with immediate issues of the day. Socialists must take sides on questions that can be solved from a socialistic standpoint without waiting for the establishment of the complete Socialist commonwealth. When they finally consent to deal with temporary issues, they may find out, too, that society is not so materialistic as the materialistic theory of history would have it, and that the economic man, on occasions at least, is something more than a consuming animal. They may find, for instance, that moral issues, patriotic issues, and even religious issues, are good for winning campaigns. Man has been known to give up food, shelter, and even life, for an idea. But he will rarely give up the nearer chance of food, shelter, and clothing, for a possibly greater amount of food, clothing, and shelter, far ahead.

THE HAPSBURG MONARCHY AND THE SLAVS.

Austria's annexation of Bosnia-Herzegovina has been explained as part of a new and aggressive policy. According to this theory, the virtual ruler of the Hapsburg realm is not the aged Francis Joseph, but his heir presumptive, Francis Ferdinand, to whom the main conduct of affairs has been delegated. Francis Ferdinand is a young man with ideals and a mind of his own; and among such ideals the principal one is said to be nothing less than the shifting of the Austro-Hungarian monarchy from its present double basis of German and Magyar equilibrium to a basis predominantly Slav. The future Emperor is credited with still wider aims. Once reorganized as a Slav power, Austria may make her way down into the Balkans, no longer a conqueror, but the natural ally and protector of the southernmost Slavs. And thus that historic goal of East European ambition, the open Ægean Sea, is reserved neither for Russia, whose eyes have been fixed on Constantinople for so many centuries, nor for the Pan-Germanists, who have been drawing a belt of Hohenzollern imperial rule from the Baltic, straight across Europe and over into Asia Minor, but for Austria-Hungary, which has seemingly been so concerned with her internal troubles as to have neither time nor inclination for visions of dazzling expansion.

This splendid Austrian hope, like most enthusiasms, has a certain justification in fact. The importance of the Slav element within the Austro-Hungarian dominions has been rapidly increasing. In numbers the Slavs grow faster than the Germans or the Magyars. In civilization they are overcoming the handicap which till now has given the control of affairs to the minority race both in Austria and in Hungary. The southern Slavs have still a long road to travel; agriculturists by nature and preference, they may never quite raise themselves to the intellectual level of the town-dwelling Germans and Magyars; but, after all, with the progress of democracy, numbers must begin to count more and more. In Austria universal suffrage has shattered the power of the Pan-Germanists. In Hungary the Magyar rulers are compelled by an extension of the franchise, grudging though the law is, to give a larger share in the government to the Slav races. The mere figures in themselves are impressive. In 1900, the forty-five millions of Hapsburg subjects comprised a little over eleven million Germans, less than nine million Magyars, perhaps three and a half millions of Romanic blood (Rumanians and Ladins), and

twenty-two million Slavs. In the Austrian half of the monarchy the Slav majority was especially large, fifteen and a half millions, as against nine million Germans and a million Rumanians and Ladins. The rate of increase since 1900 has been in favor of the non-Germans. In addition, Bosnia-Herzegovina has just added nearly 1,700,000 subjects of Slavic blood; so that at the present moment the Slavs have an absolute majority within the realm as a whole, and are in a majority of two to one in Austria.

The tradition of the Slav's unfitness for political rule is a waning one. Only ten years ago it was the German students who carried things with a high hand at the University of Prague. To-day it is the Czechs who victoriously rush the poor Germans. The Czech renaissance in Bohemia has been described by well-informed observers as one of the most amazing, if little-known, developments of European history during the last twenty-five years. German influences in Bohemia are carrying on a losing fight. The German language, and German science and art, are not being wiped out by a new sort of barbarian invasion, but effectively replaced by a Slav culture. The southern Slavs, while intellectually backward, have shown great power of resistance. In Croatia-Slavonia they have doggedly held their ground in face of the drastic methods of their Magyar rulers. Their passionate resistance to Austrian domination in Bosnia is historical. Indeed, the annexation of Bosnia has been described by apologists for Austria (for example, Dr. Emil Reich in the *Nineteenth Century* for November) as forced upon the latter by a gigantic Slav conspiracy for the overthrow of Hapsburg rule. The Bosnian press has been outspokenly seditious, and the Austrian censorship has coped with it in vain. In short, the Slavic peoples of Austria-Hungary have been proving very emphatically that they were not predestined from the beginning of time to be political hewers of wood and drawers of water for their German and Magyar brethren.

These are the facts which are supposed to have given rise to the new policy of Austro-Hungarian reconstruction. The dual realm is to be transformed into a federal realm. Report speaks of a new doctrine, "trialism," which would add to the present two members of the monarchy, a third in the shape of a Slav state formed out of the southern provinces of Austria. But though "trialism" is being widely talked about in Austria, it is hard to see how it can ever be put into practice. The great mass of Austrian Slavs is not in the south. Out of Austria's seventeen millions, over thirteen millions are in Bohemia, Poland, Silesia, and Moravia; and it is certain that Bohemia, which has long claimed an equal position with Austria and Hungary, would have to be satisfied bofore an autonomous Slav state in the South could be created. But whether there are to be three, four, or more equal federal members, federalism and growing Slav ascendency would seem to be questions of the near future in Austria.

MILTON AFTER THREE HUNDRED YEARS.

I.

Dryden, we know, sometimes visited Milton, in whose eyes the young guest was "a good rhymist, but no poet." It is not difficult to frame an image of such a visit. Milton, we may suppose, was then occupying the house in Bunhill Row, opposite the Artillery-ground, where he resided for the last twelve years of his life, left to decay in ignoble privacy by the contemptuous tolerance of the court. There the old man might be found, now blind and poor and served by his unwilling daughters, "in a small chamber, hung with rusty green, sitting in an elbow chair [in which he liked to lounge with leg thrown over the arm], and dressed neatly in black; pale, but not cadaverous, his hands and fingers gouty and with chalk-stones." On such evil times had fallen the author of "Comus" and "Lycidas," whom "patriotic piety," as he wrote in that last pathetic letter spelled out so painfully to an ignorant amanuensis, "had almost left without a country."

From this visit the mind travels to another at the end of the century. The young visitor has now himself grown old, and takes his ease in the famous chair by the fire in Will's Coffee-house. The world had not dealt altogether gently with him, but he had moved with the stream, always at the head though obeying its least impulse, and by industry and genius had made himself the recognized dictator in the new society of wits. About his comfortable seat stood the chiefs of that society as at a *petit coucher*, glad to hear his opinion on some poem or play of the hour, proud to take a pinch of snuff from the great man's box, while at a distance crowded the aspirants, awaiting their time and eager to catch some stray word from the inner circle. Enter the room a young boy, thin and sickly and with large straining eyes, brought thither by an older friend that he may at least in later days say *tantum vidi*. Those, in fact, were the regretful words used afterwards by Pope in his first published letter to Wycherley.

As a pendent to these scenes should be added the words of the weightiest critic of the following century. "Milton's republicanism was, I am afraid," says Dr. Johnson, "founded in an envious hatred of greatness. . . . He thought woman made only for obedience, and man only for rebellion." And as a writer he was "to be admired rather than imitated." The honor of acknowledged authority was reserved for Dryden who had himself learned to yield. "The new versification, as it was called, may be considered as owing its establishment to Dryden; from whose time it is apparent that English poetry has had no tendency to relapse to its former savageness." Dr. Johnson did not see far into the future, was even unaware of the force of the movements making for "relapse" in his own day; but when the change came, it went not back to Milton, but to his more lawless predecessors. His peculiar union of a free fancy with a disciplined form has never dominated English letters, and he has remained always in essential things alone and unapproachable.

There is a sad lesson in the contrast of those two scenes, a warning whose full magnitude is seen only as we look back over the record of the three centuries since Milton's birth. In the one are typified the isolation and weakness that waited upon the fretful revolt against what Milton himself called "the sour leaven of human traditions"; in the other, the arrogance and narrowness of a revengeful reaction. Both are a commentary on the limits and meaning of change. Many things in those days when the England of the Tudors was passing into that of the Stuarts cried out plainly for reform. The pity is that, instead of a skilled hand to revive and cultivate, there was let into that garden a horde of ruthless vandals. It is a small thing in itself that for a while the imagination was distrusted under the Puritan régime, that the theatres were closed, the picture collections of Charles dispersed or destroyed, the churches made barren of their beauty, the poets silenced or driven into obscure places. That the land was for a time, in the language of Strafford, "frequent in combustions, full of massacres, and the tragical ends of princes"—this is only one of the passing events of history. But it was a matter of serious import for the whole future of England that this complete break in tradition left the imagination in its hour of triumph a prey to all sorts of pernicious influ-

ences. When fire or commerce sweeps off the forest from one of our mountain sides, it is said that the trees have no power of resowing themselves; the land lies bare to wind and sun, and the lowland farms are deprived of their reservoir of fruitful waters. The trees may be replanted artificially by the hand of man, but too often the soil has been washed away, meanwhile, by exposure, and there is no assurance that ever such noble woods can be reared as when the original growth is trained and properly thinned. Something like that happened to English letters.

II.

When literature was restored with the Stuarts to London, it came back in a new guise, and, like the courtiers, in foreign dress. Unfortunately, it was in substance neither good English nor French. The form was borrowed from abroad, and the wit, but in character the heroic drama, to take the most conspicuous example, was removed by a whole world from the tragedy then flourishing in Paris. The forced aristocratic style and a certain air of unreality were transferred to the London stage, but the marvellous economy of art, the subtle penetration of human nature, the pure exaltation were for the most part exchanged for fury and fustian.

Nor was the old English spontaneity present to take the place of Racine's chastened idealism. It is a disagreeable fact that the excesses of the intervening prohibition left the door open for a revival of the worst, and only the worst, features of the Elizabethan drama. In their reaction from the passionate, if often misguided, morality of the Puritans, the new playwrights returned not only to the old lewdness, but to the barbarous lust for blood and horrors. The French banished even decorous death from the scene; but Dryden knew the temper of his audience when, in his "Amboyna," he showed the English merchants tortured by the Dutch, and in his "Indian Emperor" gloated over the execution of Montezuma.* And with this taste for the shambles, carried over from the Elizabethan stage and deprived even of its pretext of youthful extravagance, went the Marlovian defiance of egotism now a little absurd in the hearing of Charles's subservient court. The same contrast between form and substance runs through comedy and the other *genres* of the period. They were not merely immoral, but beneath all their laughter and polished wit, may be detected a vein of cynical indifference to suffering and at times a brutal cruelty. Those poets of the court, and one must add in his famous criticism, Charles Lamb also, forgot that a deliberate attempt to stimulate the animal passions is always destructive of the first purpose of art. The French may not have been less immoral than their imitators, but they had this instinctive sense of their craft. That first outbreak of the Restoration is not a savory chapter in the record of English letters.

*These illustrations are taken from Alexandre Beljame's "Le Public et les hommes de lettres." Students of English literature need not be told how thoroughly M. Beljame has worked out this whole subject.

III.

It is the teaching of a certain school of so-called scientific history that the changes of civilization are produced by large impersonal laws under whose sway individual men are as pawns in the game of fate. That theory is, perhaps, not quite so common now as it was a few years ago, and there would appear to be a reaction in favor of the directing influence of dominant minds. Certainly, if any great event can be attributed to the character of a few men, it was the crime of the seventeenth century in England, with all its attendant evils. In that month of spring in the year 1603 when James Stuart was riding south to take up his crown in London, a prophetic eye might have foreseen the troubles he and his sons were to cause. On the way the so-called Millenary Petition was presented to him by a band of moderate and conforming Puritans, who desired only a few unimportant changes in the service and prayer-book; one of the first acts of James at Hampton Court was to deny the Petition and to abuse the petitioners with a threat to "harry them out of the land." After that the history of England for two generations was a series of *ifs*, depending on the character of three or four men. Thus, if Prince Henry, with his objection to a Catholic marriage, had not imprudently chilled himself on the tennis court, and so left the throne to his brother Charles; if Charles at the beginning of his reign had not been bribed to accept the Petition of Right and so bound his hands; if Wentworth had been kept in England to raise a standing army, instead of being called back from Ireland when too late, and if Henrietta Maria, by meddling with the soldiers, had not brought him to the scaffold; if Charles had married a Protestant instead of a Bourbon princess; if he had chosen a wiser prelate than Laud; if he had not attempted to seize the five members of Parliament, or had planned the attempt more secretly; if the navy had not been wantonly alienated; if, in a word, James and Charles had not been at once so obstinate and so weak, they might either have succeeded in establishing, for a time at least, a monarchy like that raised in France on the ruin of the Fronde and the Reformation, or they might have guided their people through a bloodless and healthy revolution. But for the fanaticism of the king the opposing fanaticism of Pym and Lilburne and Cromwell would never have come to the top, crushing between them the moderate men who were the real strength, and, in the end, the salvation of England. For it is the very character of moderation that it should be helpless at first against the assaults of enthusiasm, and should come to its own, if at all, only after the frenzy of excess has exhausted itself. We shall never know the full tragedy of those moderate royalists, driven by harsh choice into the army, like Falkland, who threw away his life in order "that all might see that his impatiency for peace proceeded not from pusillanimity or fear to adventure his person"; or of those Puritans who felt to their friends in the other camp as Sir William Waller wrote to one on the eve of battle:

> My affections to you are so unchangeable that hostility itself cannot violate my friendship. We are both upon the stage, and we must act the parts assigned us in this tragedy. Let us do it in a way of honor and without personal animosities.

These were the men who bore the glorious tradition of the past—peace-loving gentlemen in the ranks, statesmen in the service of a blind king and a mad Parliament, poets and great preachers in hiding among the Welsh hills, subtle philosophers and divines like John Hales of Eton and the high-bred Platonists of Cambridge, whose voices were drowned by the shrill contending clamors, or who, more pitifully yet, felt the fires of hatred slowly kindling in their own breasts. These were the men, and not, as a modern historian says, the soldiers of Cromwell at Naseby, who might have "planted freedom in the deep, fruitful soil of antiquity." And they were the majority; it is undoubtedly true that, as Clarendon wrote, "the number of those who desired to sit still was greater than of those who desired to engage in either party." Their very desire for quiet growth, their "peace-ingeminating" spirit, prevented them from grasping rudely at the control of affairs; yet, so far as human reflection can discern, there was no reason why they should not have been led by wise authority to preserve the old tradition in the land, adding to it the strength and not the fury of the new light. Such a "patriot king," dreamed of idly by Bolingbroke when too late, might then have warded off the evil rebellion and the sordid reaction.

IV.

But these things lay in the lap of Chance, and Chance set over the land the man of all others fit to confound confusion. Yes, if there is any one truth to be guessed from the vicissitudes of that age it is the incalculable power of that Fortune whose whim, according to Julius Cæsar, and he should have known, governs mankind—*fortuna cuius libido gentibus moderatur.* Looking over the unnecessary calamities of

those years, considering the inconsequence of great things and the fatality of contemptible things, and perceiving the tremendous and unending moral results that waited upon the hazard of one man's character, one may conceive that history was the work of such a Provident Deity as Bossuet proclaimed, who bends human affairs to his unfathomable arbitrary will, and who was laying upon England the punishment of distractions for her heresy, or one may humbly lower the eyes before that "Nothing" of the skeptical Earl of Rochester:

Is, or *is not*, the Two great Ends of Fate,
And, true or false, the Subject of Debate,
That perfect, or destroy, the vast Designs of Fate;—

but it is inconceivable that one continuous or parallel reign of mechanical law and reason governed that world of mishap, as Descartes and the men of science were beginning to teach. Physical cause and effect proceeded with immitigable regularity, and so with moral law, but where the two realms overlapped was an incommensurable disproportion, a strip of blind chaos, unknown and untravelled by reason, out of which came and went the busy emissaries of Chance.

And Milton was at once the victim and the agent of this lady of misrule. Fancy loves to evoke what might have been the reality, but was not. Instead of that scene in Bunhill Row, I behold our greatest poet, the darling and spiritual aid of a brave government, now in his reverend years, surrounded by "honor, love, obedience, troops of friends," handing on to his disciples the unquenched torch of England's mighty inspiration, and then turning finally to his quiet end—

And may at last my weary age
Find out the peaceful hermitage,
The hairy gown and mossy cell,
Where I may sit and rightly spell,
Of every star that heaven doth shew,
And every herb that sips the dew;
Till old experience do attain
To something like prophetic strain.

All the traits of his early works pointed him out for that high mission—the gravity of his character, his native mastery over words, his ineffable gift of harmony, his splendid imagination, his deep knowledge of human destinies. He alone might have accomplished what Ben Jonson had not the genius to do. He might have preserved the soaring inspiration of the Elizabethans, yet chastening it in form by his classical discipline, so that it should have remained a sound and authoritative model of art; and enlarging it to embrace both the forward-looking uplift of true Puritanism and the reverence for remembered gracious things of the Cavaliers, so that he should have imposed himself on the nation, not as one whose "predominant desire was to destroy rather than establish," but as indeed the "god-gifted organ-voice of England." Our life might have been ruled by him as Greek was moulded by Homer, to the avoidance of much wasted energy and of innumerable false starts. How nearly he missed his supremacy can be seen from the homage bestowed on his name at this centennial of his birth; yet a candid survey of our literature must still add that he has been in essential things a hero "admired rather than imitated."

V.

This failure is due, in part, to the deviation of the people from their natural course, but in no small part to the thwarting of the poet's own development. For it is undeniable that the effect of events was to exaggerate in Milton certain dangerous tendencies which might have been restrained and guided into virtues. One sees this more strongly perhaps in his prose than in his verse. It is a sad task to read his noble enthusiasm for true liberty in the "Reformation in England," published in 1641, and to think then of what was actually to come. Who does not know its peroration?—

O thou, that, after the impetuous rage of five bloody inundations, and the succeeding sword of intestine war soaking the land in her own gore, didst pity the sad and ceaseless revolution of our swift and thick-coming sorrows; when we were quite breathless, of thy free grace didst motion peace and terms of covenant with us; and having first well nigh freed us from anti-Christian thralldom, didst build up this Britannic empire to a glorious and enviable height, with all her daughter-islands about her; stay us in this felicity, let not the obstinacy of our half-obedience and will-worship bring forth that viper of sedition, that for these fourscore years hath been breeding to eat through the entrails of our peace. . . .

Then, amidst the hymns and hallelujahs of saints, some one may perhaps be heard offering at high strains in new and lofty measure to sing and celebrate thy divine mercies and marvellous judgments in this land throughout all ages. . . .

There is a note of magnificent expectation here that not Burke or any other was ever again to attain; and then, with that sound ringing in our ears, we turn to the leaden pedantries, the smouldering malignity, the hateful scandal-mongering of the two "Defensiones" written later by Milton as the official mouthpiece of the Commonwealth, to excuse to the world its criminal excesses. The change, with all it implies, is inexpressibly disheartening. Nor did he escape in more intimate matters. From upholding the false liberty of government he passed naturally, at the first pinch of circumstance, to a plea for personal license. In 1643 he married Mary Powell; in the same year, apparently before the honeymoon had ended, he was composing his address to Parliament on "The Doctrine and Discipline of Divorce." But a little while before, in his "Reformation," he was saying: "Well knows every wise nation that their liberty consists in manly and honest labors, in sobriety, and rigorous honor to the marriage-bed"; and now he cannot endure soberly a few weeks of annoyance, but will for his relief rush in and alter the laws of the land. Because the experience of the race would hold him to an uncongenial bond, he must cry out against "the inveterate blots and obscurities wrought upon our minds by the subtle insinuating of error and custom." His argument is conducted with gross sophistries and wresting of Scripture texts. His thesis is, in Miltonic language, that "the pining of a sad spirit wedded to loneliness should deserve to be freed"; in the cant of modern tongues, that husband and wife who find themselves of incompatible temper should forthwith separate, without even recourse to a court, and seek their "affinities." In his indecent haste he has no regard for the obligation of contract or for the discipline and ultimate happiness of a mutual accommodation. The ways of Milton with his wives and daughters, make what apologies we can, are not the aspect of his life we care to dwell upon.

VI.

Fortunately, his poetry, as it moved in a more ideal sphere, escaped the worst of these evils; yet even here there is much to regret. Only national prejudice can be blind to the defects of "Paradise Lost." In his second period, says Taine,

An epic writer and a Protestant, enslaved by a strict theology, robbed of the style which makes the supernatural visible, deprived of the dramatic sensibility which creates varied and living souls, he accumulates cold dissertations, transforms man and God into orthodox and vulgar machines, and only regains his genius in endowing Satan with his republican soul, in multiplying grand landscapes and colossal apparitions, in consecrating his poetry to the praise of religion and duty.

The emphasis may be misplaced, there may be grave omissions, but as a whole that is likely to remain the honest opinion of the world in regard to our English Homer. The native-born will be carried by the sweep of Milton's language more lightly over these bogs, and the national ideals reflected in its plot will endear even its faults to patriotism; but a nicer judgment will always see much to offend. I do not believe there is in the literature of the world anything comparable to the fourth book of "Paradise Lost" for its extreme contrast of good and bad taste. From the evening hymn of Adam and Eve, with its exultant ecstasy of pure religion, we pass to echoes of a mean and wrangling theology, from the radiant glories of Eden spread before our view and from the loveliness of "espoused Eve," we are

cast into a frigid Puritanical discussion "of purity, and place, and innocence." These contrasts are the measure of Time's injury. What that epic might have been, if Milton had brought to it the gravity of political experience without the exacerbation of faction, may be surmised from the flawless beauty of the last poem of any length written by him before he was caught into the political and religious vortex.

VII.

In the autumn of 1637, at the end of his "long holiday" at Horton, Milton was asked to contribute to a book of elegies celebrating the death of Edward King, a fellow of Christ's, Cambridge, where Milton had known him in his own college days. From this request came "Lycidas," the "touchstone of poetic taste," as Tennyson, speaking with authority, pronounced it to FitzGerald. It has been commonly observed that the poem contains little grief for a personal loss, but borrows its emotion from the larger religious issues then beginning to weigh upon the author's mind. The criticism is obvious. It should be added, however, that the poem is still an elegy, to the reader of to-day even more perhaps than to the writer, a magical dirge over an age passing away with its destiny unfulfilled. When we read the lament:

But, oh! the heavy change now thou art gone,
Now thou art gone and never must return!
Thee, shepherd, thee the woods and desert caves,
With wild thyme and the gadding vine o'ergrown,
And all their echoes mourn.
The willows and the hazel copses green
Shall now no more be seen
Fanning their joyous leaves to thy soft lays—

we should know that it is not the death of the obscure collegian that communicates to us the thrill of strange emotion, and that these metaphors of nature are not a meaningless convention; this heavy change is for the disappearance of a whole imaginative world, with its "wood notes wild." And so we may follow the poem through all its ebb and flow. The sorrow of Camus, and the shuddering denunciation of the Pilot of the Galilean lake, are not, as their sound reaches us now, solely for the evils of prelacy; we hear also the vulgar and hypocritic zeal of many Puritans who,

. . . when they list, their lean and flashy songs
Grate on their scrannel pipes of wretched straw.

And we remember the promise and lofty lives of those divines of Cambridge, of Benjamin Whichcote, a scholar there in Milton's day, and his companions, who refused the Covenant and took from Puritanism its enthusiasm without its intolerance—and all that promise made of no avail. And if at the end of the poem Milton rises to a height of celestial vision such as no poet before or after ever reached in English words, the joy of that prophecy is for us strangely mingled with pain. For one who can set himself apart perhaps, but in no wise for England, was that lost spirit made "the genius of the shore." While for Milton, who was then "mewing his youth" and preparing for his proud ambition of singing such things as the world would not willingly let die, there were no "fresh woods and pastures new," but the fields over which rolled the hideous clamor of civil war.

P. E. M.

NEWS FOR BIBLIOPHILES.

The catalogues of portions of his great library which have been printed by J. Pierpont Morgan, have scarcely been noticed in the public press. The catalogue of the library of James Toovey, which he purchased entire, came out several years ago. More recently Mr. Morgan has issued a catalogue of manuscripts and early printed books, mainly from the libraries of William Morris, Richard Bennett of Manchester (who purchased the larger part of Morris's library), and the Earl of Ashburnham. The manuscripts form one volume and the printed books three, large quarto, from the Chiswick Press. Of the catalogue of manuscripts, prepared by M. R. James, five copies on vellum and 170 on paper have been printed; and of that of books, five on vellum and 120 on paper. The manuscripts described are Bibles, Missals, Psalters, and Horæ (but none of the modern manuscripts, such as have been recently exhibited at Columbia University), and the volume contains forty facsimiles in colors and five plates of bindings. The early printed books have been described by E. Gordon Duff, the late Robert Proctor, and others; the introduction is by Alfred W. Pollard. In some ways the most remarkable book in the list is the great Mainz Psalter of 1459, printed by Fust and Schoeffer, the Sykes-Thorold copy, for which Quaritch paid £4,950 in 1884, keeping the book in stock for over twenty years. The books printed in England include a long series of Caxtons, mostly from the collection of the Earl of Ashburnham. The catalogue is in every way a notable work.

The "Catalogue of Books Printed in the Fifteenth Century Now in the British Museum" is to appear at an early date. It is in six parts. The twenty-nine plates will give reproductions of more than 240 types used at Mayence, Strasburg, Bamberg, and Cologne.

An exhibition commemorative of the tercentenary of the birth of Milton will be held at the Grolier Club in this city December 4 to January 9.

The second portion of the library of Henry W. Poor will be sold by the Anderson Auction Company of this city December 7, 8, and 9. Among important older books are: a manuscript Latin Bible, dated at the end 1425; several manuscript Books of Hours of the fifteenth century; Dante's "Divina Commedia," with Landino's commentary and with three (only) copper plates by Botticelli; the Aldine Horace of 1519, and several other books from the Aldine Press; and thirteen items from the Elzevir Press, including De Laet's "Novus Orbis seu Descriptionis Indiæ Occidentalis" (1633), pages 101 to 110 of which contain a description of New Netherlands. Of early English literature this part includes: Roger Ascham's "The Scholemaster" (1571), second edition; Montaigne's "Essaies" (1603), the first edition of Florio's translation; Chapman's translation of the Iliad (about 1611), the first complete edition, lacking six leaves at the end; Killigrew's "Works" (1644), first edition; Marlowe's "Dr. Faustus" (1663); Donne's "Poems" (1639), and John Davies's "Summa Totalis" (1607). The McKee copy of Robert Hayman's "Quodlibets, lately come over from New Britaniola, Old Newfoundland" (1628), a curious book, in verse, is the most important early item of Americana. There are many first editions of nineteenth century authors, among them such rarities as Bryant's "White-Footed Deer" (1844), Lowell's "Il Pesceballo" (1862), earliest issue, and his "Vision of Sir Launfal" (1848); Hawthorne's "Gentle Boy" (1839), and the rare second edition of "The Celestial Railroad" (1847); Holmes's "Poems" (1836); Longfellow's "Ballads" (1842), a presentation copy in the original boards; George Eliot's "The Legend of Jubal and Other Poems" (1874), one of twenty copies printed on thick paper, with an important A. L. S. of the author referring to the book inserted; Tennyson's "Poems of Two Brothers" (1827), large paper copy; also the privately printed "Sailor Boy" (1861); Scott's "Waverley" (1814) and "Ivanhoe" (1820), and Thackeray's "Virginians," in parts. Among important sets are *Notes and Queries*, 119 vols., and a complete set of the publications of the Folk-Lore Society of London, 50 vols. in cloth, and 23 parts in paper covers. The frontispiece of the catalogue is a reproduction, in colors, of the binding of Mr. Poor's copy of William Loring Andrews's "New Amsterdam, New Orange, New York," one of the thirty Japan paper copies. Another reproduction shows the binding of Brown's "Self Interpreting Bible," New York, 1792, described as probably the finest specimen of early American book-binding in existence. This volume was shown, November, 1907, at the Grolier Club exhibition of American book-binding before 1850.

In Hodgson & Co.'s sale, London, November 6, the first edition of "Gulliver's Travels," large paper, with the frontispiece portrait in the correct first state, brougbt £85. Other important items sold as follows: Burton's "Anatomy of Melancholy" (1621), first edition, £28; a set of *Botanische Zeitung*, £43; Andrew's "Geraniums," two volumes, £21.

At a sale of autographs and manuscripts at Sotheby's, London, November 16 and 17, the original assignment by John Keats to Taylor & Hessey, the publishers, of the copyright of his two books, "Poems" and "Lamia, Isabella, the Eve of St. Agnes, and Other Poems," dated September 16, 1820, brought £50. Other prices were: Charles V of France, sign manual to an ordinance, of date 1356 to 1360, £49; Edward VI of England, sign manual to a warrant, £54; Henrietta Maria (Queen of Charles I), A.L.S., £20; Charles Lamb, interesting A.L.S., £21; and Cotton Mather, A.L.S., accompanied by tbe mezzotint portrait by Pelham, £38.

At C. F. Libbie & Co.'s sale at Boston,

November 23-25, a fine copy of Penhallow's "History of the Wars of New England With the Eastern Indians" (Boston, 1726), brought $530, the record price; Whittier's "Moll Pitcher" (1832), original paper covers, somewhat faded, $370, also the record. No copy with both covers has heretofore been offered at auction, though there is one in this condition in the Chamberlain collection. Another valuable item was Poe's "Tales of the Grotesque and Arabesque" (1840), two volumes bound in one, the copy given by the author to "Miss Anna and Miss Bessie Pedder," with autograph inscription, $290. Other prices were: FitzGerald's "Euphranor" (1851), the author's first book, $30; his "Polonius" (1852), $21; and "Agamemnon" (1876), $11, all first editions; Mrs. Eddy's "Science and Health" (1875), first edition, $70, and the first edition of Vol. II, 1878, $53; and a mezzotint portrait of Washington, "Published March 14, 1801, by J. Hinton," $85.

The price of Beverley's "History of Virginia," in the Poor sale, was $100 instead of $180, as given in this column a week ago. Since the book seldom sells for as much as $50 at auction, and since it is not uncommon, even $100 may be called an absurd price.

Correspondence.

TARIFF REFORM AND A RESPONSIBLE MINISTRY.

To the Editor of The Nation:

Sir: An article in your paper of November 19 leads to the following reflections: that there never will or can be any effective reform of the tariff till the whole subject is placed in the hands of the Secretary of the Treasury, dealing at once with expenditure and revenue and entrusted with the duty of preparing, presenting, and defending in open session of Congress a plan of reform; that this plan and no other, and without modification except such as he chooses to accept, shall, after reasonable discussion, be put to a vote. What the ultimate result may be is another question, but the necessity of going so far may be easily shown.

For this purpose, let us consider the course of legislation. The composition of both houses is the same. Both are made up of representatives of local districts. There is nobody representing or clothed with authority to speak for the whole as a unit. The duty of each member is to look after the interests of his own constituents, and only to a very limited extent after those of others. It is an old saying that what is everybody's business is nobody's. Any member of both houses can introduce as many bills as he pleases, upon any subject he pleases, and all are thrown into committees of these local members. Log-rolling and trading, with a complete absence of personal responsibility, are the inevitable result. The executive, which alone represents the whole country and the administration of the government, is never heard at all, unless summoned or admitted before the committees. Its only means of influence is to join the universal practice of lobbying, and it can never be held to any responsibility except by a process of impeachment. It is not rash to say that if there were a Democratic President and a Democratic majority in both houses, private interests would still rule, and the fortress would still remain impregnable. The condition of things is so absurd as to be almost incredible, if it did not rest on a stubborn basis of fact; and, what adds greatly to the interest, it is repeated with slight modifications in every State, and in principle in every city in the Union.

On February 4, 1881, a unanimous report of a committee of eight members of the Senate recommended the admission of the members of the Cabinet to Congress on certain days and under certain conditions, in conformity with the practice of almost every other government in the civilized world. The absorption of all power by the Legislature has prevented since the slightest attention to that plan.

The history of tariff reform in Great Britain in the first half of the last century and the maintenance of free trade ever since furnish an illustration of the strongest and most concrete kind, and the first step towards the introduction of the principle here must be made, if at all, by diverting attention from the product to the machinery. The Federal government is on too large a scale to furnish original results, but the initial experiment is perfectly easy in any one of the forty-six States, and only needs a little insight and resolution on the part of a Governor to win for himself and his State a world-wide and lasting renown. G. Bradford.

Boston, November 23.

WHY AMERICANS ARE NOT POLYGLOTS.

To the Editor of The Nation:

Sir: May I say a word on the subject recently discussed in the article entitled "Underlanguaged Americans" (October 15)? When the writer says that "habit, propinquity, utility, the constant mingling of peoples and languages, have helped to make the Continentals the linguists they are," I believe that he gives the real causes; but when he goes on to say that "the chief reason of their superiority to us is their better teaching of modern languages in the schools," I cannot agree with him. The real cause above all others of the Continental's superiority to us is, I hold, "propinquity." From this arises "constant mingling of peoples and languages," from this comes "utility," and a combined result of all these is "habit." We shall find that the inhabitants of small countries, surrounded as they are by people of different tongues, are *forced* to become polyglots. Even though it be not uncommon for a Belgian to speak English, French, German, and his own Flemish, yet no one would maintain that superiority in such a case is due to better instruction in the schools. It is due to pressure from without. A widespread practice originating in necessity may develop into a national trait, but the extent to which "habit" does determine the Continental's aptitude toward the acquisition of other languages cannot be accurately measured and gives room for wide speculation.

The most tangible incentive to the learning of foreign tongues is, beyond doubt, "utility" or expediency, and so it has ever been. The Greeks and the Romans had to learn something of the languages of their subjects. In modern times the English had to gain some acquaintance with the tongues of India. At the close of our war with Spain, when it seemed probable that Spanish would be of practical use, many Americans in a short time learned to speak Spanish.

All concede that instruction in a German gymnasium is excellent, for the thoroughness of German scholarship is incontrovertible testimony of the thorough groundwork laid in the lower schools. But one thing seems certain, and that is that the teaching of English as a living language in the German universities will not bear comparison with the teaching of German or French in our best colleges. Any one who has visited the classes in a German university will readily admit this.

Among scholars I maintain that it will seldom happen that the more common modern languages will not be understood. "Professor Royce's paper," you say, "was easily followed by the audience" of scholars at Heidelberg. But such an assembly is not quite parallel to the Tuberculosis Congress at Washington. A nearer parallel would be such a meeting as was held at the opening of the Harvard Graduate School in 1904. At that time several addresses were made in German and French by distinguished visitors and they were "easily followed by the audience" and were "applauded throughout." It is true that Professor Sievers of Leipzig spoke in English, but we must now recall the fact that last year President Hadley was able to address his Berlin audience in German. I believe that ability to speak or understand a foreign tongue is as widespread among the scholars of this country as of any other country. It is the general mass of people that is deficient in this respect, and only when it becomes a matter of expediency—a question such as faces the Continentals to-day—can we expect the "underlanguaged Americans" to become glib polyglots. G. C. Scoggin.

University of Missouri, Columbia, November 20.

A TRANSLATION OF FEUCHTERSLEBEN'S "ZUR DIÄTETIK DER SEELE."

To the Editor of The Nation:

Sir: In your issue of November 19 is an interesting letter of Gustav Pollak on a "Physician of the Soul, Seventy Years Ago," in which the statement is made that Feuchtersleben's "Zur Diätetik der Seele" (The Hygiene of the Soul) has never been translated into English. I have in my library a translation into English of Feuchtersleben's work, with the title, "The Dietetics of the Soul." This translation, on its title page, is said to be "edited by Col. H. A. Ouvry, C.B., and revised from the thirty-second German edition." It bears the imprint, London: Kerby & Endean. 1873. James W. Holland.

Philadelphia, November 20.

To the Editor of The Nation:

Sir: Your issue of November 19 contains a communication from Mr. Gustav Pollak, in which, speaking of Ernst Baron von Feuchtersleben's "Zur Diätetik der Seele," he says: "It has never been translated into English." Mr. Pollak is in error. For many years I have been the possessor of an

English translation of the work. I do not know who made the translation. It seems to have been well done. The title page of the book is as follows:

The Dietetics of the Soul by Ernest von Feuchtersleben, M.D. Valere Aude. Edited from the Seventh Edition. New York; C. S. Francis & Co., 252 Broadway. Boston; Crosby, Nichols & Co. MDCCCLVIII.

O. K.

Detroit, November 28.

Notes.

The British League of the Empire will soon publish a "Text Book of the History of the British Empire," prepared under the general supervision of an editorial committee, of which Prof. J. B. Bury, Regius professor of modern history at Cambridge, is chairman; A. F. Pollard, professor of history at the University of London, will edit the book. Professor Pollard has himself written the section treating of the United Kingdom. The Canadian section has been written by Lawson Grant; the New Zealand section by Dr. F. W. Pennefather; and the West Indian section by N. Darnell Davis. Other contributors are: Sir Frederick Pollock, A. W. Jose, Dr. A. J. Herbertson, E. I. Carlyle, R. W. Frazer, and H. W. Wilson. A part of the gift of £5,000 to the league by the late Louis Spitzel will be used in producing the work, which will be sold at such a low price as will bring it within the reach of a large number of readers.

On the ground of expense, the British government has decided to discontinue the calendaring of the Acts of the Privy Council of England, on the completion of that service with respect to the reign of Queen Elizabeth, ending in 1603—a service upon which Sir John Dasent has been engaged for the last twenty years. At the same time, provision has been made for the publication of calendars of such of the Privy Council Records as relate to America and the West Indies. This work has been intrusted to Lawson Grant, the assistant lecturer, since 1906, to the Beit professor at Oxford. His first calendar, expected this month, will cover the years to 1680 (June). Most of the volumes of acts between 1603 and 1610 are missing, hut abstracts of some of these are preserved at the British Museum. Some of the papers calendared have already been noted in the Calendars of the Colonial Series of State Papers, issued by the Public Record Office, but they will be treated at greater length in Mr. Grant's calendar. The bulk of the matter will provide fresh material for the history of the colonial period of the United States.

"Race Questions and Other American Problems," by Prof. Josiah Royce (The Macmillan Co.) consists of five addresses, each containing some practical application of the doctrine of life elucidated in Professor Royce's recent volume, "The Philosophy of Loyalty." The application is most direct in the last chapter, which deals with the need of healthful development on the motor side if the whole human organism is to be made an effective instrument of loyalty to worthy causes. The kind of loyalty defined and supported as a proper motive in athletics is, of course, carefully distinguished from that form which merely gathers enormous crowds of excited humanity and rends the air with shouts but does not think. Unfortunate social conditions have harmfully influenced the ethics of athletic sports by subjecting them to the confused and unprincipled sentiments of great crowds of people. There must be clear-headedness, self-possession, if the latent moral benefit is to be realized. "Nobody can learn loyalty from mobs. The Harvard Stadium is an admirable place when it is not too full of people." In all these chapters "clear-headedness" is really as important a key word as "loyalty" itself. The initial chapter, "Race Questions and Prejudices," is chiefly an exhortation to get rid of stupid pre-judgments, resting on untenable foundations, and look on the individual possibilities and interrelations of races in the calm light of reason and evidence. The second chapter is noteworthy for its forcible plea for a clear-headed "provincialism," that intelligent loyalty to the lesser group which is needed to save the individual from the levelling tendencies of the age. Humanity, patriotism, all the legitimate interests of broader scope, will best thrive only as the smaller community shall live its own life, and not the life of any other community, nor yet the life of a mere abstraction called humanity in general. Outside influences upon the smaller group are inevitable, but a clear-headed provincial self-consciousness and pride will control and assimilate these influences, not fall and be crushed by them. The levelling spirit of the time gives the mere crowd, reading the same newspapers, thoughtlessly accepting the impressions of the mass, and liable at any moment to be swept into folly and crime when some special excitement transforms the mass into the mob. In the rightly constituted social group, on the other hand, each one feels his separate responsibility, individual reacts beneficially upon individual, and the combined result may be a wisdom superior to that of any separate member of the group, not a folly of which each one independently would be wholly incapable, as in the case of the mob. Apart from the strong common sense of his views and their bearing upon the immediate problems of life, Professor Royce wields an uncommonly lucid and forcible pen. This volume makes a plain and important appeal to any intelligent man or woman, and should have a wide reading.

"Recollections of a Varied Career," by William F. Draper (Boston: Little, Brown & Co.), is the story of a life that is interesting and remarkable. Born in 1842, Gen. Draper came in boyhood into the environment of the well-known Hopedale Community, in Massachusetts, working in mills of which his father, uncle, and other relatives were managers. Enlisting as a soldier, he followed during the civil war the fortunes of the Ninth Corps, at New Berne, Antietam, Fredericksburg, Vicksburg, and Knoxville. In 1864, in the Wilderness, he was severely wounded, but was absent from his place only for a brief space. He was in the front before Petersburg, reaching the rank of general at the age of twenty-two. A place awaited him in the Hopedale mills, where he rose rapidly to a chief position, exhibiting mechanical ingenuity as well as business shrewdness. The mills became highly profitable largely through his efforts, whereupon Mr. Draper entered upon still another field. He was elected to Congress where he presently made a good reputation. It would do him injustice to suppose he promoted a high tariff for any other reason than what he thought to be the public good; but all the same he feathered well his own nest thereby, and doubtless the Hopedale Company was entirely satisfied to have a partner engrossed in such legislation. Finally, Mr. Draper exchanged Congressional for diplomatic service, becoming minister to Italy, where his good sense, geniality, and aptness in foreign tongues, backed up by a handsome fortune, made his incumbency rather memorable. In all his varied life, as soldier, business manager, legislator, and diplomat, this typical American seems to have always fallen upon his feet, and yet it may be suspected that his very versatility has been a snare to him, as to many another capable man. His widely differing undertakings interest him about equally; he pursues each in turn with zeal, but presently drops it for another. In no line does he reach the top. His brilliant opening as a soldier is cut short by circumstances. Possibly his heart was more in this life than any other; he gave it up apparently with regret, and would gladly have returned to it if he could, during the war with Spain. Though his mechanical ingenuity is marked, he does not carry out the aptitude to the point of becoming a noted inventor. Though a good manager of affairs he cannot be classed among the famous captains of industry. At Washington, he is wide awake and adroit rather than solidly able and statesmanlike. He discharges efficiently the duties of a second-class mission, but his narrative here offers pleasant gossip about high society rather than sober discussion of the international problems which profoundly vex the nations.

In reading "Ocean Life in the Old Sailing Ship Days" (Little, Brown & Co.) one is constantly led to wish that better use had been made of the abundant material at the disposal of its author, Captain John D. Whidden of Boston; for occasionally he essays a literary flight outside his usual record in log-book style, and these excursions seldom fail to interest, instruct, or amuse. The story he tells is of a simple and worthy life, spent until 1870 in the merchant service, whose ways and customs are truthfully and sympathetically described. When the demand for quick freights in swift sailing vessels disappeared, the American mercantile marine practically vanished from the face of the waters and the writer wisely sought occupation ashore. The real cause of this decline he finds in our protective system which has resulted, as he justly perceives, in shutting us out of the one field where free trade must always prevail:

With the ending of the war all hoped that the tariff, especially on shipping, would be reduced, to enable our shipyards to again resume building, and enter into competition for the world's carrying trade, where we had lost prestige; but it was not to be. The tariff was still kept on, the same as during the war, and no one, under these conditions, was insane enough to build. The carrying trade of the world that should have been in American bottoms was allowed to slip from us, and with

it one of our finest New England industries—shipbuilding.

Our legislators should read these pages written in unconscious support of the present movement to strike the tariff shackles from American industries.

"Out-of-Doors in the Holy Land," by Dr. Henry Van Dyke (Charles Scribner's Sons), is an account of a trip to Palestine made on condition of writing out the impressions of the journey for *Scribner's Magazine*. The little volume is dainty, charmingly illustrated with a dozen colored plates, in fine, a beautiful picture book of the Holy Land and a suitable gift book for Christmas. There is nothing new in it, and yet the author has added to the literature of the Holy Land something worth having in the record of impressions made by the land itself, its people, and its pilgrims on a devout and poetic soul. Palestine was, in a certain sense, a religious revelation to Dr. Van Dyke, and that revelation he has sought to transmit to his readers. Seeing with sympathetic eyes and interpreting with much insight, he casts a glamour of love and reverence on barren hills and fond superstitions. Part of this effect he has endeavored to convey by a series of poems interspersed among the chapters of description. In versification and spirit these poems remind one partly of Walt Whitman, partly of the Bible. To some they will doubtless seem beautiful and original; to others, only prose reflections of greater originals. The narrative passages are generally charming, despite some little affectations. The basis of the book, as set forth in the preface, Dr. Van Dyke's "new conviction that Christianity is an out-of-doors religion," may prove of use to those who have been trained to look at the Bible only as a collection of theological texts. But we venture to think that the "out-of-doors" in Palestine would not so greatly impress any observer were it not for the meaning of the land itself to the world. This fact Dr. Van Dyke brings out in the chapter in which, passing over from the ruined cities of Decapolis and the grander trans-Jordanic region to Palestine proper, he thus describes the difference which makes the latter, not the former, the country of real interest:

> In the little land between the Jordan and the sea things came to pass which have a more enduring significance than the wars and splendors, the wealth and culture of Decapolis. Conflicts were fought there in which the eternal issues of good and evil were clearly manifest. Ideas were worked out there which have a permanent value to the spiritual life of man. Revelations were made there which have become the guiding star of succeeding generations.

"Washington: The City and the Seat of Government," by C. H. Forbes-Lindsay (Philadelphia: The John C. Winston Co.), contains excellent illustrations, some twenty-five photogravures. The book itself, bound in red and gilt, resembles a style of literary product that used to lie on drawing-room tables, half a century ago. The text takes you along in that smoothly flowing way characteristic of the newspaper man who is doing his best to fulfil an engagement to "write up" the subject. Mr. Forbes-Lindsay is no better and no worse than the average of his class of hack-writers. He is serious, and he is, up to a certain point, painstaking, but he is not entertaining. Out of old material he has constructed a book that will meet the requirements of the reader who is not particular about accuracy in respect to minor details. What he has to deliver about the Supreme Court of the United States for example (p. 378) indicates that he is well beyond his depth, though only a lawyer might suspect the fact. Again, of Mr. Crawford, Secretary of the Treasury, he says (p. 164) that being "sent [in 1824] to the country for his health," he "betook himself to a remote house on Clement Hill, where at present Fourteenth Street intersects Massachusetts Avenue." As a matter of fact, upon elevated ground at the spot he mentions, Charles Hill, a wealthy land-owner, built in early days a large house—now owned by the Episcopalians as a bishop's residence. A nephew, Clement Hill, lived on H Street, in a house later occupied by George Bancroft. It is hardly needful to remark that no such locality as Clement Hill ever existed in Washington. In an appendix Mr. Forbes-Lindsay reprints a portion of an interesting little book (now out of print), "The Reminiscences of Christian Hines." There is no excuse for leaving out whole sentences of Christian Hines's text—jumbling together names and putting persons in squares where they do not belong. This book, to speak plainly, has no historical value. The ground has been recently travelled over by other writers, who are more entertaining and less inaccurate than is the present author.

The fifth volume of the translation of the "Memoirs" of Dumas (The Macmillan Co.) concerns itself with the years 1831-32. It begins with political riots, fantastic and short-lived military organizations, plots and counter plots, the machinations of courtiers, the social unrest, more Parisian than national, that made Louis-Philippe uneasy on his throne. It carries the reader through a world of anecdote, character sketches, public and domestic comedy and tragedy, until it ends with comments not serene, and criticisms far from suave, on the chief dramatic, literary, and artistic affairs of the day. They are truly "memories" (more or less trustworthy), always in the unresting manner of the romancer's own life, with nothing of the natural pensiveness of retrospect. Pages of irrelevant and monosyllabic conversation are followed by others so full of matter as to make reading a serious matter of unpacking. Still, the numerous stories and the author's amusing naïveté make the volume, like its predecessors, entertaining to dip into.

Christopher Hare has paraphrased Baldassare Castiglione's "Cortegiano" in an attractive volume entitled "Courts and Camps of the Renaissance" (Charles Scribner's Sons). "Paraphrased" is hardly a comprehensive enough word, because Mr. Hare not merely epitomizes the book itself, but gives a discursive account of Castiglione's life and of the stirring events which he saw. Castiglione's biography was well worth presenting in this fashion, and "The Courtier" is always in order. The contacts which such a man had with the great ones of his age, furnish a better insight into the human side of the renaissance than we often get when our attention is primarily directed to Alexander VI, or Julius II, or to the ambitious princes who competed for secular prizes. Castiglione's career and example remind us that a good man could succeed in an age which seemed callous to virtue. Many portraits from well-known paintings enhance the impression of reality which Mr. Hare's agreeable narrative makes upon us.

Students of Italian history may care to know that Prof. Luigi Colini Baldeschi has completed the task of classifying the very rich archives of Cingoli and will soon publish a detailed report of their contents. Cingoli is one of those towns in the Marches which passed through an era of marked economic and social development between the twelfth and fourteenth centuries. Much of the historical material of this period has been lost; some has been published, but a large amount remains unexplored in town and parish records. The manuscripts of Cingoli, which are among the most valuable, begin in the first years of the twelfth century; and the documents of the first decades of the thirteenth century are especially numerous.

Zanichelli of Bologna announces the early publication of the nineteenth volume of Carducci's writings. It is now evident that it will be impossible to complete this edition in twenty volumes as originally announced. Even thirty volumes may not suffice, if the numerous introductions which Carducci wrote for Barbéra's Diamond Editions are included. The reprinting of these prefaces begins in the forthcoming volume, which bears the title, "Melica e Lirica del settecento con altri studi di varia letteratura." The contents include studies of Pietro Metastasio, Giovanni Fantoni, Ugo Foscolo, Alberto Mario, the erotic and lyric poets of the eighteenth century, and an unpublished essay upon the Court of Rome, based upon some letters from the Abbot A. Niccolini to Monsignor G. Bottari. It is also announced that a committee of French and Italians has been formed to erect a monument to Carducci in Paris.

"Dante e la Lunigiana" (Milan: Ulrico Hoepli) comprises nearly a dozen essays, written by Italian Dantists to celebrate two years ago the 600th anniversary of the poet's coming into Valdimagra. The subjects are critical, literary, historical, biographical, and geographical. Among the contributors are such authorities as Senator D'Ancona, Prof. I. Del Lungo, and Prof. P. Rajna. One section is devoted to sketches of Lunigianese students who have been experts in Dante. Many half-tone pictures really illustrate the district or reproduce documents, and there is a considerable bibliography. A companion volume, "Dante ed i Malaspina," by Giovanni Sforza, is in press. The present collection of essays gives a fair sample of the methods and range of specialized Dante studies in Italy.

Prof. Raffaello Fornaciari has gathered into a volume entitled "Fra il Nuovo e l'Antico," a score of literary papers, long and short, which he has contributed during the past half century to Italian journals. The topics range from "The Sentiment of Humanity in Greek Literature," to secondary figures like Vettori, Caro, Manni, and Monti, and to grammatical studies of the historical imperfect and the pronoun "lo." (Milan: Hoepli. 6 lire.)

"Schubart: ein deutsches Dichter- und Kulturbild," is the title of a volume by Karl Maria Klob (Ulm: Heinrich Kerler), which transports the reader into the time when Prince Karl of Würtemberg lorded over his people, not only as absolute mon-

arch, but as infallible arbiter of taste. The work may prove useful to the student of the German poetry of the period, and especially of Schiller's first period, the youthfully rebellious storm and stress of which was largely due to the tyrannical pressure under which he chafed in the famous Karlsschule.

Otto Hauser, whose reputation as a linguist and metrical translator completely overshadows his merits as writer of orlginal fiction, drama, and verse, is adding constantly to his already long list of works. He has published anthologies of Flemish, Belgian, Danish, Japanese, and Chinese poetry; has rendered into German Verlaine, Dante Gabriel Rossettl, Swinburne, Wilde, Longfellow's "Evangeline," Van Eeden's "Ellen," and a Croatian comedy of the renaissance. Now he appears in Die Literatur, edlted by Georg Brandes (Berlin: Marquardt & Co.), as the author of a brief history of Chinese poetry. The little volume is clearly and concisely planned, and popularly written. It contains nine illustrations, among them portraits of Emperor Kien Long, Confucius, and Meng Tse, and some charming pictures inspired by poems of Litaipe.

The stream of books on Goethe seems to be unending. Ludwig Geiger, professor at the University of Berlin, and recently created Geheimer Regierungsrat, has published (Leipzig: R. Voigtländer) "Goethe und die Seinen: Quellenmässige Darstellungen über Goethes Haus." This book of nearly four hundred pages affords intimate glimpses of the family life of the poet, a subject of perennlal interest both to the student and the general reader. The charming personality of Goethe's mother continues to tempt the writer of literary portraits. Johannes Höffner has written "Frau Rat Elisabeth Goethe, geb. Textor" (Bielefeld: Velhagen & Klasing); and Elisabeth Mentzel, author of a history of the theatre of Frankfort, has added "Frau Rat Goethe: Ein Lebensbild" (Frankfurt-am-M.: Neuer Frankfurter Verlag). One of the most interesting new editions of Goethe's poems is edited by Ernst Hartung, under the title "Goethes Gedichte im Rahmen seines Lebens" (Munich: Wilhelm Langewiesche-Brand). The seventh volume of nearly three hundred pages contains "Ueber allen Wipfeln." The work is illustrated.

"Schiller und Lotte: Ein Briefwechsel" (Jena: Eugen Diederichs) is the title of the correspondence between Schiller and his wife, which has been edited in two volumes by a descendant of the poet, Alexander von Gleichen-Russwurm.

That standard statistical annual, Otto Hübner's Geographisch-statlstische Tabellen aller Länder der Erde, has appeared for 1908, its fifty-seventh issue, edited by Prof. Franz von Juraschеck, president of the statistical Zentral-Kommission of Austria (Frankfurt-am-M.: H. Keller). The statistical data are, wherever possible, official.

Of the new six-volume "Weltgeschichte: Die Entwicklung der Menschheit in Staat und Gesellschaft, in Kultur und Geistesleben," edited with the coöperation of a score of specialists by Prof. Julius A. G. von Pflugk-Harttung, the fourth volume has been the first to appear. It is a history of the Reformation, by Prof. Theodor Brieger of Leipzig, with the special title: "Geschichte der Neuzeit: Das religiöse Zeitalter, 1500-1650." (Berlin: Ullstein & Co.). The author emphasizes the new things in Luther's ideas and thus opposes recent efforts to assign him rather to the middle ages than to modern times.

The American Economic Association will hold its twenty-first annual meeting at Atlantic City December 28-31. The American Association for Labor Legislation and the American Sociological Society will hold their sessions at the same time and place. The provisional programme of the Economic Association includes the following papers: President's address, S. N. Patten, University of Pennsylvania; "Theory of Collective Bargaining," J. B. Clark, Columbia, with discussion by A. C. Miller, University of California, G. E. Barnett, Johns Hopkins, T. S. Adams, University of Wisconsin, C. W. Doten, Massachusetts Institute of Technology, R. F. Hoxie, University of Chicago; "Accounting," W. M. Cole, Harvard; "Accounting in Its Relation to Economics," M. H. Robinson, University of Illinois; "The Present Position and Probable Development of Accountancy as a Profession," Joseph E. Sterret; "Capitalization of Public Service Corporations," Charles J. Bullock, Harvard; "Employers' Liability," M. O. Lorenz, University of Wisconsin, Miss Crystal Eastman, of the Pittsburgh Survey, C. P. Neill, United States Bureau of Labor; "Canadian Industrial Disputes Act," Adam Shortt, Civil Service Commission of Ottawa; discussion by O. D. Skelton, Queens University, and Dr. Victor S. Clark, Bureau of Labor, Washington; "Influence of Income on Standards of Life," Robert C. Chapin, Beloit; "Family in a Modern Mill Community," Miss Margaret F. Byington; "The Results of the Pittsburgh Survey," Dr. Edward T. Devine; "The Revision of the Tariff, H. C. Emery, Yale, N. I. Stone, Bureau of Statistics, Washington, Simon Lipman, University of Illinois; "A Central Bank," F. M. Warburg, New York, O. M. W. Sprague, Harvard, Horace White, New York, Joseph French Johnson, University of New York.

The exhibition of documents, at the Public Record Office, London, in connection with the celebration of the two hundredth anniversary of Lord Chatham's birth, included two or three documents of special interest to Americans. One was a list of English prisoners released from Canada, in November, 1759; wherein will be found several American colonists who served in Major Rogers's corps of Rangers. The following is a copy of a letter in Latin, sent to Chatham by his famous son, William Pitt, then a schoolboy at Brighton. The "Gulielmus Johnson, Eques Auratus," is, of course, Sir William Johnson, the victor over Baron Dieskau, and the superintendent over the Six Nations:

Mi Charissime Pater,—

Gaudeo audire te rursum bene valere. Vidimus Primates Mohecaunnuch et Wappinger Tribuum Indiorum a Septentrionale America qul veniunt in Angliam supplicare regem ob quosdam agros. Gulielmus Johnson Eques Auratus desiderabat auxilium eorum in bello et illi omnes abierunt ut pugnarent contra Gallos sed cum domum rediebant sentiebant Batavos arripuisse omnes suos agros. Vulgus apud Portland illos parum commode tractabat.

The documents were selected and arranged by Hubert Hale, director of the Royal Historical Society, and one of the senior members of the Record Office staff, to whose invaluable help and sympathy so many American students can testify.

A committee of prominent Harvard graduates, headed by Alexander Agassiz, has sent out the following appeal:

Charles William Eliot, after forty years of faithful and brilliant service, has resigned the presidency of Harvard University. We think this event should be recognized by some suitable action on the part of the alumni. With the coöperation of the Alumni Association we invite the graduates of Harvard University, and others who have been connected with it, to subscribe to a fund to be known as the Charles William Eliot Fund, the income of which shall be paid to President and Mrs. Eliot during their lives, and afterwards be used in such a manner as he may designate. It is especially desired that this fund should be, so far as possible, the gift of all, and the smallest contributions will be as gratefully received as the largest. Subscriptions, to which no publicity will be given, may be sent to F. L. Higginson, No. 50 State Street, Boston, Mass.

John Henry Wright, professor of Greek and, since 1895, dean of the Graduate School in Harvard University, died November 25 at his home in Cambridge. Professor Wright was born in 1852 at Urumiyah, Persia, where his father was then stationed as missionary. He was educated at Dartmouth and Leipzig, and in 1873 received the appointment of professor of ancient languages in the Ohio State University. From there he went to Dartmouth, thence to Johns Hopkins, and in 1887 to Harvard. He did a large amount of editing for classical and archæological journals, and published articles in them on various topics. One of his greatest editorial works was the supervision of "A History of All Nations," twenty-four volumes, 1902. He was eminently successful both as a teacher and an administrator.

John Bell Henneman, professor of English and dean of the College of Arts and Sciences in the University of the South, Sewanee, Tenn., died at Richmond, Va., November 26. He was born at Spartanburg, S. C., in 1864, and after graduation from the University of Virginia he taught in Wofford College. Then he studied abroad for three years and received the degree of Ph.D. from the University of Berlin. On his return to America he was professor first at Hampton-Sidney College, and then at the University of Tennessee. In 1900 he was called to Sewanee, and in the same year he began to edit the Sewanee *Review*. He was general editor of the Johnson Series of English Classics; with Prof. W. P. Trent he edited a complete edition of Thackeray in thirty volumes (1904), and "Best American Tales" (1907). In recent years he had devoted much time and energy to the movement for raising the scholastic standards of Southern colleges and universities, particularly by increasing the requirements for admission. His services to the cause of education were thus very important.

From Edinburgh comes the report of the death of George Seton in his eighty-seventh year. He had written much on Scottish heraldry and genealogy, including: "The Law and Practice of Heraldry in Scotland," "Cakes, Leeks, Puddings, and Potatoes," "Gossip about Letters and Letter-Writers," "St. Kilda, Past and Present," "Memoir of Chancellor Seton," "The House of Moncrieff," "A Budget of Anecdotes," and "The Family of Seton during Eight Centuries."

Eduard Woelfflin, professor of classical philology at the University of Munich, has died at Basle, his birthplace, at the age of seventy-seven. His best-known works are "Sentenzen des Publilius Syrus," "Asinius Polio de Bello Africo," and "Benedicti Regula Monachorum."

NOTES ON BOOKS FOR CHILDREN—II.

It is only within recent years that fairy tales have become folk-lore, and it is, perhaps, unfortunate that so many volumes for children are being compiled in accordance with this scientific view. This year, however, a score of volumes cater to the imaginative side of young readers. "The Elm-Tree Fairy Book" (Little, Brown & Co.) is the third in a collection being edited by Clifton Johnson, with the purpose of *softening* the action. We cannot approve doubtful material, but softening generally means weakening the interest of the story as a story. "Fairy Tales from Folklore" (Moffat, Yard & Co.) is by Herschel Williams, who has based his tales on material never before published. A third fairy book, under the editorship of Kate Douglas Wiggin and Nora Archibald Smith, bears the tempting title of "Tales of Laughter" (McClure). Scandinavia is well represented, with a scattering of old favorites, even to a selection from Lewis Carroll's "Sylvie and Bruno." "Gaelic Fairy Tales" (David Nutt) is a small book, prepared by Winifred M. Parker. Its title page reads: "Na Daoine Sidhe is Uirsgeulan eile"; the pages offer alternately Gaelic and an English translation; the elusive quality which marks the narrative, is not so foreign to the dreamy tendency of all children. William Elliot Griffis, in "The Fire-Fly Lovers" (Crowell), tells some fairy tales of old Japan. Clara Kern Bayliss, assisted by the clever brush of E. Warde Blaisdell, imitates Brer Rabbit in her "Old Man Coyote" (Crowell), a product of Western Indian tradition; these stories have variants among many tribes. "Stories of Persian Heroes" (Crowell), issued in a decorative volume, with colored borders, places Rustum, as a hero, beside Hercules and Alexander. E. M. Wilmot-Buxton, the author, will have done children a service if he succeeds in preparing the way for Matthew Arnold's "Sohrab and Rustum." Many old friends are to be found in "The Children's Treasure Trove of Pearls" (Little, Brown), edited by Mary Wilder Tileston. Maria Edgeworth, Juliana Horatia Ewing, and Lewis Carroll figure among the authors. "Johnny-Cake," culled from the *American Folk-Lore Journal*, is worth saving; its counterparts are many. "The Tortoise and the Geese" (Houghton Mifflin) is a collection of fables credited to Bidpai, and now freshly retold by Maude Barrows Dutton. La Fontaine and Æsop drew from this Indian philosopher, and we should imagine, to judge by the present book, surpassed him in liveliness. Edward Brooks has retold the "Wonder Stories from the Mabinogion" (Penn Publishing Co.), with an explanatory preface. It will be remembered that a book of like character was written by Sidney Lanier. "Stories of Wagner Operas Told for Children" (Bobbs-Merrill), by Elizabeth M. Wheelock, contains very little spontaneous narrative, although the events are faithfully followed. The cover design leads one to expect more. Lucy Fitch Perkins has decorated Edith Ogden Harrison's "The Flaming Sword" (McClurg), in which the author extracts certain lore from the Bible, treating the material purely as narrative. The moral attachment is a little too evident.

A fairy story which has enjoyed long popularity, George Macdonald's "The Princess and Curdie," is issued by J. B. Lippincott, with twelve illustrations in color by Maria L. Kirk. The volume is a companion to Macdonald's "The Princess and the Goblin," which the same publishers put on the market at this time last year. The type is large, the pictures are charming. Charles Kingsley's "Water-Babies," with color plates, and other pictures by Arthur Dixon, is published by E. P. Dutton & Co. Another welcome reprint is Mrs. Molesworth's "Fairies—of Sorts" (Macmillan), rather attractively illustrated by Gertrude Demain Hammond, and containing the tale of "The Groaning Clock." A cheap edition of Paul de Musset's "Mr. Wind and Madam Rain" has been published by the Harpers. "The Top o' the World," which was originally conceived by Mark E. Swan as the libretto for an extravaganza, was a most suitable entertainment for youngsters. Now that it has been turned into a book (Dutton), with illustrations by Hy. Mayer, it has lost some of its picturesqueness, though the story is just the same. L. Frank Baum his invented some "American Fairy Tales" (Bobbs-Merrill), which are more popular than they are striking, while, in "Dorothy and the Wizard in Oz" (Reilly & Britton), the same author exhibits his ingenuity in building upon the basis of a former success. The color plates by John R. Neill are out of the ordinary. The idea underlying H. Grace Parsons's "The Jimpy Stories" (Dutton) is excellent. Bedtime tales are needed, and were there not a certain irritating condescension in the style, Mother Goose as here used might prove excellent. No one understands better than Mrs. Frances Hodgson Burnett the difficult art of writing for children; she seems suddenly to have become endowed with a new quality marked by such an excellent narrative as "Racketty-Packetty House." This year "The Spring Cleaning" (Century), while it does not exceed "The Cosy Lion" in quaintness and excitement, is equally full of originality and spontaneousness. Indeed, there is no story we more heartily recommend than this in which the Green Workers with their hot-water bags and the Green Tuggers outwit the Frost Imps in their efforts to grow primroses for the benefit of Jane Ann Biggs. Mrs. Burnett's "The Good Wolf" (Moffat, Yard) is marked by the same excellent qualities; the instinctive humor and the unerring repetitions of effective phrasing are wholly commendable. Instead of acting as editor and compiler, E. V. Lucas this year figures as the author of "Anne's Terrible Good Nature, and Other Stories" (Macmillan); most of these tales are reprints, and probably there are some readers who already know "A Day in the Life of a Shilling."

Evidently Miss Mary Wright Plummer has received sufficient encouragement to persuade the loquacious Roy and Ray, who accompanied her to Mexico last year, to go this year through Canada (Holt). However excellent the material, we cannot overcome our dislike of the cross-question. Miss Plummer, who has done her work carefully, is a trained observer. Another book "Canada," by Beckles Willson, in the Romance of Empire series (Stokes), is full of adventure and atmosphere, and depends on no artificial methods for conveying fact. Two other volumes in this series are: "The Netherlands," by Mary MacGregor; and "Australia," by W. H. Lang. The three books are effectively illustrated, and are bound in striking covers.

For the moment Andrew Lang has abandoned fairies in various colored volumes; and his Christmas offering for children this year is "The Book of Princes and Princesses" (Longmans, Green, & Co.). The text is from the hand of Mrs. Lang, who has written some fifteen "true stories" out of "the old books of history." Among the heroes and heroines are Napoleon, the Princess Jeanne, and Princess Elizabeth. In the preface Mr. Lang explains that some true stories may be almost as interesting as fairy tales. The illustrations by H. J. Ford, eight of them in color, are in Mr. Ford's usual admirable manner. A condensation of Froissart's "Chronicles" for "younger readers of our history" (E. P. Dutton & Co.) has been handsomely illustrated in color by Herbert Cole. James Morgan's "Abraham Lincoln: The Boy and the Man" (Macmillan) is a biography, marked by the directness and unqualified enthusiasm of his "Theodore Roosevelt." "The Story-Life of Lincoln" (Winston), by Wayne Whipple, is a rather fragmentary compilation, designed to meet popular demand. "The Boyhood of Lincoln" (McClure) is told by Eleanor Atkinson; and an incident in his life is recorded by Margarita S. Gerry in "The Toy Shop" (Harper), but should one wish an excellent piece of fiction about Lincoln let him buy Mary S. Andrews's inspiring story of "The Perfect Tribute" (Scribner). Frederick A. Ober continues his series, Heroes of American History, in the lives of "John and Sebastian Cabot" and "Juan Ponce de Leon" (Harper); the author is painstaking and sometimes picturesque in his descriptions. Mary E. Phillips's "Laureled Leaders for Little Folks" (Lothrop, Lee) treats of Thomas Wentworth Higginson and Longfellow. C. H. Forbes-Lindsay's "Daniel Boone: Backwoodsman" (Lippincott) would be commendable as a biography, if it were not partly fiction; where there is a paucity of authentic data, the author feels compelled to invent. But Mr. Forbes-Lindsay has a picturesque style. For Dutton, Everett McNeil has combined narrative and fact for "In Texas with Davy Crockett." "Story-Lives of Great Composers" (Stokes), as viewed by Francis Jameson Rowbotham, is a thick volume dealing with seven musicians; at the end of each chapter is a list of important compositions. The text is illustrated with old-fashioned cuts.

In the field of fiction Marion Ames Taggart continues to be healthy and sentimental in "Six Girls Growing Older" (Wilde), a continuation; Annie Fellows Johnston has been forced to account for every breathing moment of her heroine, and "Mary Ware: The Little Colonel's Chum" (Page) is one of the moments. This is the ninth volume. The irritating fact about Mrs. Johnston is that she seems to have a certain power which could rise

above "The Little Colonel" as a trademark. "The New Boy" (Houghton) is one of Arthur Stanwood Pier's St. Timothy's Tales, with the usual athletics, and stereotyped characters. Ralph Henry Barbour's "Harry's Island" (Century), save that it is much too long, shows surprising ingenuity in invention; hut it is like what he has done before. A quasi-love story for girls, hy Enid Leigh Hunt (Lippincott), "The Advent of Arthur" is typically English; it forms one of five rather thick books published by Lippincott. There is "Life on the Ocean, or Twenty Years at Sea," heing the personal adventures of the author, George Little, introduced by W. Clark Russell; and Cutcliffe J. Hyne also contrihutes to the series. The Harper's Young People Series contains some good material, especially a story, "For Sale—A Warrior," in "Adventures with Indians," by Philip Verrill Mighels, and an interesting sketch, "The Buccaneers," in "Adventures of Pirates and Sea Rovers," by Howard Pyle. A third collection is called "Adventures at Sea." Two quaint little stories are Marguerite Bouvet's "Clotilde" (McClurg) and Mrs. M. E. M. Davis's "The Moons of Balhanca" (Houghton). The former is for older girls, and deals with New Orleans, when customs of France and Spain lent color to the social life; the estrangement between mother and daughter is deftly treated. The latter story contains more of the typical New Orleans atmosphere. Among the many tales of colonization, conquest, and pioneer adventure, we pick up Everett McNeil's "The Boy Forty-niners" (McClure) as a sample of five-cent literature toned down. Any newsboy would enjoy this narrative, however clumsy the writing. The book is not to be recommended for children who can get hetter, hut some librarians may welcome this story as a stepping-stone to higher things. Having met success with a former hook of like character, S. R. Crockett issues a second series of "Red Cap Tales" (Macmillan) based on four of Scott's novels. The connecting links are excellent, while the stories are told with spirit; the illustrations are rich in color. We helieve that a complete edition of Scott's novels, thoroughly illustrated, might sell almost as well as Henty.

As a fitting close we would record the Rev. Isaac Watts's "Divine and Moral Songs for Children" (Page), reissued in charming form; there is a lightness, a brightness of cover and illustration that offset the weighty injunctions of the verses. Mrs. Arthur Gaskins is the artist.

UNIVERSITY ADMINISTRATION.

University Administration. By Charles W. Eliot. Boston: Houghton Mifflin Co. $1.50 net.

This volume, which consists of six lectures delivered at Northwestern University, comes from the press at a fortunate time. The recent resignation of President Eliot has provoked a wide discussion of the man and his work. Various reasons have been assigned for his success. This is the authoritative statement. In the limits of an ordinary review an adequate outline of the book is impossible; for it is packed with matter. Here, then, we shall attempt nothing more than to discuss a few salient points.

President Eliot's theories of education are presented chiefly in the two chapters, "The Elective System" and "Methods of Instruction." At the present moment the elective system is being freshly attacked—a fact which lends peculiar interest to this summary of some forty years of experience with it. President Eliot is as uncompromising as ever in support of the principle. He believes that it is far more beneficial than the old required cirruculum; and that it is a peculiar advantage to the lowest quarter of a college class, because it "not only gets much more work out of that quarter, but also offers them their only chance of experiencing an intellectual awakening while in college." He tells us that three experts examined independently all the choices made by members of the classes of 1884 and 1885 at Harvard. The three men agreed upon only six cases in which the selections "lacked coherency and consecutiveness." "Two out of the three experts—but not the same two in every instance—agreed on twenty-one cases within the two classes." This, it must be admitted, is a very small amount of abuse to serve as a basis for wholesale condemnation of the system. President Eliot adds:

> This verdict would stand unchanged today, except that the recent gross exaggeration of athletic sports has added slightly to the number of incoherent or wrong-motived selections.

For the capable and ambitious student, the advantages of the elective system are, in our opinion, indisputable. We need not labor the point. The elective system is infinitely flexible and may be easily adapted to individual needs. Then, too, without it anything like advanced study in the branches for which a student has special aptitude would be impossible. And, on the moral side, as President Eliot has so often urged, the system throws the youth upon his own responsibility and serves to develop in him the feeling that his failure or success depends upon himself. This feature alone would compensate for many defects. The teacher, too, profits greatly; for the elective system affords him, as well as the undergraduate, a chance for advanced work; it helps to keep him from becoming a machine. To quote once more:

> The attention of faculties and the public has been too often concentrated on the effects of the elective system on young students; whereas its effect on teachers and on the development of real scholarship throughout the country, ought to receive more attention; for it is there that its effects have been most beneficent.

What, then, are the objections? The broad principle that underlies it we believe to be impregnable. There is not a college faculty in the United States that would attempt to prescribe a hard and fast curriculum for four years. The thing cannot be done. But the practical application of the principle is attended by many difficulties; and these, in our opinion, President Eliot has insufficiently emphasized. He assures us that the system "works well, wherever the administrative methods which should accompany such an elective system have been well devised and well executed." Elsewhere he remarks that "the main principle being settled once and for all, the administrative methods will be capable of indefinite improvement." Yet in neither of the two chapters we are now considering does he lay his finger firmly on certain of the troubles that have beset many institutions that are smaller and less fully equipped than Harvard. That college has been peculiarly fortunate in an unbroken administration through four decades, under a president who has had a definite policy which he has pursued with extraordinary tenacity. The result is that the Harvard curriculum has been developed with fair consistency and symmetry. Other colleges have had three or four presidents, some with one policy, some with another, and some with none. Under these unhappy conditions the most aggressive and pertinacious members of the faculty—often those with the lowest ideals of scholarship—have expanded their departments absurdly at the expense of the college as a whole. They have filled many pages of the catalogue with a dazzling array of courses that profess to be "advanced," but that are really nothing but a paper sham. These courses, valueless as they are for intellectual discipline, have depleted the really solid courses by attracting scores, perhaps hundreds, of students—some of the lads innocently imagining that the east wind is food for the mind, some deliberately seeking the easiest way to a degree. But on the strength of this fraud upon the college itself as well as the general public, ignorant and unprincipled teachers, pointing to their big classes, have secured the moral and financial support of the authorities, and have seriously cheapened the college degree. Were this the proper occasion, we could fortify our argument by citation of names and places, East and West—and so could every college professor who reads this article. Again, in the institutions where the aim has been to make an impressive exhibition of resources—a "window-dressing," to use the appropriate commercial phrase—the elective system has lent itself to the introduction of various new courses for which no adequate methods of instruction have been devised, and for some of which, we make bold to say, none ever can be devised. These evils

may not be inherent in the elective system, but at least they have been its inevitable accompaniment. Had they been more clearly recognized and guarded against, the elective system would stand in higher favor to-day.

President Eliot himself admits that an absolutely free and unrestricted choice of studies may have its drawbacks, and he is at pains to show that there are rather sharp limitations. The student cannot, for example, take advanced courses in any subject till he has mastered the elementary ones. But that restriction presupposes, as President Eliot puts it, "a well-ordered series of consecutive courses in each large subject of instruction"—a height to which many institutions have not yet attained. Furthermore, "in a well-managed college competent advice is always offered to the newcomer in planning his own schedule of studies." But the "freshman advisers" at Harvard, an innovation of the last twenty or twenty-five years, are a frank recognition of the fact that freshmen do not always choose wisely. Again:

> He [the student] cannot take two courses which occur in the time-tables at the same hour; and the time-tables may be systematically used to prevent unwise combinations of courses.

But if these restrictions are legitimate and useful, it cannot be argued *a priori* that others may not be; and certainly we have not yet experimented long enough and under sufficiently various conditions to reach a final conclusion. To the imposition of greater restrictions than these President Eliot, however, cannot see his way clear—at least at Harvard. The group system seems to him too rigid. Unless the boundaries of the groups are often transgressed, the boy whose aptitudes do not appear in his freshman year may be condemned to spend "several years in an ill-fitting group of studies." This is worse than choosing amiss "one or two studies which he can easily replace." Granting for the moment that at Harvard the present restrictions are severe enough, and that the results are as completely satisfactory as President Eliot believes them to be, we yet remain skeptical as to the case of institutions which cannot boast a thoroughly systematic scheme of courses and well-devised and well-executed methods of administration. There are colleges which have not yet worked out the adjustment of liberty and limitation. We have welcomed heartily the elective system—of which President Eliot has been the most powerful advocate—as an act of emancipation in the world of scholarship. But there, as sometimes in the larger world, emancipation has not been an unmixed good. For the next generation we must bend our energies to the practical application of the noble principle of freedom, and, if we may use the figure, to the complicated problems of educational reconstruction.

But the early introduction and development of the elective system would not have given Harvard such immense prestige and popularity had not the administration of the university been extraordinarily efficient. As an undergraduate President Eliot rowed in the crew and mastered the theory of applying every ounce of strength of every man to the production of a desired result. To that theory he has been unrelentingly faithful for forty years. Alumni, overseers, members of the corporation, teachers and other officers, undergraduates, and such outsiders as he could interest, have been enlisted in the one great enterprise of making the Harvard boat go, while he himself has, so to speak, pulled a magnificent stroke. It has been a wonderful exhibition of skilfully directed energy; and this book contains many *obiter dicta* showing how it is possible to appeal to one man's self-interest, to another's loyalty to the college, and to still another's devotion to science—all *ad majorem gloriam* Harvard. The vigor of the faculties, the administrative staff, and the governing boards President Eliot would maintain by a constant stream of young blood. He has been described as "the best judge of academic cattle in America"; he has picked out the finest stock while it was still young, and secured it at a bargain. This is a striking, even if unpleasant, way of stating an important truth. He has watched for promising graduates of Harvard; he has made it his business "to discover and make proposals to men still young who have distinguished themselves in the service of other institutions." He has tried to get the fullest possible return for his outlay:

> The larger institution does not need to offer such men full professorships. They can ordinarily be obtained for assistant professorships or even for instructorships without limit of time.

President Eliot has never hesitated to remind an aspirant for a place at Harvard that "to serve as an assistant to a successful professor in a university course is the best thing that a young scholar can do towards getting a good position for himself." President Eliot has also found that "it is often impossible for trustees to procure in the market the human article they need or think they need." But he has been too shrewd a Yankee to take the crudely commercial view which such phrases might suggest. He hastens to explain:

> Money is not the appropriate reward for the quick sympathy, genuine good will, patience, and comprehensive learning which go to the making of a first-rate university teacher.

Granted enough to live on and a pension system to provide "for the humane retirement of incumbents whose efficiency is impaired," the things which attract a professor are "long vacations, the gratification of his intellectual tastes, good fellowship in study, teaching, and research, plenty of books, . . . better schools for the children, a wholesomer life for the family, more social and educational advantages, and the general prestige of the inviting institution." In fine, one of the things which has imparted to Harvard its tremendous momentum has been the laborious, steady, and intelligent application of those broad principles of economy and efficiency in operation which make any industry profitable—but with due regard to the distinction between an industrial venture and an intellectual.

And, finally, the book is interesting as another revelation of one of the most impressive personalities in America. The orderly arrangement of the matter, the firmness and perfect lucidity of the style, the keen observation of men and affairs, the foresight, the worldly wisdom, in the high sense of that term, the forthright directness—these characteristics compel attention whether or not one is interested in problems of university management. Indeed, we may look upon this volume as an epitome, or record, of a life devoted to the service of Harvard, and, through Harvard, of the nation and the world—a devotion and a service for which the fitting reward is the gratitude and regard of thousands of men and women and the approval of conscience.

CURRENT FICTION.

The Whole Family: A Novel by Twelve Authors. New York: Harper & Bros.

This must have been good fun for everybody involved, though how it all came about is a question for the curious. We know, in a general way, who got together this company of strange bookfellows. Their joint performance was, we believe, the subject of a guessing-contest. But on what principle were they chosen? It is not easy to see why, if so-and-so is included, he or she is not. Did all the participants come willingly into the game, or were certain of them under some strange compulsion? One fancies Mr. James hypnotically persuaded to take his place in the circle between facetious Mr. Bangs and soulful Elizabeth Stuart Phelps, and caused to produce an excellent parody of himself, as if in spite of himself. It would be interesting to know, moreover, whether Mr. Howells simply set the ball rolling off-hand, or whether there was some sort of understanding as to what the general situation should be. And what determined the number of performers at twelve? Mark Twain included, it might have been called "A Baker's Dozen," and would still have been a Harper's. One supposes, however, that the possibility of exciting

this kind of curiosity might be one of the arguments for such an undertaking.

The result is sufficiently amusing, as occasional in its nature as a parlor charade. Mr. Howells leads off with a chapter so good that one fancies a superior "Kentons" might have developed if it had been for him to write the rest. The family is a representative "best family" of a Middle Western town. The father is a successful manufacturer, a self-made man, but (in Mr. Howells's hands) a person of intelligence and humor. After his kind, he is domestically inert and helpless in the hands of his women-folk, a puzzled though benignant spectator of their ways, individual and social. The mother is a person of dignity, locally supreme, neither intellectual nor a fool, unless in her easy-going subjection to her children. The rest of the group are: a resident grandmother, a transient old-maid aunt, married son and daughter with their respective spouses, a girl just out of college (co-educational), a school-girl, an urchin, and a friend of the family. The precipitating event is the engagement of the "co-ed" and a young professor of her college. And so out passes Mr. Howells in the middle of a sentence, with a mild glance of wonder at the gay figure which brushes by him and gains the middle of the stage. This is Miss Wilkins, who has conceived the old-maid aunt as a belated siren, and so plays her. And so in turn enter the rest, each with his monologue, ready and willing to expound or confound that slow course of events which ends with the linking of the girl with a mate whimsically provided at the eleventh chapter by Miss Brown, in the face of all suitors theretofore proposed. It is pure vaudeville, but many of the "turns" are characteristic and amusing; none more so than that of Mr. James, who holds the stage (if not the house) twice as long as most of the others, and, as he would say, gets beautifully nowhere.

Barry Gordon. By William Farquhar Payson. New York: The McClure Co.

When did the Gentleman of Old Virginia, with his Cavalier ancestors, his deep drinking and hard riding, his pride and his "chivalry," first come upon the stage of fiction? He must have been a welcome and picturesque figure, once, but now he lags superfluous, and it takes all the skill and charm of a Thomas Nelson Page or a Hopkinson Smith to put any life into his poor old bones. So amateurish a writer as Mr. Payson can awaken no belief in the reality either of the gallant Col. Gordon of Gordon's Raiders, who dies drinking to the Devil, or of his son, the hero of the book, who carries his Virginian virtues and vices through a stormy career of school and college scrapes and seven years' adventures in all parts of the world—including such little every-day incidents as going up, quite casually, in a Paris balloon and finding himself swimming for life in Lake Tchad—winding up with the rescue of his brother from the clutches of a second-hand Raisuli. In Morocco Mr. Payson seems rather more at home than at Harvard, on which he bestows a "campus" and a president who expels Barry, out of hand, for refusing to give the names of his companions in a freshman-sophomore rush.

The Altar Stairs. By G. B. Lancaster. New York: Doubleday, Page & Co.

The opening chapters of this book prepare us merely for a tale of breathless adventure, and as Rod Maclean sets out to corner the copra and timber trade of the Solomons, we hear with him only the insistent call of the sea. It is not long, however, before we find ourselves enlisted with him in more pregnant adventure in other and deeper waters. A human soul's discovery of itself and the laws of its being is always a theme of absorbing interest—interest in this case of a painful intensity, since Rod is no willing pilgrim, and is dragged passionately struggling from his City of Destruction. The grip of the story can in no way be conveyed by an outline of the plot, each incident being so firmly built into the general structure that the whole must be envisaged in detail to be appreciated. Among the dramatis personæ there are but few lay-figures; the majority are of startling vitality. Tony Heritage is decidedly the conventional villain, even to the setting of his eyes too close together, and one can but wish for a touch of the human relief Stevenson understood so well, in the too diabolic figure of Tuli. But Strickland, the missionary. "Little Mademoiselle," Leroit the dour engineer, and Hugo, have a genuine and compelling charm. It would seem as if there might be less wading in gore without sacrificing the sweep and vigor of the story; yet when one paints with so sure and broad a touch, it is perhaps unwise to quarrel with the superabundant red of his palette.

A Woman at Bay. (From the Italian "Una Donna.") By Sibilla Aleramo. New York: G. P. Putnam's Sons.

To the revolutionary women of our own race, chafing at political and economical inequality, this elemental cry from the Old World comes strangely. It is hard for an American woman, however she may pity the protagonist of the book, to sympathize with this morbid, "oversexed"—if we may coin such a word—passionately complaining creature; but the story of brutal physical tyranny and abuse, however hysterically told, is not negligible when we consider that it represents an actual condition of the present day, permitted—one might almost say enforced—by law. The novel-with-a-purpose rarely gives the delight that lies in true art; in this instance there has been no attempt to that end. It is the self-told life of a woman entrapped when but a child into a marriage whose increasing misery and degradation drive her to attempt suicide. After the birth of her son, she endures rather than be separated from him; but as his dawning consciousness begins to apprehend the horrible and irremediable discord of his surroundings, the mother is compelled to face a choice of sufferings:

> If I went, my boy would be orphaned; if I stayed it would be to set a degrading example before him throughout his entire life. He, too, would grow up in the midst of strife and madness.

She chooses to leave her son the memory of a mother willing to sacrifice even her own longing for him to the insistent call of what her spirit recognizes as right. The story leaves her supporting herself by teaching, her starved motherhood turning to the starved childhood of the sickly poor, hoping afresh for others, if not for herself.

It is practically impossible to judge from a translation the style of the original; in this case, however, that factor hardly enters, as the book is evidently intended rather for propaganda than for literature. Indeed, one can but feel that it is the writer herself who speaks in the closing pages: "I am not asking for fame but only to be heard."

Mirabeau and the French Revolution. By Fred Morrow Fling. In 3 vols. Vol. I.: The Youth of Mirabeau. New York: G. P. Putnam's Sons. $3.50 net.

Professor Fling's object is clearly stated in his preface:

> I have conceived my task in a large way and have striven to write the life of Mirabeau with an historical setting that will make it intelligible. I have endeavored to present Mirabeau as a true heir of the Riqueti, as a product of eighteenth-century France, but possessing a marked individuality and reacting upon his environment as a leader in the greatest revolution of modern times. In narrating his life I have tried to avoid the rôle of an advocate and to attain to a strictly scientific point of view. I have sought to describe his life as it actually was—in so far as the evidence permits it—but to describe it sympathetically.

It may be said at once that this aim has been signally realized in as far as that is possible in the first volume, which is characterized by a large and coherent plan, a mastery of voluminous material, a power of presenting characters in just relief against the background of the age, by moderation of judgment and detachment of view.

It is a singular fact that this is the first comprehensive and scholarly life of Mirabeau in English. Macaulay,

seventy-five years ago, wrote an essay on Mirabeau, with Mirabeau largely left out, in which he succeeded in characterizing him as a Wilkes-Chatham—a phrase as satisfactory as any for those who are content with labels. Carlyle, in his Olympian way, made Mirabeau the hero of his homily, and with a tremendous beating of the drums of rhetoric proclaimed him "world-compeller" and "Sovereign Man," leaving an impressionistic portrait, not an informing narrative. In recent years Von Holst has given us a suggestive study of his public career, and Willert an excellent but brief biography. Nor did Mirabeau fare much better at the hands of Continental scholars. For nearly a century after his death there was no adequate biography of the great tribune. This want was met twenty years ago by the almost simultaneous appearance of two works of great value: in French, that of Charles de Loménie in the last three volumes of "Les Mirabeau," and in German that of Prof. Alfred Stern. These have remained since 1889 the only important biographies of Mirabeau. Professor Fling's will, when completed, make the third; and if the excellence of the first volume is maintained, will fill an important gap.

The volume before us concerns mainly the youth of Mirabeau; that is, the first twenty-five years of his life, from 1749 to 1774, when he became legally of age only to be declared legally a minor by reason of his "imprévoyance vraiment enfantine." It is the fullest treatment of the subject that we possess from any expert, being more than twice as extensive as Loménie's and many times as extensive as Stern's. Nor does this treatment appear to be too ample. There is little that may be deemed superfluous, little that does not contribute to the enrichment of the narrative. Professor Fling's chief contribution to our knowledge lies in his elaborate and discriminating account of the relations of Mirabeau and his father. Hitherto those relations have been treated too much *en bloc*, as if they early became fixed and unchangeable. The result has been over-emphasis, lack of shading, a sense of unreality and unnaturalness. Professor Fling gives a truer and more convincing description of those relations, so portentous for both father and son, by showing, chronologically and at length, the vicissitudes through which they passed. His principal source of information is found in the correspondence that passed between Mirabeau's father and uncle, between the *marquis* and the *bailli*, a correspondence extensive, intimate, remarkably frank, remarkably vivid. This priceless material in twelve folio volumes of manuscript, preserved in Aix in Provence, has hitherto been used by Lucas de Montigny, the adopted son of Mirabeau, for his "Mémoires de Mirabeau," a work primarily of filial piety rather than of scholarship; and by Louis and Charles de Loménie in their five volumes on "Les Mirabeau." Professor Fling has made liberal extracts, has pieced them together skilfully, held them under rigid criticism, and has thus succeeded in presenting striking portraits of three salient Mirabeaus, father, son, and uncle. He has explained the growth of a strangely complex character. The exclamation of Jaurès is relevant even at this stage: "Quelle immense force organique était dans cet homme!" And the *bailli* wrote when the young man was twenty-one:

> If he is not worse than Nero, he will be better than Marcus Aurelius, for I have never encountered so much intelligence. It made my poor head spin. . . . The devil himself has not so much.

But the book contains far more than this. From its pages we get significant pictures of pre-revolutionary France. We see the Marquis de Mirabeau, *L'Ami des Hommes*, as riotous youth, as philosopher and reformer, and particularly as founder of a family, a "dynasty," as he called it—a plan zealously pursued for years, only to end in a tragic *débâcle*. Yet the author never loses sight of his main object, the evolution of a personality; but as he proceeds he throws many vivid side-lights upon the old régime.

Of the thoroughness of Professor Fling's investigations the work gives abundant proof. He has mastered his materials, both published and unpublished. At every step he is careful to cite authorities, and at the end he gives a critical and classified bibliography which is a model of its kind. He writes, too, in engaging temper. There is the most candid, even enthusiastic recognition of the contributions of other students of the subject. Professor Fling questions, accepts, and rejects the opinions of his co-laborers with entire independence of judgment and with entire friendliness. Whether he has, however, shown a good sense of proportion in assigning so much space to the first twenty-five years of Mirabeau's life, can be answered only on completion of his work. The style is marred by an occasional awkwardness of phrase and a translation at times too literal. As a whole, however, the English is clear and straightforward. The note at the bottom of page 153 contains some errors of dates.

Supplementary Papers of the American School of Classical Studies in Rome. Vol. II. New York: The Macmillan Co.

The American School in Rome has issued a second volume of its Supplementary Papers, for which there was no room in its usual medium for publication, the *Journal of Archæology*. A grant of the Carnegie Institution ($3,000), made it possible to illustrate the issue freely and well. Over half the space is occupied by A. W. Van Buren's transcription of the famous palimpsest of Cicero's "De Re Publica." When the Vatican Library was preparing its facsimile, it gave the school the privilege of issuing this transcription. The two publications supplement each other so thoroughly that neither is complete of itself. Mr. Van Buren in an introduction explains the peculiarities of the manuscript in the way of ligatures, abbreviations, syllabic divisions, and orthography. Obviously, it is a labor that will interest a small circle of specialists, and for them it will be of permanent value.

George H. Allen's article, "The Advancement of Officers in the Roman Army" also appeals to specialists, but in a wider sense, and it will be consulted by historians, as well as by classicists. It analyzes and tabulates the system of promotion followed by the Romans during the first three centuries of the Empire. Special branches of the service have been tabulated before, but this is the most thorough study of the army in all its branches. The elaborate system of offices in civil life, the *cursus honorum*, through which all Romans prominent in public life were obliged to pass, can now be paralleled by a corresponding *cursus honorum* of the army. One of the questions still left in obscurity is that of the variations which must have occurred in the system during the four centuries of the empire, through the reforms of such great military organizers as Trajan, Hadrian, and Septimius Severus; and also from other causes, such as the gradual withdrawal of both the native Italians and of the upper classes from military service, and the increased enrolment of barbarians. It would seem as if the study of the higher commands, up to the tribunes and prefects, might have been somewhat more complete. But, in general, the study is fundamental. It was based entirely on epigraphical evidence, as literary sources were practically useless.

Prof. J. C. Egbert's "Inscriptions of Rome and Central Italy" has a broader title than the contents really warrant, for the article treats of a few small groups studied by him during his year at the school in Rome—inscriptions of the Villa Tavazzi, near Rome, some of which are owned by the school itself, of Gabii, and of Capua and its vicinity. For the first time, the name of the famous early Roman goddess, Mater Matuta, is shown to appear in an inscription found in Rome itself. The Capuan group is the most interesting, especially, perhaps, the tombstone of the contractor of the Roman theatre at Capua, with a por-

trait of the builder, his hoisting machinery and workmen.

The fourth and last article in the volume, by C. D. Curtis, "Roman Monumental Arches," is attractive in theme and addressed to a wide audience, whom it takes over a considerable part of the Roman world in a description of monuments, both artistic and picturesque. After a discussion of the origin and different architectural forms of the so-called triumphal arches, Mr. Curtis gives a brief account of each example that either remains or had been accurately noted before destruction, seventy-nine in all. Mr. Curtis's explanation of the purpose of the arches is that they were merely free-standing bases for statues and otherwise had no use or purpose whatsoever. He theoretically excludes, therefore, all city gates, all entrances to temples and other enclosures, all cases where the arches are connected with other architectural units. In laying down these norms, he criticises previous writers who have included such monuments in their lists of arches. It is, therefore, surprising to find here the arch at Palmyra, which is part of a colonnaded avenue; those at Rimini, Trieste, and Adalia, which are city gates, connected with walls; those of Sbeitla and Medeina, which are entrances to enclosures; and those of Corinth and Khamissa, which are forum gateways. In Rome itself, the arch of Claudius was part of the arcades of an aqueduct, and the arch of Gallienus was a gate in the Servian wall. The distinction was, in reality, an illogical one and deserved to break down. Mr. Curtis also disregards his proposed exclusion of arches which were not accurately described before destruction or of which only little remains; for there is practically nothing exact known of the arch of Tiberius, the *arcus novus* of Diocletian, and the arch of Claudius in Rome, all of which he has included. As these arches in Rome itself are mentioned, it may be added that the author shows lack of discrimination, even here. He is in doubt whether the arch of Gallienus was originally single or triple, when not only the structure itself, but the great drawing of it, made by San Gallo before 1500, proves that it had three arcades. On the other hand, he is sure that the so-called arch of Drusus was originally triple and not single, on the basis of some blocks, which any architect would have told him were later insertions. From every point of view, the series should not be made to include, as arches, the *spina* of the circus of Vienne and a mausoleum at Celenderis. The most spectacular *quid pro quo* is calling the famous solid mausoleum of the Julii at S. Remy an arch, because it is crowned by a small arched canopy. The human and historic interest would have been greatly enhanced if the real meaning of the arches as civic monuments had been grasped and if greater familiarity with his theme had enabled the writer to triple or quadruple the number of arches described. Altogether, it must be confessed that the article contains no new material and makes no contribution to knowledge.

Science.

An Alabama Student and Other Biographical Essays. By William Osler. New York: Henry Frowde. $2 net.

No slight excellence in the purely medical writings of the present Regius professor of medicine at Oxford is the charming fashion in which he weaves historical allusion into a narrative otherwise plain and dull, and not the least of his many services is the stimulus he has given to the study of the historical side of medical questions. How effective this has been may be inferred from the numerous historical articles in the Bulletins of the Johns Hopkins Hospital and in other professional journals in recent years. Those who wish to know the method of this stimulation may learn it by studying this delightful book, which contains a baker's dozen of essays in biography prepared as occasional addresses before various societies. The main title is given by the story of the career of John Bassett, an obscure Southern practitioner, rescued from oblivion by the chance recognition of merit in a couple of contributions buried in a journal almost equally forgotten. Osler's interest in Bassett illustrates his view of biography; that it is not so much the enumeration of events as the estimate of conditions and results that counts. This, of course, may come close to preaching —in fact, at times one dimly discerns the shadow of a cassock beneath the professional gown—but it is a very good sort of preaching, concerning ideas and ideals of which the average medical student hears far too little.

Six of these essays deal with Americans: Bassett, Bartlett ("a peripatetic of peripatetics"), Beaumont (a model account of the first American physiologist), Holmes, Pepper, Stillé; and, incidentally, much is added to throw light on medical practice and instruction of the first half of the last century. It so happens, quite accidentally, that stress is laid upon the rejuvenation of medicine in this country by those exceptionally brilliant students who went to Paris in the third decade; in fact, another entire essay, a very charming one, is devoted to Louis and his influence on American medicine. Some day Professor Osler may find opportunity to estimate the influence of a later call of Europe which led no less brilliant, although perhaps less conspicuous, students, to sit at the feet of gifted German teachers and to bring back those methods of investigation in the laboratory which have done so much to put American medicine upon a proper foundation—a more potent influence than that of Louis and his school, we venture to think, because wider and deeper. Of these six essays the most complex is the remarkable appreciation of that really remarkable man, William Pepper. It would be interesting to know Dr. Pepper's opinion of the insight and discretion, not to say reserve, which Professor Osler shows here.

The rest of the book deals with older writers and brings much entertaining, sometimes curious, information. The least medical—on the whole the least satisfactory—is the essay on Keats, but it is amply redeemed by that on Sir Thomas Browne, read at a tercentennial celebration in England, in which the zeal of the biographer is almost outstripped by that of the bibliophile who had many editions to show. Bibliographical interests are also conspicuous, but less so, in the account of Fracastorius, the intellectual father of Syphilus, whose disease became a scourge. Seventeen pages are devoted to Thomas Dover and his extraordinary career as buccaneer and physician, burning many kinds of powder, one of which is familiar to posterity and bids fair to survive the competition of coal tar derivatives without number. Dover is interesting to posterity also as the rescuer of the original Robinson Crusoe, although some editors are rather less certain of Defoe's obligations to Alexander Selkirk. The essay on Locke brings out the medical side of his life and adds much to the work of other authors, being based on Osler's own examination of the Locke manuscripts in the British Museum and the record office.

In many respects the gem is the last essay of all, the Harveian oration of 1906, in which the writer undertakes to say something fresh on a topic which has been treated hundreds of times by his predecessors—and succeeds. Premising that the distinction of Harvey lies less "in the demonstration of the fact of the circulation" than "in the demonstration of the method," he proceeds to consider the discovery as illustrating certain aspects of the growth of truth. Here come out all the merits of Osler's method in biography. In nearly all the essays, there is abundant evidence of research, of the hunt for original sources (almost too briefly recorded for the benefit of the reader), and the careful use of them; but there is no musty odor, no rattling of dry bones, whether Osler goes back thirty or three hundred years. The reader feels that the author thoroughly understands the men of whom he writes and to an un-

usual degree is able to think their thoughts and appreciate their difficulties, so that biographical data are no longer mere dates and chronicles, but become living things, human experiences intelligible and appealing.

The "Surgical Memoirs" of Dr. J. G. Mumford (Moffat, Yard & Co.) is not concerned with the practical side of surgery as the conventional title would lead the reader to expect, but rather with its history. Almost exactly a third of the volume is a reprint from Keen's "System of Surgery," where it serves as an historical introduction in which the development of the art is given in what is often the barest outline, jumping gayly from Galen to Vesalius with a mere intimation of the existence of the Arabians and no mention at all of Salerno. The subject is considered in connection with seven great names (Hippocrates, about whom much is more mythical than the text admits, Galen, Vesalius, Paré, Von Haller, Hunter, Lister), with incidental mention of numerous others. A section devoted to American surgery gives the student a slight acquaintance with many worthies. The more important things in the rest of the book are two essays on surgical matters, one of them an entertaining summary of the "Teachings of the Old Surgeons," and five in biography, extended sketches of the careers of Cooper, Brodie, the elder J. C. Warren, Jacob Bigelow, and Samuel Howe. The story of Howe is told in a chapter whose title, "Boston Medicine One Hundred Years Ago and a Notable Physician of the Last Century," is quite misleading, for the reader will learn little of the medicine or its practice in 1807. The essay on Jacob Bigelow, not a surgeon, but a medical man of most varied interests, is exceedingly attractive, and appears to be much more the work of the author himself and less a facile compilation from standard sources. Taken as a whole, the book, well printed and enriched with a dozen good portraits, is written with too ready a pen, but is nevertheless pleasant reading and will be useful to many to whom a more scholarly work would be unwelcome.

The "Text Book of General Bacteriology," which Prof. E. O. Jordan has prepared (Philadelphia: W. B. Saunders Co.), rests on the assumption that the subject should find a place in every general scientific course, and fulfils the requirement well. Some of it is a little special for a general reader quite unfamiliar with the subject, but much of the book is easy and pleasant reading. The title is interpreted liberally; for the pathogenic protozoa, particularly the trypanosomes and the organism of malaria, are included. In short, the book deals with the micro-organisms of special interest to man, excluding, however, the higher forms, despite the importance of microscopical stages. The chapter on method is brief—in places almost too brief—it being held that the practice of the bacteriologist is to be learned in the laboratory. After a short account of classification follow chapters on the relation of bacteria to disease, and on immunity, very well treated. Later come the more important organisms with a brief account of the disease due to each, and some discussion of treatment, particularly of the specific treatment by antitoxic preparations. All this is well done, and, considering the space allowed, remarkably clear and intelligible, save that the clinical side of the subject is not quite so simple and easy, as the reader is often led to infer. The material is everywhere fresh and of the newest, not even that wandering human typhoid culture recently unmasked as the source of many cases being overlooked. In the tuberculosis question Jordan considers Koch's attitude, that bovine tuberculosis involves no danger to man, dangerously one-sided. In the matter of antitoxins, except for diphtheria, the statements are very conservative, being favorable to a protective vaccination for typhoid, and to Haffkine's inoculation for plague, but less so to Yersin's serum; finding the value of tetanus antitoxin to be chiefly prophylactic, and dubious as to Shiga's antidysenteric serum, which by one of the rare misprints is called a polivalent serum. There are also good chapters on the behavior of bacteria to milk, and concerning their rôle in tanning, in the curing of tobacco, and in other industries. The bacteriology of water is taken up in a particularly instructive fashion destructive to faith in filters as commonly used. A final chapter notes briefly the infectious diseases (smallpox, scarlet fever, mumps, yellow fever, and others), which are probably caused by micro-organisms not yet definitely determined. In each case the prevailing thories are briefly considered. Only for mumps and scarlatina does the discovery of the germ seem to be regarded as near at hand. There is no mention of any possible relation of micro-organisms to cancer.

In this day, in which so much attention is given to the abnormal, it might well repay some psychologist to make a study of the type of mind displayed by those who delight in writing books in which they profess to advance a given science, although quite unwilling to acquaint themselves with the work of their predecessors or contemporaries. "A Theory of Mind," by John Lewis March (Charles Scribner's Sons), and "Psychology of the Will," by James A. Ritchey (Broadway Publishing Co.), are excellent examples of works of this character. Dr. March apparently glories in the fact, mentioned in his preface, that "the preparation of the theory has been accomplished almost in solitude"; he thus accounts for the fact that he has "little to say in the way of special acknowledgment." Dr. Ritchey seems to be familiar with Noah Porter's "Human Intellect," but he offers little evidence that on the subject of his discourse he has read with understanding any works much more modern. It is significant that both of these authors are masters of arts and doctors of philosophy. Surely, men who have thus been honored should feel themselves bound by the responsibilities of men who have been highly trained. No "theory of mind" can be seriously considered which does not declare its relations, perhaps hostile, perhaps friendly, with the conceptions of the great modern psychologists. No "psychology of will" can be treated with respect which does not show an appreciative comprehension of the broad field of thought in relation to this subject which is open to any one who is within reach of our public libraries.

In "Electro Metallurgy" (D. Van Nostrand Co.), John B. B. Kershaw aims to give a brief and clear account of the application of electricity to metallurgy. The science and art of the subject dates from the experiments of Sir Humphrey Davy, who, in 1806-08, by means of a battery separated the metals sodium and potassium; and it received a great impetus by the invention of the Gramme dynamo in 1870. The progress in the art may be gauged by the increase in the output of products and the cheapening of price. The production of aluminum in 1889 was eighty-five tons; in 1906 it was 12,000 tons, and the price has fallen from $14 to fifty cents a pound. The production of calcium and carbide of calcium—the latter forming the basis of an acetylene gas industry—shows even greater progress; and a great range of new substances, among them carborundum, have been discovered which are revolutionizing the mechanical and chemical industries. The application of the dynamo to metallurgy has led to a great development of water power; and thus a country which is rich in this power is destined to pre-eminence in metallurgical industries. The future of Norway, Sweden, and Switzerland, for instance, in the direction of electrical industries is greater than that of Germany. The political economist will find this book very suggestive.

The committee in charge of the Sarah Berliner Research Fellowship for Women will offer, every two years, a fellowship of the value of twelve hundred dollars, available for study and research in physics, chemistry, or biology, in either America or Europe. Applicants must already hold the degree of doctor of philosophy, or be similarly equipped for the work. Application should be made before March 1 to the chairman of the committee, Mrs. Christine Ladd Franklin, Johns Hopkins University, Baltimore, from whom further details may be obtained. The donor of this fund, Emile Berliner of Washington, is one of the perfecters of the telephone and the inventor of the gramophone; he has also been of late years unremittingly active in the campaign for the prevention of tuberculosis.

The Academy of Natural Sciences of Philadelphia has conferred the Hayden Memorial Gold Medal for 1908 on John Mason Clarke, the State Geologist of New York, in recognition of his distinguished services to geological science.

There will be a notable gathering of scientists in Baltimore during the Christmas recess. The American Association for the Advancement of Science will meet December 28 to January 2; the American Health League, December 31; the Eastern Branch of the American Society of Zoologists, December 29-31; the American Society of Vertebrate Paleontologists, December 28-30; the Geological Society of America, December 29-31; the American Physiological Society, December 29. The American Society of Biological Chemists, the American Nature-Study Society, the Entomological Society of America, and other scientific bodies will also hold their sessions in Baltimore.

The next International Congress of Chemistry will be held in London from May 27 to June 2, 1909.

The senior astronomer of England, Andrew Graham, has just died in Cambridge

at the age of ninety-three. He was of Irish birth, and began his astronomical work in the late Col. Cooper's observatory at Markree, County Sligo. Afterwards he was the assistant at the Cambridge observatory, where he devoted himself chiefly to observing one of the zones of stars arranged for by the Astronomische Gesellschaft.

The death is also reported of a young astronomer of promise, C. C. Dolmage, who was graduated from Trinity College, Dublin, in 1893. His great work, "The Astronomy of To-day," was published only a few months ago.

Jean Albert Baudry, the French scientist, died November 27, at the age of eighty-one. He was educated at the College Stanislas. In 1853 he travelled in the Orient, and he then spent five years—1855 to 1860—in palæontological researches in Greece. He was made assistant naturalist at the Museum of Natural History, and in 1872 professor of palæontology in that institution. His works include "Recherches scientifiques en Orient," "Animaux fossiles et géologie de l'Attique," "Enchainement du monde animal dans les temps géologiques," and "Essai de paléontologie philosophique."

From Paris comes news of the death, at the age of sixty-six, of Dr. Ernest Hamy, for nearly forty years a laborious student of anthropology. With Quatrefages he classified and described "fossil man"; he organized the ethnographical museum of the Trocadéro, so rich in Americana, and, most of all, he stimulated students, museums, societies, congresses with his own unceasing activity. Since 1892 he had been professor of anthropology at the Muséum (Jardin des Plantes). Among his writings are: "Pièces de paléontologie humaine" (1878), "Cronica ethnica" (1880), "Origines du musée d'ethnographie" (1890), "Études historiques géographiques" (1890), and "La Galerie américaine du musée du Trocadéro" (1898). He leaves an extensive library and collection in the American section of his science, chiefly in South American documents; the fate of this collection will be watched with interest by many students who long ago recognized his admirable equipment for his work.

Drama.

"THE WINTER FEAST."

It is improbable that "The Winter Feast," the second in the cycle of plays written by Charles Rann Kennedy—"The Servant in the House" was the first—which was produced in the Savoy Theatre on Monday afternoon, will rival its predecessor in popularity, owing to its gloomy and unsympathetic character. But it is, nevertheless, a work of uncommon power, which will confirm the reputation of Mr. Kennedy as a dramatist of vigorous imagination, high artistic purpose, and rare technical skill. Considered as a piece of original dramatic invention, it is one of the most notable achievements of recent years.

The story is too complicated for any attempt at brief analysis here, but it may be described as a companion piece to "The Servant in the House," being a study in human ferocity as that was an essay on brotherly love. The scene is laid in the house of an old Viking, in Iceland, in the eleventh century, and the plot deals with the desolation, despair, and slaughter arising from a bit of cruel treachery committed twenty years before the first lifting of the curtain. Of the eight characters concerned, all perish except two, the original sinner and the evil spirit who, for vengeance, sets the machinery of suspicion, jealousy, and hatred in motion. The dexterity with which this machinery is handled, the adroit and logical way in which circumstances and character are made to act and react upon each other, the ingenuity displayed in bringing about the clash of conflicting passions, and the neatness with which the threads of a most complicated design are woven into the scheme of the final catastrophe, denote a master-workman. There is also a remarkable observance of the unities. The entire action proceeds from the one dominant motive, there is but one scene, and the supposed time of the play is no longer than the actual time of the performance. Moreover, it is to be noted that though the tale is one of slaughter, suicide, and broken hearts, all the deaths except one—about which there is nothing sensational—occur off the stage. The actual horrors are left to the imagination. In spite of this, the barbaric atmosphere, with its frank passions, its superstitions, its rude honor, its simple courtesies, and its hospitality, is well preserved. The dialogue, with its touch of the archaic, is studiously simple, but terse, forcible, and often eloquent. In several of the most critical scenes the quality is that of poetic tragedy. To sum up, this is a play of positive value, but the unrelieved and unduly prolonged gloom of it will militate against its success with the general public. It ought to be shortened by half an hour and played in much quicker time.

The acting is unequal. Miss Matthison gives a superb performance of a scorned woman. Arthur Lewis is exceedingly effective as a malevolent priest, and Walter Hampden does some capital work. Other characters are less happily cast.

Miss Fannie Ward will open her American engagement in Jerome K. Jerome's new comedy at the Park Theatre, Boston, January 4. The title of the play has been changed from "Fanny and the Servant Problem" to "A Servant Problem." Charles Cortwright will play the chief male character.

Miss Margaret Anglin is reported to have been very successful in Melbourne with her performance of Viola, in "Twelfth Night." Warm praise also is bestowed upon the Malvolio of George S. Titheradge. It is the expressed intention of Miss Anglin to appear as Katharine, Viola, and Beatrice in New York next autumn, after her production of "The Awakening of Helena Ritchie." The announcement is interesting, as she is one of the few younger actresses with whom high achievement in the poetic drama seems possible.

Music.

Piano Compositions. Johann Sebastian Bach. Vol. II. Boston: Oliver Ditson Co. $1.50.

Gottschalk Piano Compositions. Vol. I. Boston: Oliver Ditson Co.

Songs from the Operas, for Mezzo-soprano. Oliver Ditson Co. $1.50.

The Musicians' Library of the Oliver Ditson Co. already includes thirty-five volumes, all edited by specialists and printed in the clearest type, on strong glazed paper; and the books remain open at any page without having their backs broken. Lovers of the best in piano music will welcome particularly the second Bach volume, edited, like the first, by Ebenezer Prout, and including a selection from his larger compositions—chiefly suites, toccatas, fantasias, and fugues. Dr. Prout, an accomplished scholar, has been, since 1894, professor of music at the university of Dublin, and under his guidance it becomes easier to master and enjoy the Bachian polyphony. An introduction discusses the phrasing, notation, fingering, and the vexed question of the ornaments; there are also notes on the pieces selected. As regards the ornaments, the editor wisely accepts the theory that many of them were introduced to compensate for a want of sustaining power in the old instruments and therefore he excludes all which may not have been written by Bach himself. In playing these pieces on the improved modern instruments "too few ornaments are certainly better than too many." While some of the pieces in this volume are for the trained virtuoso only, amateurs can play not a few, especially the slow ones, which contain more of the essence of Bach's genius than the others. Some of them are almost startlingly modern; for example, the adagio on pp. 122-3, with its delightfully natural ending. But all of this music is a source of endless delight; it never palls, like the works of most other masters.

In startling contrast to this collection is the volume of selections from Gottschalk. In the sixties of the last century this pianist was for a time the rage. For his friends he played Beethoven or Mendelssohn, but at his public concerts he confined himself almost entirely to his own works. "There are plenty of pianists," he used to say, "who can play that music as well as I can, or better, but none of them can play

my music half so well as I can." He was born at New Orleans, his father being an Englishman, his mother a Creole of St. Domingan descent, and he was the first American musician to achieve distinction in Europe. Berlioz said of him:

> The boldness, brilliancy, and originality of his playing at once dazzle and astonish, and the charming simplicity with which he renders simple things seems to belong to another individuality, distinct from that which marks his thundering energy.

In this sentence Berlioz puts his finger on the three qualities needed for the proper interpretation of Gottschalk's piano music—brilliancy, simplicity, energy. William Arms Fisher, the well-known song-writer, who edits this volume, has chosen specimens of each of these styles, and his introduction supplies the information needed by those who would breathe the real Creole atmosphere of the Gottschalk music. It is not "high-toned" music, being mostly of the drawing-room order; yet an age which applauds Melba and Tetrazzini madly, ought to find much to entertain it in the florid music of Gottschalk.

H. E. Krehbiel has again displayed good judgment in his selections of operatic songs for mezzo-soprano. They range from Caccini in the seventeenth century to Massenet, who still launches an opera every other year. An erudite and helpful introduction comments on each of the songs chosen, forming, in fact, a miniature history of the opera in Italy, France, and Germany.

Massenet's operatic miracle play, "Le Jongleur de Notre Dame," which had its first European performance at Monte Carlo in 1902, was heard in America for the first time at the Manhattan Opera House last Friday. The libretto is based on one of the stories in Anatole France's "Étui de nacre," which in turn harks back to a mediæval legend. The story of a juggler, who has no way of attesting his faith except to execute his tricks in honor of Our Lady is calculated to bring out the best qualities of Massenet's genius. That genius, like Gounod's, hovers between two topics, frail femininity and religious ecstasy. In "Thais" the two are combined; in the "Jongleur" we have only the mystic ecstasies of the monastery, and those the composer expresses with a rare art of creating atmosphere and conjuring up the spirit—ecclesiastic and musical—of the fourteenth century. To give Mary Garden a chance to appear in this opera, M. Renaud (who impersonates in it, with his usual delightful art, the part of the monastery cook Boniface) persuaded Massenet to rewrite the part of the old juggler; and so skilful is Miss Garden in metamorphosing herself that the change must be pronounced an actual improvement. It is the best thing Miss Garden has done here, the combination of youthful reverence in her face with a certain degree of mischievousness being particularly fascinating. She is always a good actress and sometimes a good singer.

Art.

Little Books on Art. Enamels by Mrs. Nelson Dawson; Jewellery by Cyril Davenport; Miniatures by Cyril Davenport; Bookplates by Edward Almack. Chicago: A. C. McClurg & Co. $1 net, each.

The Arts and Crafts of Older Spain. By Leonard Williams. [The World of Art Series.] Three vols. Chicago: A. C. McClurg & Co.

Decorative art as a topic for popular study is losing nothing of its fascination; and the present year has seen the establishment of two useful series devoted to that subject. A large and thoroughly planned set of books to which we have devoted much space in these columns, the Connoisseur's Series, has brought into special notice the general editor, Cyril Davenport. He is also the author of two of the Little Books on Art, now before us. These are square books, only four and one-half by six inches, with many inserted plates and a few text cuts. The colored frontispieces, though specially announced, are not epoch-making productions; nor are the half-tones themselves of very great charm. They serve their purpose, however, of explaining the text.

In "Enamels," Mrs. Dawson shows familiarity with the different processes described, or many of them. There are seven principal chapters, of which, after an introduction, one is devoted to Cloisonné enamels, one to Champlevé enamels, and one to painted enamels; but then the logical order is broken, because Chapter v, instead of dealing with still another process, discusses Oriental enamels made by all the three methods named above. In like manner, Chapters vi and vii are devoted to Irish enamels and modern enamels, however made. This breach in logical sequence is a matter of regret, for nothing is more to be desired than a treatise which shall insist upon the unity of design and of processes between East and West, the middle ages and modern times. Careful readers will separate this book into two parts: a really useful treatise based upon the writer's own experience in the practice of the art; and that cursory examination of a few pieces in museums, to which Chapters v, vi, and vii are devoted. There is to be noted, moreover, an arbitrary omission of certain important branches of the enameller's art. On page 168, we are told, for example, that Cloisonné enamel on a porcelain ground "hardly comes within the scope of this book," though why this very common form is excluded is not explained. In short, the value of the book ceases with page 140, and the close of the discussion of European enamels.

The volume on Jewels in the Connoisseur's Series ignores the work of the ancients and of the men of the East. No such fault is to be found with Mr. Davenport's own volume, which is as general in its application, and as critical in its comparison of the habits of many nations and many times, as could be desired. This is, in fact, the typical book of the series. In an attempt to explain in one hundred and fifty small pages, the most important things in regard to personal jewelry, Mr. Davenport has been eminently successful. From these chapters, the most practised student of the subject could hardly fail to learn much that is new.

The same author's "Miniatures" is a sound explanation of this minute and delicate portrait painting. The subject is divided geographically: after a very brief introductory treatise on antiquity, English miniatures occupy Chapters ii, iii, and iv, and foreign miniatures are crowded into the twenty pages of Chapter v—all this to the exclusion of portraits painted in enamel, the Limousin and Petitot masterpieces, and all their kind, which are taken by themselves in Chapter vi. Wax miniatures are assigned eight pages in Chapter vii; but this subject has nothing to do with painting at all. An exhaustive treatise on these little-studied bas-reliefs would indeed be welcome to all students of the minor arts, and we may be glad to see even this slight and yet suggestive chapter. Another subject, remote enough from miniature painting, is touched upon in the pages which deal with the flat abstractions known as silhouettes. The author is evidently aware that the term miniature has nothing to do with small size, and yet he seems content to class under it all diminutive portraits, and nothing else. It is desirable that the title of his book should be changed so as to describe more exactly its contents.

Book plates are generally uninteresting to the student of art, for the bookplate which is a fine design is very rare; and the design which is significant and suggestive, is almost as uncommon. To seek for the two in one—to ask for bookplates, which are valuable from their association and meaning, and also as artistic designs—is to propose to one's self a search for almost impossible perfection. The reason is not far to seek. Bookplates came into fashion at a time when fine designing was a rarity, when the instinct for truth and charm in simple compositions had almost disappeared from Europe; and unfortunately for this branch of art, there were no examples in antiquity, nor any patterns to be taken from the

Orientals; and Europe—the inartistic and uncertain Europe of the eighteenth and nineteenth centuries—was left to itself to make such designs as seemed to it good. The results have been very unattractive. Collecting bookplates is an amusing occupation, but it must have a demoralizing effect upon the taste.

The larger and more pretentious work by Leonard Williams, aims to put into logical form what is known of the finer industrial arts of Spain. Volume I is wholly devoted to metal-work—jewelry, iron-work, bronzes, and arms; and we have only to regret that so little space has been assigned to the wrought balconies and screens which are so numerous in the peninsula. The choir-screens alone would suffice to fill a volume. But this is a small book of reference, not a folio of illustration. Volume II deals with furniture, ivories, pottery, and glass, and the one hundred pages and the thirty plates given to the pottery are well employed. More has been written about Spanish glazed and enamelled pottery than of all other Spanish arts together—but it is not easy to have too much of it. The glazed potteries, known as Hispano-Moresque, and as lustred wares, rank with the majolicas of Italy in artistic merit—in originality, if not in elaborate finish. In the chapters before us more space is allotted to more recent ware, the porcelains, as that of Buen-Retiro, and that of Moncloa, than is commonly allowed to those elaborate pieces; but the few paragraphs on the blue wares of Talavera are more valuable. Volume III takes up textiles, including embroidery, as well as lace and tapestry; and there are several appendices, and an index. The effect of Moorish design upon semi-Christian art is to be studied in Spain alone. The architecture of the Mudejar period has been presented, indeed, in the folios published by Uhde and Junghändel in recent times, as well as in the "Antigüedades de España," and other less trustworthy books; but it is hard to follow the traces of the style in the minor arts. Arms and armor show it in the very slightest fashion; and the armor of the royal collection is what foreigners study the most carefully, after the Moorish potteries. These volumes, then, serve as a suggestive and stimulating introduction to all these treasures of the peninsula; and, although the hard-working student would welcome more system, and a more analytic method, the book so arranged would be less popular. The publishers of all these books are to be congratulated and thanked upon these useful aids to the study of the finer and more graceful arts.

That there should have been two artists in the nineteenth century, each of considerable eminence, of identical name and surname, must frequently lead to confusion. It is therefore well to state that the Alfred Stevens whose drawings are reproduced in the latest issue of the Newnes-Scribner's Series of Drawings of the Great Masters is not the Belgian and Parisian painter of high-life, but the English painter and sculptor, whose best known work is the Wellington Monument in St. Paul's. In the drawings themselves we must confess to a certain disappointment. There is feeling for mass and for movement, and much vigor, especially in the slighter and more rapid sketches, and there is delicate workmanship in some of the decorative studies. It is the character of his female figures that puzzles, leaving one in doubt whether he drew too literally from a poor model or invented an ugly type to which he adhered. In contrast with their robust limbs, the small, flat waist and protruding abdomen of these figures are in either case disquieting.

In "Kunstgewerbe und Kultur," two volumes in Die Kultur series, Prof. Werner Sombart traces the evolution of the art industries of the past, and dwells upon the difficulties of the present day. He distinguishes between a struggle with capitalism and a struggle with the mechanical technique of modern times. Warmly referring to Ruskin as the champion of what now seems a lost cause, he admits that under the modern economic system and in the existing stage of artistic development a return to old processes of work and to previous ways of distribution would be impossible. "One must bear in mind the fact that at the time when artisans were artists art itself was hardly more than a trade."

An exceptionally fine specimen of bookmaking, both in letterpress and in illustrations, is the folio being published (Geneva: F. Boissannas & Cie.) under the patronage of King George I of Greece, entitled "En Grèce par monts et par vaux." The editors are Daniel Baud-Bovy and Frédéric Boissannas. The first instalment has just been issued, and the work, when complete, will contain chapters on Corfu, Athens, Zemenon, the ancient cities of Mycenæ, Argos and Tiryns, and the temples of Tegea, Bassæ, Olympia, and Patras. The archæological data are by George Nicole and the introduction is by Th. Homolle.

"Rosa Bonheur: sa vie, son œuvre" is an expensive memorial volume (50 francs—E. Flammarion) compiled by Anna Klumpke, the American friend and testamentary executor and legatee of the great woman painter.

H. Fierens-Gevaert, lecturer on the history of art at the University of Liège, publishes a quarto volume, with forty-four inset plates (12 frames—Van Oest, Brussels), on "Les Primitifs Flamands." There are to be four volumes, sold separately. This first number begins with the creators of Flemish art—Hubert and Jan Van Eyck, Roger Vander Weyden, the newly distinguished Maître de Flémalle, Pétrus Christus, and Thierry Bouts and sons. The reproductions (62) are from Belgium collections.

The British School of Archæology at Rome has continued its exploration in Sardinia during the past two months under Dr. Duncan Mackenzie. As before, special attention has been paid the *nuraghe* and the "tombs of the giants." Several previously unknown types were discovered and photographed and their ground plan reproduced. They show important resemblances to prehistoric sepulchral monuments in other parts of Western Europe.

The Pennsylvania Academy of the Fine Arts announces the foundation of the Carol H. Beck Memorial Gold Medal, to be awarded annually to the best portrait in its annual exhibition, painted within three years of the time of its exhibition by an American artist. The medal is endowed by the Hon. James M. Beck, as a memorial to his sister, Miss Carol H. Beck, a portrait painter, who died October 15, 1908. The Beck Medal will be awarded for the first time from the 104th annual exhibition of the Pennsylvania Academy, which will be held from January 31 to March 14. The committees of the exhibition are as follows:

Painting—Hugh H. Breckenridge, Adolph E. Borie, 3d, Paul Dougherty, Thomas Eakins, W. Sergeant Kendall, L. H. Meakin, Gari Melchers, William M. Paxton, Edward F. Rook, Edmund C. Tarbell, Everett L. Warner.

Sculpture—Charles Grafly, H. A. MacNeil, A. Phimister Proctor.

Hanging—Hugh H. Breckenridge, Paul Dougherty, William M. Paxton.

The Common Council of Florence has voted to celebrate the semi-centennial of the Tuscan revolution of 1859, "not with empty festivities and mere commercial speculation, but with the creation of an institution of great civic and artistic importance"—to quote the words of the motion. The city, dissatisfied with its Galleria Moderna, proposes to found a permanent gallery of modern art, native and foreign. It is expected that the government will permit the modern collection now in the Belle Arte to form the nucleus of the new gallery, which will be placed in the Palazzina in the Cascine and opened to the public next spring. The Common Council has also voted to support the plan, already announced, for an exhibition of portraits in Florence in 1911. It will be limited to five or six hundred canvases, painted between the end of the sixteenth century and 1861, the year of the proclamation of the kingdom of Italy. As a part of the city's memorial of the events of 1861, the changes necessary to reopen Or San Michele and the Logge of Leon Battista Alberti will be made, and a marble reproduction of Michael Angelo's David will be placed in the position once occupied by the original in front of the Palazzo Vecchio.

Dr. Pietro d'Achiardi has been commissioned to complete the rearrangement of the Vatican gallery, which had been interrupted by the death of Prof. Ludwig Seitz. Dr. d'Achiardi is thoroughly competent for the work, as he has been intimately connected with the gallery in his position of scientific adviser to Professor Seitz.

Among the exhibitions at the dealers' galleries in this city are early Dutch and Flemish pictures at Ehrich's; miniatures by Charles Turrell at Scott & Fowles's; paintings by Charles Melville Dewey at Macbeth's, till December 10; oils and water-colors by Herbert W. Faulkner, Powell's, December 14; Sir L. Alma Tadema's Caracalla and Geta, Arthur Tooth & Sons, December 31.

Alfred Paris, an artist who has exhibited at the Salon since 1886, has just died

at Fontainebleau at the age of sixty-one. He studied under Édouard Detaille, whose style he followed. He illustrated a number of books, including Halévy's "Recits de Guerre," published by Goupil.

Finance.

LOW MONEY RATES AND THE GREAT BORROWERS.

The present month opened with demand loans in Wall Street at about 1 per cent., and rates for three months' loans on stock collateral, below 3 per cent. For December, these are unusual figures. This month is normally a period of active money and falling bank reserves, when currency flows in the largest volume of the year into the channels of hand-to-hand circulation, and when the credit facilities of great banking institutions, here and abroad, are strained to provide simultaneously for the heavy commercial trade and for the large fiscal operations which mark the so-called "turn of the year." How exceptionally low these present rates for money are, may be judged by the fact that in December, 1907, call money on the New York market touched 25 per cent.; in 1906, 29; 1905, 125; 1904 (when trade reaction and abundant bank reserves had been, as in the present year, the order of the day), 5; 1903, 9; 1902, 12; 1901, 12; 1900, 6½; 1899, 186; 1898, 6; and 1897, 5½. It is possible, no doubt, that the money market, later in the present month, will reach higher figures than this week's; but the rate for call money has nevertheless been lower than in any December since 1896, and that for time money lower than in this month of any year since 1898. On nearly all the larger foreign money markets, the case is similar.

Low rates for money, an indication of idle capital, would on their face suggest the probability of free use of credit, both in speculation and in promotion of enterprise. The first result has certainly been witnessed. The Stock Exchange, for a week or more, has been deserted by the outside investing public because of high prices, but nevertheless, the quotations have been so jacked up by professional speculators that, in a score of active shares, the record prices of the year have been attained since the public was driven out. At the same time, powerful borrowers have appeared with applications for new capital.

When the bids for $12,500,000 in New York city bonds were opened on Monday of last week, it was found that the total applied for was $157,000,000. This oversubscription caused frequent inquiry in banking circles, as to why the railways do not at once take advantage of so favorable an opportunity for raising large sums. Industrial corporations seem to be doing so; the American Telephone Company has this week offered $50,000,000 bonds, and the United States Rubber Company $20,000,000. It was the railways, however, of which James J. Hill declared, in 1906, that $1,100,000,000 new capital for improvements every year, for the five ensuing years, was absolutely indispensable. Two weeks ago, the Illinois Central sold bonds to the amount of $20,000,000; last week the Erie applied for authority to issue $30,000,000, and the Denver and Rio Grande negotiated a sale of $17,500,000; but in all three cases the primary object was to pay off floating debts. There has been no important sale of bonds by railways since last June, when the Union Pacific brought out its $50,000,000 first and refunding 4s. During the eighteen months preceding the Union Pacific issue, the roads, in most cases, could raise money only through short term high interest bearing notes. Why do they not come into the market now?

The floating debts of a pressing nature have now been pretty generally extinguished. But this brings up a matter concerning which much was said in 1906—the problem of additions and improvements, lack of provision for which was then declared to be throttling industry. Are the railways to do nothing in that direction now, and if so, why? Two important railway officers have lately answered the question. In his annual report of last October, President Ripley of the Atchison said:

> The recession of business found your company engaged in extensive construction and improvement work, some of which was so far advanced that it could not be suspended without great loss. Such work therefore was vigorously pushed and substantially completed. Other construction and improvement work, although highly desirable from the standpoint of economy of operation and good service to the public, was suspended and will not be taken up again until conditions improve.

When asked, last week, if there would not now be a rapid increase on the part of the railroads in orders for materials, James J. Hill replied:

> Conditions are improving undoubtedly, but we [the Great Northern Railway] have fifty locomotives stored away which have never had steam in them. Until they are put in use, I do not think that we will place orders for new ones.

That Mr. Hill's explanation of the case does not apply to one railway only, was sufficiently proved by a recent Railway Association report on the car supply. In the middle of November, idle cars were 300,000 less in number than in the middle of April, but 109,500 nevertheless remained sidetracked, whereas, exactly a year before, the supply was 44,800 short of immediate requirements.

Yet even these explanations leave the questions open: first, whether the railways will not once more enter the money market on an enormous scale if trade activity does return to normal and idle cars are all in use; second, what effect such a new demand for capital would produce on the market.

"King Cotton," by James L. Watkins (New York: Published by the author), adds another reference book to the already long list of those annually published for the benefit of the cotton trade. But here an effort has been made to give more than the usual compilations and statistics of crops, prices, exports, etc. The author has gone exhaustively into the history of cotton in each of the cotton States.

PUBLISH THIS WEEK:

The Fresh-Water Aquarium
AND ITS INHABITANTS.

A Guide for the Amateur Aquarist, by OTTO EGGELING and FREDERICK EHRENBERG. With 100 illustrations, large 12mo, $2 *net*. By mail, $2.19.

This volume gives clear and complete instructions to the amateur. It describes, and illustrates by some of the finest photographs ever taken from life, the great variety of plants, fishes, turtles, frogs, and insects that may be kept indoors in health and contentment. It furnishes information concerning food, treatment in health and sickness, methods of capture and handling, and what aquatic creatures will or will not live in peace together.

NOTEWORTHY GIFT BOOKS

Lagerlof's Christ Legends
By the author of "The Wonderful Adventures of Nils." Translated by VELMA SWANSTON HOWARD. Beautifully bound and decorated by BERTHA STUART. 16mo. Boxed, $1.25 *net*. By mail, $1.36.

The Carolyn Wells Year Book
Illustrated by Mmes. LEONARD and STUART and Messrs. HERFORD, DE FORNARO and STROTHMANN, with weekly engagement blanks. Boxed, $1.25 *net*. By mail, $1.35.

LIBRARY RESEARCH
Topics of all kinds and in any language looked up in the Boston and Harvard libraries for scholars, writers, and others. Abstracts, copies, translations, and bibliographies made. Proof-reading and revision of manuscript. Highest university and library references.
MISS M. H. BUCKINGHAM,
96 Chestnut Street, Boston, Mass.

IN OLD CEYLON
By REGINALD FARRER, author of "The Garden of Asia," etc. With 16 Full-page Illustrations. 8vo. pp. xii-351. $4.00.

The book has little concern with modern Ceylon, its industries and exports; it tells rather of the bygone glories and sanctities of ancient Lanka, when the island was the seat of a powerful monarchy and a dominant church.

The interest of the book is not wholly antiquarian and historic, for Ceylon is a vast flowering garden of whose blossoms and paradises all votaries of horticulture will delight to read.

LONGMANS, GREEN, & CO., New York

MILTON AS A SCHOOLMASTER
John Milton was born in London in 1608, just three centuries ago, his birthday being December 9. One interesting and useful recognition of the ter-centenary, which will be valued especially by our teachers, is the publication by the directors of the Old South work in Boston, as one of their large series of Old South Leaflets, of Milton's famous little treatise on Education, most remarkable for its time.

The Great Fight

Poems and Sketches

By WILLIAM HENRY DRUMMOND, Author of "The Habitant," "The Voyageur," "Johnny Courteau," etc. Edited, with a Biographical Sketch, by MAY HARVEY DRUMMOND. Illustrated by FREDERICK SIMPSON COBURN.

POPULAR EDITION: *With 8 Full-page Illustrations. Crown 8vo.* **$1.25** *net.*

PHOTOGRAVURE EDITION: *8vo. With 9 Illustrations in Photogravure. Bound in Quarter Calf, gilt top, in a box.* **$2.50** *net.*

MEMORIAL EDITION: *With 9 Photogravure Illustrations. Bound in Quarter Calf. Limited to 100 Copies.* **$5.00** *net.*

This volume brings together the poems and sketches which had remained unpublished at the time of Dr. Drummond's death. The collection has been made by Mrs. Drummond, who has provided the book with a preface containing some illuminating comments upon the poems, and with a brief and very interesting account of Dr. Drummond's life.

Romance of Roman Villas

By ELIZABETH W. CHAMPNEY, Author of "Romance of Italian Villas," "Romance of the French Abbeys." *8vo. With 9 Photogravure, 1 Colored, and 44 other Illustrations. $3.50 net.*

"A delightful blending of history, art, and romance. Many of the stories are thrilling and none the less exciting because they belong to history."—*The Chicago Dial.*

"Fully carries out the suggestion of Guizot, 'If you are fond of romance, read history.' "—*Boston Transcript.*

The Greatness and Decline of Rome

By GUGLIELMO FERRERO. Translated by ALFRED E. ZIMMERN, M.A., Fellow and Tutor of New College, Oxford.

Vol. III. The Fall of an Aristocracy. Vol. IV. Rome and Egypt. *2 Volumes, 8vo. Each,* $2.50 *net.*

PREVIOUSLY ISSUED: **Vol. I. Imperialism and the Republic. Vol. II. Julius Cæsar.**

"If the scheme is completed as worthily as it has been begun, Signor Ferrero will have written a more living, a more actual history of Rome than any that has yet been produced. . . . The book is one that can only be put down reluctantly and with a sense of gratitude to the author."—*The Academy.*

Blackstick Papers

By LADY RITCHIE. *Crown 8vo. Illustrated. Probable price, $1.75 net.*

A collection of essays by Lady Ritchie, a daughter of Thackeray, dealing with men and books and other matters, written with the grace and charm which characterized her famous father's "Roundabout Papers."

The Heart of a Geisha

By MRS. HUGH FRASER. With a frontispiece in Color by LUDWIG HOLBERG and Ornamental Borders and Decorations by R. WEIR CROUCH. *8vo. Beautifully printed and bound. $2.00.*

A romantic story of Japan, particularly noteworthy for its interesting account of Geisha life. The description of the dance by which the Geisha saved the life of her lover, a young noble attached to the cause of the Mikado in the days preceding his triumph over the Shogun, when such devotion meant imminent danger to one's life and liberty, is a remarkable bit of description, and forms the climax to a very dramatic tale.

The Lincoln Centennial Medal

A Volume presenting the famous Roine Medal, together with the most noteworthy and characteristic utterances of Abraham Lincoln.

Bronze Edition: *Crown 8vo, with the medal in bronze, 2½ inches in diameter, mounted artistically on boards, bound in buckram,* $5.00 *net.*

Silver Edition: *8vo, with the medal reproduced in silver, artistically mounted on boards, bound in full leather. Limited to 100 signed and numbered copies.* $12.00 *net.*

On the 12th of February, 1909, the dies of the medal are to be cancelled, and then deposited in the collection of the American Numismatic Society. After that date no more copies of the medal or of the book containing the medal can be produced.

Mirabeau and the French Revolution

By FRED MORROW FLING, Ph.D., of the University of Nebraska. *To be in Three Parts. Each 8vo. Illustrated. $3.50 net.*

Part I. The Youth of Mirabeau. *Ready.*

Part II. The Opponent of Arbitrary Government. *In Preparation.*

Part III. The Defender of Constitutional Monarchy *In Preparation.*

No full and scholarly biography of Mirabeau has appeared in English, and hence the *raison d'être* for the present work. This first volume is devoted to the youth of Mirabeau, and closes with the year 1774, when he legally came of age.

Mirabeau's career is full of the most startling dramatic incidents connected with his own love affairs and the extraordinary adventures of his private life, and also with his acts as a public man during the Revolution.

The House Dignified

Its Design, Arrangement and Decoration. By L. H. FRENCH. *Very fully illustrated. Large 8vo. Ornamental Cover, $5.00 net.*

Miss French's book brings out the correct and guiding principles that should be in the mind of all who are building houses, great or small—principles that underlie designs, arrangement, and decoration. The volume is both a mine of general information and an invaluable miscellany of detailed practical hints and suggestions. The illustrations are particularly fine.

A Canyon Voyage

The Narrative of the Second Powell Expedition down the Green-Colorado River from Wyoming and the Explorations on Land in the Years 1871 and 1872.

By FREDERICK S. DELLENBAUGH, Artist and Assistant Topographer of the Expedition. Author of "Romance of the Colorado River," "Breaking the Wilderness," etc.

8vo. With 50 Full-page Illustrations from Photographs and from Drawings by the Author (2 in colors) and Maps, including Reproductions of the first maps made. $3.50 *net.*

Mr. Dellenbaugh's scientific training, his long experience in this region, and his eye for natural scenery enable him to make this account most graphic and interesting.

The Niagara River

By ARCHER BUTLER HULBERT, Professor of American History, Marietta College. Author of "The Ohio River," "Historic Highways of America," etc. *Large 8vo. 70 illustrations. $3.50 net.*

In this volume, with its profuse and beautiful illustrations, Prof. Hulbert tells us all that is best worth recording of the history of the river; and an immense amount of carefully ordered information is here brought together in a most entertaining and informing book.

At Large

By ARTHUR CHRISTOPHER BENSON. *Crown 8vo. $1.50 net.* Uniform with "The Altar Fire."

In the essay, Mr. Benson is at his best, and here he is in his best vein. An atmosphere of rest and tranquil thoughtfulness envelops the reader as he peruses this book, so full of sage reflection, humor, shrewd observation and serviceable thought; so fluent, accurate, and beautiful in style; so pleasingly varied in cadence.

PREVIOUSLY ISSUED: **The Upton Letters, From a College Window, Beside Still Waters, The Altar Fire, The Schoolmaster.**

A Commentary

By JOHN GALSWORTHY. Uniform with "The Country House." *Crown 8vo. $1.50.*

"A book full of true ideas about life, told in Mr. Galsworthy's characteristic manner. He seems to buttonhole the reader and command his attention until he has finished. He does not deal in half measures, he says what he feels from the bottom of his heart. . . . Always clever and thoughtful."—*The Daily News.*

PREVIOUSLY ISSUED: **The Country House, The Island Pharisees, Villa Rhein, The Man of Property.**

The Nation.

NEW YORK, THURSDAY, DECEMBER 10, 1908.

The Week.

The President's message has one piquant and almost sensational passage in which Mr. Roosevelt accuses Congress of wishing to prevent him from investigating "criminals in the legislative branch." But aside from that, his last address to Congress is decidedly routine and perfunctory. As he says, "this Administration is ending." He is done with the job. He evidently expects little or nothing from this expiring Congress, in the way of carrying out his recommendations, and the probabilities are strong that he will not be disappointed. In the long passage on law, the Constitution, the courts, and the functions and duties of judges, Mr. Roosevelt says many things that are obviously true but in general he seems unable to conceive of a law, or a principle, which sometimes works temporary and incidental harm, but which is such a proved embodiment of liberty any justice that it cannot be hastily set aside. All his tests are personal. He has no large and enduring standards by which to judge particular cases. To him, the law is a nose of wax, to be shaped according to the desire or whim of the hour. In the section devoted to the condition of the Treasury he would apparently avoid the hard facts; he groups figures for the past seven years—the time since he became President—shows that there has been, during that period, a net Treasury surplus of nearly $100,000,000, and calls this "an exceedingly satisfactory showing." If Mr. Roosevelt had looked back only seven months instead of seven years, he would have had to record a deficit of more than $78,000,000 in that brief time. If he had taken the last fiscal year with the part of the present one already elapsed, he would have had to confess a deficit of nearly $120,000,000. He is at least consistent, however, in not saying one word about economy, the duty of Congress to keep down expenditures, or the need of carefully studying the public revenue. Lavish to the last, he takes pride in the fact that the "nation has never hesitated," during his Presidency, "to undertake any expenditure that it regarded as necessary."

Mr. Taft's speech to the North Carolina Society in this city Monday evening revealed again the admirable temper of the man. He was earnest, frank, sincere, desirous to end unhappy and illogical conditions in the South. His utterances were in line with his previous references to the subject in the campaign, and even prior to that, and should have a far-reaching effect in the South. There the number of people who vote the Democratic ticket while hoping for Republican success is increasing; and everywhere there is a striving for a release from the political impotence to which the South is reduced. On the negro question, which is at the bottom of the trouble, Mr. Taft touched bravely enough. Expatriation of the negro is, as he pointed out, impossible, and so is the repeal of the Fifteenth Amendment. On neither of these proposals need anybody waste a breath. The negro must remain, if only because the South cannot do without his labor, and that labor ought to be thoroughly educated to be effective. The hope and the opportunity for the great mass of the negroes, he urged, must be in skilled artisanship and in farming. As for the bugaboo of social equality, Mr. Taft showed that it cannot be created by law or by anything the Federal government could do. Equality of opportunity, equality before the law, at the ballot-box, and in the pursuit of life, liberty, and happiness—these alone are the Constitutional guarantees.

This is, as we have more than once argued, perhaps the best reason for opposing discriminating laws against the negroes. Public opinion can regulate social intercourse; in the long run, laws never can. In advanced and well-regulated communities the enforcement of racial differences by the degradation of one element in the community smacks as much of barbarism as does the setting apart of the Jews in Russian cities, and brings with it similarly the temptation to kill and destroy. It is a confession that the much-vaunted superiority of the one race cannot be maintained except by giving it exceptional opportunities, comforts, and privileges. Against this idea Mr. Taft, the jurist, has plainly set his face. He demands, especially, equality at the ballot-box. Not that he is opposed to laws imposing educational qualifications; but he would have both races subjected to the same test. Upon that footing the negro, we are confident, would be happy. But now, by terrorism, actual or implied, by cheating, by lying, and deceit, the educated, wealth-producing negro is denied his vote in a thousand communities. These wrongs will never be righted until some leader like Mr. Taft is absolutely frank on this point.

The report that Congressman Burton will be Secretary of the Treasury in Mr. Taft's Cabinet has elicited nothing but praise, so far as Mr. Burton's fitness is concerned. He is one of our steadiest and best-trained public men, who has made a special study of finance, and whose convictions and courage are of the soundest. But in all this ointment there is one disagreeable fly. Mr. Burton has announced his candidacy for the Senate. His preference and the natural crowning of his career would be to succeed Foraker. But that place is wanted for and by Charles P. Taft. Boss Cox of Cincinnati, whom William H. Taft denounced, is for Charles Taft; and the mention of Mr. Burton for the Cabinet looks unpleasantly like a scheme to remove a rival. If C. P. Taft were not a very rich man, and the brother of the President-elect, nobody would think of him as a Senatorial possibility. Mr. Burton is immeasurably his superior. If Ohio is going virtuously to retire Foraker, the field ought to be left open to something besides money-bags. Nor do we see how C. P. Taft in the Senate could be anything but an embarrassment to President Taft. The latter, far from aiding his brother's ambition by taking a much better man out of his path, ought to call upon fraternal affection to make one more sacrifice, and avoid a contest which would surely make a bad impression.

Speaker Cannon's defence of the rules of the House is strong, on general grounds. We have little sympathy with the outcry against the rules, as such.

A firm regulation of procedure is confessedly necessary; and some man, or group of men, must prevent the flood of proposed legislation from swamping the House. Bills simply must be sent to powerful committees, and some one in authority must decide which measures shall be called up, and when. Otherwise, we should have, not an orderly House, but chaos. The present rules are a slow growth. They have gone on strengthening the power of the Speaker under Mr. Carlisle and Mr. Crisp, as well as under Mr. Reed and Mr. Cannon. The process, as a whole, was inevitable. In the House of Commons a parallel evolution has occurred. Control of time and of legislation has been made more rigid. There is no getting away from that. But the real objection to Speaker Cannon lies not in the system which he administers, but the way in which he has administered it. He has been narrow and dense, where he should have taken broad views and been more awake to legislative needs. Such power as he has is necessary, but it is also necessary that it be used more wisely. The real argument is not for better rules, but for a better Speaker.

The Post Office Department's suggested reorganization of its administration in urban zones, coming so soon after the transfer of fourth-class postmasters to the classified list, will make the political jobber think that he is being hunted in earnest. In the New York city district the significance of the change would appear in strongest light. Were our postmaster to manage all the territory lying within the twenty-mile circle, New Jersey and Westchester County Congressmen would lose a host of useful friends overnight, though the public might get a cheaper and better service. Those who are interested in preserving this valuable patronage will, of course, have no difficulty in turning State's rights to account against the reform. But few people to-day can work themselves into a fit of terror over the thought that an official on Manhattan Island is distributing Newark letters. The proved success of centralization in the Boston postal district should outweigh many objections.

It is quite impossible to tell which is the more pitiful, the little Republican bosses' cheap impudence with regard to Gov. Hughes, or their hopeless lack of humor. Last Friday's conference at the Republican Club in this city was as unblushing a bit of political marketing as we remember for many a day. The little bosses let it be known that they look upon the head of the ticket elected in November as no man of theirs. The others—the Lieutenant-Governor, the Comptroller, the State Treasurer, the State Engineer—the bosses own, and these worthies have solemnly pledged themselves to delegate into Timothy L. Woodruff's hands the appointive powers vested in them by the State Constitution. Nothing more shameless can be conceived than the authorized phrasing of the formal jobbing contract, that Mr. Woodruff is to be "the clearing-house man through whom all appointments are to be made to the State departments of"—everybody except the Governor. Of him "those present at the conference to-day are to make no requests for appointments." We know how it is. In every happy family there is bound to be a black sheep who simply has to be cast off to assure the comfortable existence of the rest; some gambler, horse-thief, or forger. That's Gov. Hughes.

Mr. Gompers is beginning to find one reason why he could not deliver the labor vote. Somebody else was delivering the offices. President Roosevelt's appointment of a third labor leader, whom he was able to detach from Gompers, was made public last week—the editor of the *Labor World* of Pittsburgh, who is to be Appraiser of the Port in that city. The local Congressmen were not consulted, and neither were the Pennsylvania Senators, so that there is muttering in Washington over this irregularity. That may be left to itself; the chief import of the matter is in the light it throws upon Mr. Roosevelt's methods and upon the nature of labor leaders. The moral is that, in the labor world, as elsewhere, the east wind cannot compete with good official salaries.

Whether or not one agrees in full with Moorfield Storey's indictment of our government of the Philippines, the fact remains that we are densely ignorant of what is going on in our provinces. What American citizen knows of the successful career of the first Philippine Legislature, its altogether excellent record? Vice-Governor Forbes returns from the islands, and says that everything is progressing magnificently, and that all is well, only we must continue indefinitely to rule the Filipinos against their will. Whereupon we slap each other on the back, exclaim over the greatness of our ability as colonial administrators, and promptly forget about the archipelago for another six months. If Mr. Storey or any one else complains that the swindler who professed to make gold out of sea-water is an honored member of the teaching force in the Philippines, he is written down a bore. Our touching faith in the ability of our ruling officials to pass upon their own achievements would be sublime if it were not pathetic. It is partly due to the fact that we have no effective Opposition in Congress and are debarred from questioning Ministers as to this or that occurrence on the other side of the globe. There is little or no fear of criticism or restraint. All of this merely illustrates anew how unfit our form of government is for ruling subjugated peoples.

Ambassador Takahira happily describes the nature of the agreement between his government and that of the United States. He calls it simply "a transaction between trusted friends." The text of the notes exchanged bears out this characterization. The wording ingeniously avoids the form of a treaty. There are no promises; no binding obligations are assumed; what we have is merely a statement of facts. "It is the wish of the two governments"; their "policy is directed"; they "are firmly resolved"; and, in case of any disturbance in the Orient, "it remains for the two governments to communicate with each other in order to arrive at an understanding as to what measures they may consider it useful to take." A lawyer, to be sure, might pick the agreement to pieces and show that it contains not a single clause by which either country could be held. But it is not a question of a legal contract. A friendly understanding is all that we have in hand; and to a diplomatic document of that kind the old saying applies with especial point: "C'est le ton qui fait la chanson."

The strength of our position in the Far East gains from the fact that we

are now the friend both of Japan and of China. Peking is said to be discontented with the vague terms of our recent agreement with Japan. It finds therein no effective guarantees against Japanese aggression in Manchuria, carried on under more or less legal guise. But it was natural that the Chinese should be somewhat discontented with that very lack of precise obligation which is the chief merit of our understanding with Japan. To have entered into detail regarding China or any other subject under consideration, would have come dangerously near to formulating a treaty, instead of expressing a condition of mutual accord. The fact remains that only a few days after our exchange of notes with Japan, a Chinese ambassador has visited the White House to thank the President for our generous conduct in the matter of the Boxer indemnity. The President's order in that case constitutes one of the most meritorious acts of his Administration, and has had its reward in the sharp change of feeling it has brought about in China since the days of the anti-American boycott, three years ago.

Twelve dead and three hundred and fifty hurt—that is the best summary of football casualties available for the season just ended. Four of the dead were members of college elevens, those of the Virginia Military Institute, the University of North Carolina, the University of Arkansas, and Utah Agricultural College. The larger colleges had their usual roll of disabled players, but, as usual, the higher percentage of injuries was in the minor teams, such as those of high schools and normal schools. In view of the figures, it cannot be said that there has been any great diminution in the risk run by the participants. On the other hand, owing to better supervision by the officials, there has been a gratifying improvement in the bearing of the players. But there is still room for revision of rules, as there is a distinct drift back from open play to line-bucking. But the strongest arguments against the continuance of intercollegiate contests under present conditions are not to be found in the fact that the casualties have been as heavy this year as in the season of 1905—casualties which led to the "opening up" of the game. They lie, as before, in the distraction of the student from his studies, and the overemphasis upon the importance of the contests, and athletics generally. By hard work professionalism has been eliminated; brawny truck drivers are no longer induced to take a course in the veterinary department during a football season; graduate students and freshmen have been excluded from any university teams. For these reforms the college world is duly thankful; but the musty professors still regret that their students do not get down to work until the "championship" is settled. President Eliot's words of two years ago are still unanswerable:

> Both at school and at college the popular competitive sports now take away the time and interest of the players from physical exercise which can be combined with intellectual exercises, such as country excursions on foot, visits to industries, or field study of any of the different forms of natural history. The American secondary schools have distinctly lost ground within the last twenty years; because the afternoons are so generally devoted throughout the year to competitive games of ball, and the boys' daily conversation runs on the games, instead of on their reading, their walks, or the sights and sounds of real life in city or country. The same distractions have impaired the intellectual quality of college life.

A hint that Prime Minister Asquith might dissolve Parliament and appeal to the country was dropped by Mr. Lloyd-George last Saturday, but probably it was scarcely more than a mild threat intended to keep the discouraged Liberal majority in line. It is by no means sure that a general election at the present moment would mean a Conservative victory. The bye-elections have been going against the government, but so bye-elections in England usually do. The Liberal majority is still so enormous that the party can lose heavily and remain in power. On their side the Liberals have the active resentment of many people against the patently provocative attitude of the House of Lords. To-day that feeling might be strong enough to send the Liberals back to power with a mandate to reform the upper chamber. But in two years the soreness may be allayed, and the Liberal party may have to stand the taunt of having done little but take the cash of public office while letting the credit of fruitful legislation and public support go. But parties are, after all, made up of individuals; and these will, as a rule, balance personal interest against the general party welfare. The tremendous sweep of January, 1906, landed in the House of Commons scores of more or less humble persons who under ordinary circumstances can never hope to see Westminster again, even if the Liberals should succeed in retaining power. And the pressure exerted by such members, who have much to lose and little to gain, may be sufficient to make Mr. Asquith hang on. Yet it requires resolution to lie still in impotence under an increasingly galling fire; for we may be sure that the Conservatives in the House will not be slow in baiting a government whose chances of enacting desired legislation is inversely proportioned to the size of its majority.

The German and French budgets have been recently compared by a French financial expert to the disparagement of his own country. Jules Roche, who, it is true, has long been a bitter critic of French government finance, maintains that all this talk about Germany groaning under an unparalleled burden of taxation is foolish. Chancellor Von Bülow is quite right in asking for more revenue. The Germans can stand it. By taking the total of the revenues for the Empire and the separate States, and subtracting the income derived from the railways, telegraphs, forests, mines, and other forms of productive state industry, he finds that, in 1907-08, 60,000,000 Germans paid 3,900,000,000 francs in taxes, while 40,000,000 Frenchmen paid 3,050,000,000 francs, giving a per capital taxation of 65 francs for Germany and 76 francs for France. M. Roche holds, further, that France has reached the limit of her sources of revenue, while Germany has still a wide margin to draw upon. The double system of German finance makes the best comparisons liable to error. If we take Prussia alone, with a population some two millions less than France, we find that in 1906-07, according to the "Statesman's Year-Book," the revenue for Prussian and Imperial uses was about 3,270,000,000 francs, which would turn the per capita taxation in favor of France. But, after all, the chief point to be made is that France *does* manage to get on with her budget, while Germany goes on eating borrowed capital and now faces an accumulated deficit of $500,000,000.

"DRESS GOODS, YARNS, AND TOPS."

78 Chauncy Street, Boston.
July 10, 1897.

My Dear Mr. North: I am unable to go to Washington and have no one to look out for my interests there but yourself, and I depend upon you. Of course, Messrs. Aldrich and Dingley will do all they can, but I depend upon your letting them know what I need. I depend upon you. Dress goods, yarns, and tops.

Yours very truly,
WILLIAM WHITMAN.

This is one of those interesting letters between Mr. Whitman, president of the Arlington Mills at Lawrence, Mass., and S. N. D. North—then secretary of the National Association of Wool Manufacturers, now Director of the Census—showing by what tricks a tariff bill is framed. The correspondence was presented at the hearings of the Committee on Ways and Means. Mr. Whitman is an old hand at lobbying. When cross-examined on this subject during the trial of a case in Boston in 1902 he admitted that he had been at Washington more or less looking after tariff legislation. At first he denied that he had ever been paid for his services, but later he explained:

Why, much to my surprise, there was somewhere about 1883, I think it was in 1883, a few gentlemen got together and made up a small purse to help me, and gave it to me.

But Mr. Whitman found a better way when the Dingley bill was being concocted in 1897. Senator Aldrich kindly invited Mr. North to serve as one of the clerks of the Finance Committee, while in the pay of the Association of Wool Manufacturers. "I am the only person whom the committee allows at its meetings," wrote Mr. North in a letter to Mr. Whitman April 4. Mr. North felt that these "confidential relations" would not allow him to keep Mr. Whitman so fully posted as he might like, but he added:

If I find that it is desirable that you should come on here, I will telegraph you that the situation requires attention, and you will doubtless have no trouble in finding out what is the matter.

For all practical purposes, of course, this was as good as direct information, and nothing in Mr. North's labored and wholly ineffectual letter of explanation alters the fact that he was present at the sessions of the committee as a sort of secret agent or spy, and that the wool manufacturers thus enjoyed an important advantage, both potential and actual, over other persons who might be interested in these schedules. Mr. North, of course, did nothing illegal. And he was properly rewarded; for, as he himself puts it, the officers of the Association, in "recognition of the arduous and responsible work" which he had performed for the committee, "apart from" his "duties as secretary of the association," presented him with the sum of $5,000.

We wish each of our readers might get hold of the pamphlet in which the letters between Mr. Whitman and Mr. North are published. There could be no plainer exhibition of that greed which makes and is made by a protective tariff. We quote a few passages:

Boston, April 6, 1897.

I depend upon you to look out for my interest in this regard. You know how important it is, not only to me, but to the whole worsted industry of the United States. . . . If there is the slightest danger of any change, I must see these gentlemen before it is too late. . . .

WM. WHITMAN.
Boston, June 2, 1897.

We all depend upon you to watch closely our interests, to see that nothing is overlooked or neglected by our friends on the committee. I have no doubt they will do all they can do, but with so many interests to look after, our special representative must see to it that our interest receives proper attention. . . .

WM. WHITMAN.
Boston, June 9, 1897.

Bear in mind that I am depending upon you wholly to look after my interests. . . .

WM. WHITMAN.
Washington, D. C., June 10, 1897.

I will do the best I can with Mr. Allison when the time comes, but he knows nothing about the understanding I have with Aldrich on the worsted yarn schedule. . . .

S. N. D. NORTH.
Washington, June 20, 1897.

It is lucky I was here, and just in the position I am. It has given me a whole day to work on the matter and get it right, and with Aldrich away, there is no one on the committee who knows anything about it. But Allison and Platt trust me, and I expect they will both agree to what I have asked. I went all over the matter with them last evening.

S. N. D. NORTH.

Our readers will agree that if Mr. North was willing to do this kind of thing, $5,000 was small enough pay for it. But we are less concerned with this particular piece of infamy than with the view it gives of a tariff bill in the making. The wool manufacturers landed the superserviceable North in a clerkship; but other interests were, as Mr. Whitman observed, well looked after. One owned a Senator, another a Representative, and so on through the whole list. At the committee hearings last week, Andrew J. Solis, a Boston dealer in wool, declared that the "top-makers"—Mr. Whitman is one of them—procured a protection of 150 per cent.; but other parties were grabbing for their share, and got it. Representative Boutell of Illinois expressed considerable surprise and horror at these revelations of intrigue, and professed a desire to go to the bottom of the matter and get all the facts. We should advise him, however, to stay his hand. Were the drag-net cast in earnest, bigger fish than the unhappy North would be caught. In a thoroughgoing investigation we should learn what manufacturers subscribed to the Republican campaign fund of 1896, and who solicited the funds; what were the secret understandings with the leaders, and with less important individuals in the Grand Old Party; who looked after the steel schedules, who after the oil, and all the rest; what Cannon's special duties were—Aldrich's seem fairly well known—what Dalzell's and Payne's, and all the other zealous "standpatters"; exactly what they did and why they did it. Then we should uncover a scandal compared with which the looting of the insurance companies, the Credit Mobilier affair, and the operations of the Whiskey Ring were nothing. Then Mr. Roosevelt might discover that there is a moral question in the tariff issue. Then every man who had eyes to see or ears to hear would know that our tariff laws are shapen in iniquity and conceived in sin.

THE NEW CIVIL-SERVICE ORDER.

Mr. Roosevelt has imitated previous Presidents in extending the provisions of the Civil Service Law just prior to his retirement from office, but none of his predecessors ever took a more important step than Mr. Roosevelt's of last week, and none was entitled to warmer thanks from the country. Under this new order, every fourth-class post office east of the Mississippi and north of the Ohio is brought under the civil-service rules. The present incumbents will, of course, be undisturbed; but as they die or resign or are removed, their places will be filled only by men who have passed an examination. No less than 15,488 of the 55,318 fourth-class postmasterships are affected, and it is probable that as soon as these have been classified the number will be increased.

This epoch-making reform has a dou-

ble significance. It is not only that the Executive is thus deprived of a large amount of patronage, and that the assault has begun upon one of the last strongholds of the spoilsman, but that the 15,488 postmasters thus included in the rules will have to give up, once and for all, any partisan political activity. There is little doubt that, except in some few cases, the classified Federal employees were not permitted to take an active part in the campaign just closed. The fourth-class postmasters were, however, as heretofore, the special agents of the party machine. The rôle played by the Southern postmasters in nominating Mr. Taft under Mr. Hitchcock's skilful guidance everybody remembers. From time immemorial the village postmaster has been the chief local dependence of the party in power. Often the only Federal employee in his town, he has used his office to the full. In district, county, and State conventions he has been very prominent, and as a delegate has made it easy for a man like Senator Platt to retain his grip on the machine. Henceforth, if other Executives are as earnest in keeping Federal employees of the classified service out of active politics as Mr. Roosevelt has been, the political effect of his last order will be far-reaching. There will still be too many unclassified Federal office-holders in politics for safety, but the gain when all the fourth-class postmasters are excluded will be enormous.

Undoubtedly, the geographical lines drawn by the President will lay him open to the charge that he was careful to overlook the Southern postmasters for use in future conventions. This criticism we believe to be unjust. It must be remembered that the first step of the reform of the civil service came along curious geographical lines, and apparently discriminated in favor of certain departments. To have included all the fourth-class postmasters at once would have been a tremendous undertaking. It will be no easy matter to draw up satisfactory examination-papers, and the difficulty of holding examinations in the vast rural stretches of the West and South must be borne in mind. Again, in the South the ever-present race problem must be considered. While it is highly desirable that the bogus Republican organizations in the South should be deprived of their postmaster props as speedily as possible, we believe the President did well to go slowly.

That the competitive classified service has made vast strides under Mr. Roosevelt admits of no question. When he became President in 1901, 108,967 out of 235,766 civil employees were within the rules, a growth from 14,000 in the eighteen years following the passage of the Pendleton law in 1883. On June 30 of this year, out of a total of 352,104, there were within the classified portion 206,637, exclusive of 5,500 laborers who are under the rules though not subject to examination. With the President's new order, there will be altogether 227,625 practically protected from removal during good behavior. This is an increase from 46 per cent. of the whole service in 1901 to 64 in 1908, and this despite a great enlargement of the total number of employees. To Mr. Roosevelt belongs also the credit of bringing under the rules the rural free-delivery carriers, 40,000 strong; the Forestry service; part of the Isthmian Canal force; deputy collectors, deputy naval officers, and cashiers; the finance clerks and cashiers in post offices; and the field clerical service of the War Department (withdrawn by Mr. McKinley). The labor service in Washington and the principal cities, while not subject to examination, may properly be put in the same list. Moreover, Mr. Roosevelt has introduced the system of examination and limited competition in the consular service. As our readers know, he has from time to time made very bad individual appointments. That is his unfortunate method of being "practical"—doing wrong at times in order to accomplish what he thinks good. But on the credit side must be placed the fact that by including deputy collectors of customs, he has placed higher officials under the rules than any other President; and he has rigidly enforced the prohibition against political assessments in all cases laid before him. He is thus entitled to the hearty praise of every advocate of civil service reform.

Should he desire to go still further before leaving Washington, he could classify the employees of non-free-delivery post offices, the 4,500 pension-examining surgeons, and the assistant postmasters. Yet he may wish to leave something for his successor to do. Mr. Taft, it is a satisfaction to know, is fully as ardent an advocate of a protected civil service. For years he was president of the Cincinnati Civil Service Reform League, and he introduced the reform idea into the Philippines as soon as he reached there.

SCIENCE CORRECTING SCIENCE.

Frenchmen are making preparations to erect a statue to Homer. Only a few years ago the idea would have met with the sharp objection that Homer never lived, or, if he did, that we know nothing about him. But even a few years ago it would have been possible to retort that the Athenians did not hesitate to erect an altar to the Unknown God, and that the principle might hold for an unknown poet who is revealed to us in his works. To-day, however, we can assume an even stronger position. Homer is being rescued from the limbo to which Wolff and Lachmann consigned him, and is being set upon his feet again as a real, if somewhat indefinite, personality. This procedure has stirred a French man of letters, André Beaunier, to a pæan of rejoicing in a recent number of *La Revue de Paris*. M. Beaunier, while still a child, had met Homer. The poet was in a dust-covered picture—an old man in a long robe, carrying a lyre on his back, his right arm raised to heaven, his left leaning on the shoulder of a boy who was his guide; for the singer was blind. Young Beaunier's father told him that the man was Homer, a great poet of olden days, and the son of the river Meles and the nymph Critheis.

How long did the child's belief last? Till he began his first year at the *lycée*. Up to that time Homer was not only a real person whose parents were the river Meles and the nymph Critheis, but he was the creator of a world of realities. Briseis, on whose account Achilles mingled his bitter tears with the loud-sounding Ægean, and Nausicaa playing ball with her hand-maidens on the Phæacian beach, were as real as his own girl cousins, only much more lovable. But the first week at high-school brought ruin into the boy's world. The professor of philosophy assured him that the visible universe did not really exist, that it was all a mere subjective image or "idea"; and the professor of ancient languages was sure that Homer never lived, that the poet was only a collection of folk-songs. The

destruction of the visible universe the boy could have borne with equanimity, but the disappearance of Homer shook the foundations of his being. Wolff, Lachmann, Schlegel, and Jacob Grimm were so many anarchs to him. Hence we can appreciate how M. Beaunier found joy in *their* overthrow in turn and in the reëstablishment of his ancient faith in Homer, whose father was the river Meles and whose mother was the nymph Critheis.

Something of the same joy enters into most of us when some pet "triumph" of science receives what the man in the street calls a black eye. It is not so much the joy of getting back an ancient belief which Science has superciliously waved away—"Myth!" "Legend!" "Superstition!"—as to have science convicted of falsely professing omniscience. Philologian and biologist have sinned alike in destroying without reason, and, worse still, in building without adequate foundation. It may be that Agassiz could, from a thigh-bone, reconstruct an entire brontosaurus. But, after all, that is no more than the ancients could do when they reconstructed Hercules from his foot. What is not to be denied is that more than one scientist has from a thigh-bone built an animal the like of which was never seen on land or sea, and for which he has had to invent a Greek name; and more than one archæologist has taken a couple of inscribed bricks and upon that frail basis erected a complete extinct civilization that never flourished. To believe in Homer and Moses because a vast literature and tradition centre about them is superstition. To refuse to believe that Pharaoh was the Egyptian Knuft-Ra, who lived either 2500 B. C. or 6700 B. C., it is not quite certain which, is equally superstitious. Jacob never served fourteen years for the sake of Rachel. Rachel was only a lamb and the totem of a Bedouin tribe.

At present we are swinging away from a science that seems almost as apt to go to extremes as mediæval scholasticism was. The tyranny of the scientist and the scholar is so heavy upon us that when scientists fall out the ordinary man is shocked to observe the limitations of their knowledge. It is painful, for instance, to be told that recent archæological discoveries in Turkestan may necessitate the reconstruction of the theories of Indo-Germanic philology. Now, Indo-Germanic philology, to those of us who have heard of it, is as firmly established as the Copernican system itself, or the law of gravitation. Have not the histories of great nations been written in accordance with what Indo-Germanic philology had to teach? Have not tremendous theories of race supremacy, of Aryan versus non-Aryan, been founded upon the philologian's discoveries? Have not political parties, anti-Semites, Pan-Germanists, Pan-Slavists, and what not, been based in turn upon such theories of race supremacy? And have not Dreyfus campaigns, and Kishenev massacres been brought about in turn by such racial parties? Their champions have not hesitated to call the teachings of Indo-Germanic philology to their aid. Yet an expedition goes out to Turkestan and the root principles of Indo-Germanic philology may have to be seriously modified.

Arguing against science at the present day would be acting like the farmer who saw an elephant for the first time and declared that he didn't believe there was such a beast. But to protest against the exaggerated claims of the scientists is not only legitimate, but useful. For it is certain that reaction will otherwise carry us to the opposite extreme of mysticism, spiritualism, and plain charlatanry. Bumptious fighting about electrons and ions will make an opening for the discovery of "psychomeres" or soul-atoms. Evolution itself is growing more modest, as it should. Twenty years ago the extreme Darwinians could easily have told us why women have long hair. Primitive marriage was always marriage by capture. The long-haired women could be easily seized and dragged away in the forest. The short-haired women failed to get husbands, and in the course of time died out. But nowadays we should look twice at such an explanation.

SOME SWEDISH BOOKS OF THE YEAR.

To see themselves as others see them has always been the peculiar privilege of Americans. Charity workers and university professors, politicians, and tourists from all countries of Europe pay longer or shorter visits to this country, and publish more or less comprehensive reports. Two such accounts have been printed in Sweden within the present year. Prof. Rudolf Kjellén of the University of Gothenburg accompanied the Swedish student singers on their American trip in 1904. The letters which he sent home, together with similar material, have now been issued in book form under the title "Sångare- och turistfärder" (Stockholm: H. Geber). The thirty-four days which the author spent in Pullman cars, hotels, and concert halls naturally did not suffice for a close study; but as long as he is concerned with the mere surface of things he is a keen enough observer. Very amusing, for instance, is his description of the American woman as he saw her on the streets of New York and Chicago—"a dazzling revelation . . . like a sailing ship, half swan and half chicken; . . . under the most extravagant of hats the hair bulges out over the forehead in a tremendous crown, and under it gleams a bird face on the most glorious pedestal." The entrance from the sea to New York Professor Kjellén thinks can be well compared with that to Stockholm and to Constantinople. An observer of different kind, with a definite purpose, is Harald Salomon, who in his "Om barndomstolar" (Stockholm: P. A. Norstedt & söner) tells of his experience during a journey of several months from the Atlantic to the Pacific. He attended juvenile courts, accompanied probation officers on their visits, and talked with judges and officers in New York, Washington, Chicago, Denver, Salt Lake City, San Francisco, Los Angeles, Indianapolis, Pittsburgh, and Philadelphia. He brings home to his readers a clear idea of one of the greatest forces for good in this country. A summary view of the systems of treating juvenile delinquents in other countries follows, and then a critical study of the Swedish plan.

"Natur och arbetsliv" (Stockholm: Norstedt) is a book descriptive of Sweden, by Anna Sandström. The first volume, now before us, deals with the southern part of the country. Though principally intended for young people, it is far from being a juvenile in the hackneyed sense; it presents in an interesting manner the natural features of the land and the occupations of its people in field, mine, and factory. The illustrations are excellent. Among the calendars which Almqvist & Wiksell, Upsala, are bringing out for the Academy of Science in Stockholm two deserve special mention: "Svenska kalendern," a "book of reference for everybody," containing all sorts of statistical and other information, mainly relating to Sweden; and "Svenska resekalendern," of which the first volume, which appeared this year, contains descriptions and plans of every city and borough in the country, together with other matter of especial interest to tourists.

The publication of Alfred Jensen's "Rysk kulturhistoria" (Stockholm:

Aktiebolaget Ljus) is a sign of the times, in that it indicates the increasing interest Sweden feels in its eastern neighbor. Translations of Russian novels have always had a vogue in Sweden, but Russian history and politics have, singularly enough, not aroused much attention until the last few years. It is only twenty years ago that Prof. Harald Hjärne's "Från Moskva till Petersburg" was discontinued for lack of subscribers, after the publication of only two parts. Professor Jensen, a life-long student of Russian and other Slavic languages and literatures, is the author of several works on travel in eastern and southern Europe, of a book on modern Russian literature, and of translations from Russian and Polish poetry. He visited Russia during tbe eventful year 1905 and described his experiences in an interesting volume, "Tsardömet vid skiljovägen." His new work, of which two volumes have been issued this present year and of which a third is expected soon, is a study of Russian civilization from literary documents, of civilization in its struggle against official and unofficial barbarism. In a number of more or less loosely connected essays the author shows the trend of intellectual and political development in Russia from the times of the Nestor Chronicle to those of the freemasons and freethinkers at the beginning of the nineteenth century. Writers like Vladimir Monomach, Krizjanitz, Kantemir, Lomonosov, Derzjavin, Radistjev, he passes in review, as well as the unknown authors of popular songs and tales, and he discusses their works as the expressions of the prevailing tendencies of their time.

The celebration of the sixtieth birthday of Professor Hjärne was marked by the appearance of two volumes: one of essays by tbe professor himself; the other a collection of monographs presented to him by a number of his former students, now engaged in historical research. His own volume, "Svenskt och främmande" (Stockholm: Geber), is made up of matter written at different times during the last twenty years. Five of the essays, without forming a connected series, present a study of Sweden as a European Power during the century from the reign of Gustavus Adolphus to the fall of Charles the Twelfth. In the essay on Charles the Twelfth the author suggests as a desirable undertaking a coöperative history of the times of this king. The contribution of his pupils, "Historiska studier tillägnade Harald Hjärne" (Upsala: Almqvist & Wiksell), is a stout volume of over 800 pages, containing twenty-seven papers by as many writers, and a "Hjärne-bibliografi," by A. Grape. The introductory paper, by Johannes Kolmodin, tells of "Early Swedish Journeys on the Volga." There are also papers dealing with Sweden's relations with Russia, for years a favorite subject with Professor Hjärne, as well as with other phases of Swedish diplomatic history; but the majority of them treat of the interior political development of Sweden. C. Hallendorff's "The Negotiations Regarding the Scandinavian Countries' Declaration of Neutrality during the Crimean War," C. A. Reuterskjöld's "On the Realization of the Idea of Neutrality in Recent Swedish History," and R. Kjellén's "1866 and 1909: Historical Notes on the Suffrage Question in Sweden," are of actual interest just now. Under the title Gleerupska biblioteket the house of C. W. K. Gleerup in Lund has begun a series purporting to show nature and man's life in description and pictures, divided into five groups: History of tbe World, History of Sweden, Geography, The Book of Nature, and The Book of Labor, written in collaboration by a number of competent Scandinavian scholars. The History of the World, already well under way, deals not merely with politics and war, but with civilization as a whole, human activity in its various phases, and ideas and beliefs.

Under the title Ljus: populärvetenskaplig studieledare (Stockholm: Aktiebolaget Ljus), the Popular Education League of Students from Norrland has begun a series of guides to scientific studies, well calculated to supplement the well-known Småskrifter and Folkskrifter, published by the two student societies, Verdandi and Heimdal, in Upsala. Each number of the new series will be complete in itself and cover a single science or branch of science, giving an account of its scope and problems, its history, and "the rôle it has played in the struggle of mankind for spiritual liberation." The authors aim particularly to furnish a guide for further studies. Among the numbers so far issued are: "The Study of Religion," N. Söderblom; "The Religion of the Old Testament," S. A. Fries; "The Physiology of Our Time," T. Thunberg, with an interesting account of the work in Pavlov's laboratory in St. Petersburg; and "Sociology," G. F. Steffen. The series is ably introduced by an essay, "Bildning och självstudier," by Hans Larsson. "The era of geographical discoveries is closing, that of geographical conquests is beginning," says Emil Svensén in his latest book, "Geografiska eröfringar" (Stockholm: Geber). The work is a survey of such conquests as have already been accomplished, among them the subjugation of the Nile, the regulation of the Hoang-Ho, the drying out of the Haarlem Sea. The chapter on "The Future" discusses the possibilities of the reclamation of Sahara and the regulation of the Gulf Stream. O. M. Reuter's "Djurens själ" (Stockholm: Norstedt) is tbe first comprehensive work on animal psychology in the Swedish language. While it is a perfectly objective treatise and in no way the work of an advocate, the author hopes that it may aid in the movement for proper protection of animals. He regards "a soul," a thinking and feeling faculty of some sort, as existing in all animals, but does not wish to claim for them a higber intelligence than "the simplest that is necessary in order to explain known facts."

In "Naturkunskapens självfbesinning" (Stockholm: Hiertas bokförlag), Prof. Vitalis Norström criticises the modern theories of "natural philosophy," as represented especially by Ostwald and Mach, from the point of view of a rationalistic idealism whose chief thesis is that the main criterion of truth is to be found in its ethical value: "That conception is true which makes life on the whole more perfect." One basis for the author's reasoning is the tendency of modern science, so pronounced during the last decades, to bring all its special branches together in coöperation and in working out a uniform conception of the universe. In opposition to the direct, or "natural," conception, the mechanical, and the empirical, Norström puts what he calls the humanistic, or philosophical, which aims at "a measurement of values which originally emanates from a cultivated feeling of the contradistinction between what is and what ought to be." The function of the "natural" sciences is to state and explain facts, while the "humanistic," according to Norström, have the "higher" duty to determine the value of such facts as come within their jurisdiction. The book and Professor Norström's general point of view have been criticised by Allen Vannérus in an interesting article in *Ord och Bild*. Dr. Vannérus, whose "Vetenskapssystematik" has been noticed in the *Nation* (May 28, 1908, p. 495), attempts, in a small volume entitled "Kultursystematik," a classification of the many manifestations of civilization and culture. This presentation, though it is by no means a mere skeleton, must, in its existing form, be regarded as a first draft, which the author might be expected to fill out in more detail. The sketch is connected, in a way, with an earlier essay, "Kulturidealism," in wbich the author presents the essence of his philosophical conviction, and in which we find a short historical account of the development of the idea of culture.

In Hans Larsson Swedish literature has a philosophical essayist of high rank, and his latest volume of essays, "Ideer och makter" (Lund: C. W. K. Gleerup), is well calculated to increase the reputation which he won by his earlier works, "Om intuition," "Poesiens logik," and "Studier och meditationer," the last of which has just appeared in the third edition. "The Struggle for Existence," "The Reliability of Intuitive Judgment," "Immanuel

Kant," "Nietzsche on History and Life," "Plato's Estimate of Poetry and Art" are the titles of some of the studies in the new volume. In "The Cause of Peace and the Rupture of the Swedish-Norwegian Union," written in July, 1905, the author appears as a friend of peace who has been rudely shaken by Norway's apparent betrayal of that cause. In another sketch, "The Freedom of Belles-Lettres," the author attacks the view that literature, properly so-called, must be of a kind that can be put in the hands of everybody:

> It is well that we have come so far as to regard science as unimpeachable in all serious investigations. But the sharp discrimination which is made in this respect between science and art is not fair. The artistic analysis and delineation are driven to take hold of the same problems that science is investigating. The form is different, but the earnestness of purpose is the same.

Professor Larsson would substitute for the more or less official censorship the private, which each individual can exercise in his own circle. August Strindberg's two "Blue Books" offer a "revaluation of all values" which results in a veritable topsy-turvydom—especially in the latter of these volumes, "En ny blå bok" (Stockholm: Björck & Börjesson). This is an omnium gatherum of theology, philosophy, science, Oriental philology, breathing the most implacable hatred and contempt for modern research. The Strindberg of the eighties—the evolutionist, the Socialist, the author of "Mäster Olof," "Röda rummet," "Hemsöborna," "Svenska öden och äfventyr"—is apparently dead, and in his stead has stepped a mystic and obscurantist who abuses what he formerly put on a pedestal, and worships what in his early days he fought with fierceness. Even his power over the language seems to have weakened, at least his abuse has nothing of the earlier directness and picturesqueness. He calls the writings of the modern theological critics "dung-hills." Strindberg is now nothing if not orthodox—and Swedenborgian, after a fashion—and his orthodoxy is of the crassest and most materialistic kind. But still there is a certain fascination in his book; in some respects he is still the old Strindberg, the individualist by the grace of himself, the egotist, if you please; and all through the two volumes we find scattered the keenest observations of life and of man's sub-conscious nature.

"Likt och olikt" is the unpretentious title of a volume of literary essays by Johan Mortensen (Stockholm: A. Bonnier); it contains studies (most of them originally written as book reviews) of such writers as Edgar Allan Poe and Lafcadio Hearn, Gustave Flaubert, and Alphonse Daudet, and among Swedish writers Oscar Levertin, Verner von Heidenstam, and August Strindberg. Of Levertin he says:

> The most singular trait in Levertin as a story teller is perhaps his exquisite power to render the local color and the temper of the time; to catch the mood that hovers over a certain place, to conjure up past times, often with nearly invisible means. In this respect he stands alone and unapproached in Swedish literature.

What strikes one most forcibly in rereading Levertin's essays and short stories as they come out in his "Samlade skrifter" (Stockholm: Bonnier) is the peculiar blend in him of the story-teller and the essayist. This, it would seem, is the explanation of that trait to which Mortensen refers in the passage quoted above. The eighteenth century was the object of Levertin's most intimate studies, and many of his published essays and larger writings may be regarded as material for that great work on "The 'Enlightenment' in Swedish Literature," which he as none else was fitted to write, and for which he had been planning and preparing for many years. At the time of his death he had put together for publication what he called "Last Stories." Swedish literature in Finland has met with a serious loss this year through the premature death of a young scholar of great promise, Torsten Söderhjelm. He had for some time been occupied with a work on the Italian renaissance, on which subject he had already published, in conjunction with Prof. Verner Söderhjelm, a volume of essays that aroused great interest. A belated study of Lucretia Borgia is contained in a volume of posthumous "Uppsatser och kritiker (Helsingfors: Förlagsaktiebolaget Helios), edited by Professor Söderhjelm and Dr. G. Castrén. About half of the volume is devoted to dramatic and theatrical criticism, reprinted from the monthly journal *Euterpe*, of which Torsten Söderhjelm was one of the founders. Of the literary studies those of the Swedish writers, Per Hallström, Sigfrid Siwertz, and others deserve particular mention.

Last year the Royal Library in Stockholm came into possession of a large collection of manuscripts by or relating to Carl Michael Bellman, including a biographical sketch of the poet by his son, which throws new light on his relations to his wife and family, which have suffered not a little as the result of unfounded rumors. The biography and some of the other manuscripts, including some hitherto unknown poems, have been published in a volume, "Bellman och hans diktning: Nya bidrag," by Richard Steffen (Stockholm: Norstedt). There has lately been discovered in the University Library in Upsala Erik Gustaf Geijer's diary during his journey to England, the original source, not only of that part of his "Minnen" which covers this period, but of his letters home. This has now been published in the current volume of *Samlaren*. Anton Blanck, who has edited the diary, is engaged on a study of Geijer's visit to England. The diary is particularly interesting in showing more clearly than before Geijer's relations to contemporary English literature.

A. G. S. J.

Chicago.

NEWS FOR BIBLIOPHILES.

An elaborate and extensive bibliography of the writings of Jonathan Swift, by W. Spencer Jackson, forms the larger part of Vol. XII of the new Bohn Library edition of Swift's "Prose Works" (The Macmillan Company). Though there has been an interest among collectors in first editions of Swift's writings definite information has not been accessible. The only serious effort heretofore made in this direction was Stanley Lane Poole's "Notes" in the *Bibliographer* for November, 1884. Mr. Jackson's work seems to have been well done. The transcripts of title-pages are somewhat condensed and the collations are brief, but both are full enough, probably, for practical purposes. Advertisement pages, which are of importance from the collector's point of view, are not generally noticed. No mention is made of the large and thick paper copies of the "Polite Conversation," and the copy examined by the present writer contains a leaf of "Books printed for B. Motte and C. Bathurst" preceding title, and a half-title (with "Dramatis Personæ" on verso) preceding text, which are not included in his collation. The Hoe Catalogue is probably correct in giving as the first the Dublin edition of "Cadenus and Vanessa," which has the date misprinted "2726," and the title reading, "From the original copy," whereas Mr. Jackson gives the preference to J. Roberts's London edition. Such copies of the various books as are found in a number of the largest libraries, are indicated, but the only large paper copy of "Gulliver's Travels," mentioned is the one in the British Museum. There is a copy in the Lenox Library here, and copies are found in at least three private libraries in New York. The elaborate index to the works, which forms the latter third of Vol. XII, does not, apparently, refer at all to the bibliography.

A fine catalogue, with reproductions, just issued by T. De Marinis & Co. of Florence, describes no less than five manuscripts of Dante. The most important (priced at 30,000 lire) is of the first half of the fifteenth century, in the old binding of wood, with calf back. It contains the "Divina Commedia," "Convivio," and "Canzoni," and also the "Trionfi" of Petrarch. Another, the "Divina Commedia," on 207 leaves, is dated "Verone die quinto Aprilis ora vigesima, 1449." In the same catalogue is offered a copy of the rare first Aldine Horace, "Mense Maio M.DI," a large copy, with the initials painted and gilded. This is the second book printed with the first italic type ever cast, and in value and interest, among all the Aldines, is probably surpassed only by the Virgil, printed with the same types, but published earlier in the same year.

Good prices ruled generally at the auction of the books of Edwin N. Lapham of Chicago at Anderson's, in this city, December 1-3. The prize lot was the set of "Pickwick," in parts, which brought $1,450. A good set of Pickwick in the original parts, every leaf and cover genuine, can he had readily for $100, or perhaps less. The superiority of the Lapham copy lies in the fact that the covers of the parts, and the advertisement leaves, are for the most part "first issue." When the publication of Pickwick began, its success was douhtful, and probably not more than five hundred copies of the earlier numbers were at first printed, while the first issue of later numhers was more than twenty thousand. The front cover of Part i reads, "With four illustrations by Seymour" and that of Part ii "With Illustrations by Seymour." After he had engraved three pictures for Part ii, Seymour committed suicide; and for Part iii a new artist was secured, R. W. Buss; the earliest copies read. "With Illustrations by R. W. Buss." It is said that for this part alone Mr. Lapham paid £80 or £100, and virtually the price was for this cover alone. Buss's illustrations were, however, unsuccessful, and Hablot K. Browne ("Phiz") made two new plates for Part iii, as well as the illustrations to all the later parts. The covers of the later issues of the first three parts, as well as those of the later ones, read simply, "With Illustrations." Mr. Williamson's copy, the best previously offered at auction in this country, sold last January for $755, and that record is now nearly doubled. Though the value of these exceptional copies is likely to increase, ordinary copies bound up, without covers or advertisement leaves and with the edges trimmed, are not appreciating in value. First editions of Dickens's other books brought the following prices: "Sketches by Boz" (1836-37), both series, 3 vols., original cloth, $205; "The Library of Fiction" (1836-1837), 2 vols., containing two stories by Dickens, original cloth, $41; "Memoirs of Joseph Grimaldi" (1838), 2 vols., first issue, original cloth, $40; "Oliver Twist" (1838), 3 vols., first issue, original cloth, $40; "Nicholas Nickleby" (1838-39), parts, $31; "Master Humphrey's Clock" (1840-41), in twelve monthly parts, $55; "A Christmas Carol" (1843), first issue, in hrown cloth, a presentation copy to Albany Fonblanque, with inscription in Dickens's autograph, $270; "Martin Chuzzlewit" (1843-44), parts, $30; "David Copperfield" (1850), parts, $51; "To be Read at Dusk" (1852), a scarce pamphlet, $101; "A Tale of Two Cities" (1859), parts, $75; "Great Expectations" (1861), 3 vols., original cloth, $65; "The Uncommercial Traveller" (1861), original cloth. $28.

Some of the more important first editions of Charles Lamb, with the prices paid, were: "Original Letters of Sir John Falstaff" (1796), original boards, uncut, $45; "A Tale of Rosamund Gray" (1798), second issue, with the London title-page, $360; "John Woodvil" (1802), original boards, perhaps a presentation copy, though the inscription was not in Lamb's autograph, $110; "Tales from Shakespeare" (1807), 2 vols., $247; "The Adventures of Ulysses" (1808), original sheep, $70; "Mrs. Leicester's School" (1809), original boards, uncut, very scarce thus, $205; "Elia" (1823-32), both series, morocco, uncut, $290; "Album Verses" (1830), original boards uncut, $28; and "Satan in Search of a Wife" (1831), original paper cover, $26. A few of the other prices were: Mrs. Browning's "Sonnets" (Reading, 1847), $460; "Jane Eyre" (1847), original cloth, $130; the Brontë Sisters' "Poems" (1846), with the original title-page, with imprint of Aylott and Jones, $115; the same book, with the substituted title-page of Smith, Elder & Co., $5.50; Burns's "Poems" (Edinburgh, 1787), morocco, uncut, $218; Francis Wrangham's "Poems" (1795), containing two poems hy Coleridge, $50; Goldsmith's "The Traveller" (1765), $150; 'The Vicar of Wakefield" (1766), $570; "The Deserted Village" (1770), $150; "Retaliation" (1774), $150; "She Stoops to Conquer" (1773), $140; Hewlett's "Earthwork Out of Tuscany" (1895), $39; Keats's "Poems" (1817), "Endymion" (1818), and "Lamia" (1820), sold as a set, $665; a set of Hardy's novels, 33 vols., each volume autographed by the author, $310; a set of Lady Jackson's historical works, all but one presentation copies to her brother, $117.50; Charles Lever's works, 55 vols., with the original cloth or paper covers bound in, $760; Shelley's "St. Irvyne" (1811), uncut and with the rare half-title, $330; Alastor" (1816), edges trimmed, $190; "Laon and Cythna" (1818), uncut, $250; "The Revolt of Islam" (1818), uncut, $135; "Rosalind and Helen" (1819), uncut, $85; "The Cenci" (1819), edges trimmed, $225, "Prometheus Unbound" (1820), uncut, $95; "Adonais" (1821), edges trimmed, but with the original covers preserved, $820; Tennyson's "Poems by Two Brothers" (1827), uncut, $100; "Poems, Chiefly Lyrical" (1830), uncut, $70; "Poems" (1833), uncut, $80, "Poems" (1842), uncut, $94; "Helen's Tower," with ten lines of verse by Tennyson printed on the last leaf, $390; "Carmen Saeculare" (1887), the first issue, never before offered at auction in America, $245; Thackeray's "Second Funeral of Napoleon" (1841), in the original paper cover, $341; "Comic Tales and Sketches" (1841), original cloth, $127; and "Vanity Fair" (1847-48), parts, $560.

On December 14 and 15 the Anderson Auction Co. of this city sells the library of George Van Nest Baldwin, with an addenda, containing a long list of first editions of Henry James. On December 16 and 17 Anderson sells a private library, containing Burton's "Arabian Nights," the original edition, 17 vols.; Dean Sage's "The Ristigouche and Its Salmon Fishing," 1888, one of the most valuable of American angling books, 105 copies only having heen printed; and Pine's Horace, engraved throughout, first issue, with the misprint "post est" for "potest."

Correspondence.

THE MOVEMENT FOR UNIFORMITY IN COLLEGE REQUIREMENTS.

To the Editor of The Nation:

Sir: Teachers of Latin in all parts of the country are asking, through their various associations, for changes in the college entrance requirements. The contentions are two: First, that the lack of uniformity in the work demanded by the colleges imposes an unnecessary burden on the schools, by compelling division of classes and increased labor of teachers, involving waste of energy and a resulting inefficiency in teaching. Second, the large amount of prescribed literature leaves the schools little opportunity to develop courses of study suited to individual needs. For these two reasons the universities and colleges of America are petitioned, first, to establish uniform requirements for the college entrance examinations in Latin, expressed in identical terms; second, to prescribe as a basis of the set examinations much smaller portions of the literature than are now prescribed by some institutions—testing the power to read the language by simple examination at sight, and thus leaving to the schools the choice of the major part of the reading to be done by their students. It is thus evident that teachers of Latin are asking, first, for such uniformity and definiteness in requirements as teachers of English, after a long struggle, have actually secured; and, second, such freedom in the choice of texts as many teachers of English are still endeavoring to secure.

The contention that the lack of uniformity in Latin requirements is an unnecessary burden to the schools is sustained hy an examination of our leading colleges. Of some twenty-five institutions, for example, no three have identical requirements, although some of them accept alternatives. Seven of these institutions test the required proficiency in grammar by examinations based on the second, third, and fourth speeches of Cicero against Catiline; five, hy examinations on both Cæsar and Cicero as wholes; and two by a "thorough examination" on the first two hooks of the Æneid. Five of the colleges that make formal distinctions between the elementary and the advanced requirement include Cæsar and Cicero, but no poetry in the elementary requirement, while fifteen others include both Cicero and poetry. To the individual colleges these variations seem small matters: to the schools they spell confusion. In reply to the remonstrances of the preparatory schools, some of the colleges have specified alternatives which they are ready to accept in place of certain prescribed works. But these alternatives offer such manifold variations that they are not widely helpful.

In an attempt to remedy the difficulties the Classical Association of New England adopted general resolutions. Acting upon these, the Classical Association of the Middle States and Maryland proposed the adoption of the following specific plan of entrance examinations:

(1.) The requirements for admission to college in Latin shall he: (a) a thorough knowledge of the forms and inflections of Latin; (b) a thorough knowledge of the chief principles of Latin syntax; (c) a thorough knowledge of a vocabulary of 2,000 Latin words and their English equivalents; (d) the ability to scan the Latin hexameter.

(2.) The primary intent of entrance requirements in Latin shall be to test the candidate's knowledge of Latin, and his ability to make use of that knowledge. To that end the entrance examinations in Latin shall be divided into four parts: (a) Prose composition (Latin writing in prose). This examination shall be in two parts: the first part shall consist of detached sentences requiring knowledge of Latin forms and exemplifying the principles of Latin syntax; the second of a short passage of easy narrative, destined to test the ability of the candidate to write Latin consecu-

tively; (b) a short passage of moderate difficulty from some Latin prose author, to be translated and explained at sight; (c) a short passage of moderate difficulty from some Lat'n poet, to be translated and explained at sight; (d) a special examination on a particular prescribed portion of Latin literature, of limited extent (1,500 lines, more or less, prose or verse), *e. g.*, "De Bello Gallico," vii, Æneid iv or vi.

This plan, or some modification of it, seems now likely to be accepted.

What has been done toward uniformity in English requirements, and what seems almost accomplished with reference to Latin, should now be undertaken with reference to other subjects, notably mathematics. A table exhibiting the algebra requirements of seventeen universities and colleges— including Columbia, Cornell, and Princeton, as well as the leading colleges for men in New England—shows at a glance a wide diversity. Of the fifteen items presented in this table as parts of the elementary requirement, only five are prescribed by all these institutions. The advanced prescriptions display even greater variety. No two are alike. And the history of college entrance requirements gives abundant evidence for the assumption that most of the wide divergencies serve no worthy and generally recognized purpose, that they are whims—tolerated by college faculties from a pernicious sense of "departmental courtesy." The committee of twelve of the New England Association of Colleges and Preparatory Schools is now at work on the problem, and hopes soon to offer recommendations similar to those already adopted with reference to Latin. That is to say, it hopes to secure an agreement, at least among New England colleges.

Not only are the schools much hampered by the present diversity of requirements. The work of the College Entrance Examination Board, a work growing every year, is seriously complicated. Owing to the large number of separate examinations now rendered necessary, the board is unable to devise a time-schedule confined to a reasonable number of days. The requirements in Latin, for instance, make it necessary for some candidates to take no less than six or seven separate examinations requiring nearly ten hours of writing. The adoption of uniform requirements, or even the elimination of the apparently useless variations, would be a great aid to this important board. WILLIAM T. FOSTER.

Brunswick, Me., November 27.

FACTS AND FIGURES FROM SHAKESPEARE.

TO THE EDITOR OF THE NATION:

SIR: While looking into Sidney Lee's "Shakespeare and the Modern Stage" (London, 1906), my eye fell upon the following sentence (p. 116):

> "Hamlet" is the longest of Shakespeare's plays; it reaches a total of over 3,900 lines. It is thus some 900 lines longer than "Antony and Cleopatra," which of all Shakespeare's plays most nearly approaches its length.

In his "Life of Shakespeare" (London, 1898), Mr. Lee had said (p. 224):

> Except "Antony and Cleopatra," which exceeds it by 60 lines, the piece ["Hamlet"] is the longest of Shakespeare's plays; while the total length of Hamlet's speeches far exceeds that of . . . any other of his characters.

On page 239 of the "Life" he says that "Macbeth" is "the shortest of all Shakespeare's plays"; and on p. 254 that "The Tempest" is the shortest except "Macbeth" and "The Two Gentlemen of Verona."

All these statements are incorrect. Personally I care very little for these statistics, but, in the course of the last forty years or so, I have found that many teachers, students, and critical readers of Shakespeare are interested in them; and if the figures are printed at all they should be given accurately. "Hamlet" is the longest play (3,930 lines), but "Antony and Cleopatra" (3,063 lines) is not the next longest, *ten* others coming between the two: "Richard III." (3,618 lines), "Troilus and Cressida" (3,496), "Henry IV.," Part 2 (3,446), "Coriolanus" (3,410), "Henry V." (3,380), "Cymbeline" (3,341), "Lear" (3,336), "Othello" (3,317), "Henry IV.," Part 1, (3,177), "Henry VI.," Part 2 (3,161), and "The Winter's Tale" (3,074). On the other hand, "Macbeth" (2,109 lines) is not the shortest by *two* plays: "The Comedy of Errors" (1,778) and "The Tempest" (2,065). "A Midsummer Night's Dream" (2,180) comes next, while "The Two Gentlemen" (2,294), which Mr. Lee reckons as the third shortest, is the *fifth*. The numbers, by the way, are those of the Globe edition, now taken as the standard for line-numbers by all the recent editors, and in books of reference (Schmidt's "Lexicon," Abbott's "Grammar," etc.).

Mr. Lee is correct in saying that Hamlet speaks more lines (1,569) than any other of Shakespeare's characters (that is, in a single play); and next come Richard III. (1,161), Iago (1,117), and Henry V. (1,063). Then follow Othello (888), Coriolanus (886), the Duke in "Measure for Measure" (880), Timon (863), and Antony in "Antony and Cleopatra" (829). These are all the characters, male or female, above 800 lines. Between 800 and 700 there are five male characters; between 700 and 600, four males; between 600 and 500, seven males; and between 500 and 400, eleven males—including such important personages as Ulysses (488), Benedick (474), Henry VIII. (457), Wolsey (436), and King John (435). Among those below the 400 mark, the most notable are Kent in "Lear" (379), Shylock (364), Orlando (322), and Malvolio (306). Hamlet's 1,569 lines are exceeded by three characters who appear in more than one play: Henry V., who, in addition to the 1,063 lines in the play named for him, has 616 in "Henry IV.," Part 1, and 308 in "Henry IV.," Part 2, or 1,987 in all; Falstaff, with 719 in "Henry IV.," Part 1, 688 in "Henry IV.," Part 2, and 488 in the "Merry Wives," or 1,895 in all; and Richard III., who, besides the 1,161 lines already mentioned, has 24 in "Henry VI.," Part 2, and 390 in "Henry VI.," Part 3, or 1,575 in all. Antony, besides the 829 lines in "Antony and Cleopatra," has 327 in "Julius Cæsar," or 1,156 in all. Bolingbroke has 414 in "Richard II.," 341 as King in "Henry IV.," Part 1, and 294 in "Henry IV.," Part 2, or 1,049 in all. These are the only characters of this group who exceed a thousand lines; and only two others, I think, have more than 500 lines: Richard, Duke of York, with 737 lines in the three "Henry VI." plays; and Warwick, with 568 lines in the second and third of that series.

What female character in the plays has the most lines? I have found that nine persons out of ten guess that it is Portia—probably because of the part she plays in the trial scene—but Rosalind heads the list with 749 lines, followed by Cleopatra with 670, and Imogen with 596, while Portia has only 589. Then come Juliet (541), Helena in "All's Well" (479), Isabella in "Measure for Measure" (426), Desdemona (389), Queen Katharine in "Henry VIII." (374), Mrs. Page (361), Viola (353), Paulina in the "Winter's Tale" (331), Julia in the "Two Gentlemen of Verona" (323), Olivia in "Twelfth Night" (321), Margaret of Anjou in "Henry VI.," Part 2 (317), Volumnia (315), Cressida (312), Beatrice (309), the Countess in "All's Well" (306), and Celia in "As You Like It" (304). I think these are all that exceed 300 lines in a single play. Among the nine women that I have noted between 200 and 300, the most important are Constance (263), Lady Macbeth (261), Kate the Shrew (220), and Hermione (211)—all of whom I fancy that many even among critical students and readers will be surprised to find so far down in the list; as they will also be to learn that among those below 200 are Ophelia (175), Miranda (142), Perdita (128), Cordelia (only 115), and Portia in "Julius Cæsar" (only 92). Of the few women who appear in more than one play (all in the English historical plays) the most remarkable is Margaret of Anjou, the only character of either sex who appears in four plays, and the only woman who in the aggregate exceeds Rosalind's 749 lines. Margaret has 33, 317, and 279 lines in the three parts of "Henry VI.," and 218 in "Richard III.," or 847 in all. Lady Grey (*proxima, sed longo intervallo*) has 73 lines in "Henry VI.," Part 3, and 274 in "Richard III.," or 347 in all.

The part that the women have in a play, compared with the men, varies greatly. In "Timon of Athens" the three women have only fifteen lines in all. In "Henry IV.," Part 1, out of 3,180 lines they have only 115. On the other hand, in "As You Like It" (2,867 lines), they have 1,163; in "All's Well" (2,966), 1,013; in "Romeo and Juliet" (3,053), 949; in the "Merry Wives" (3,019), 900; in "Antony and Cleopatra" (3,063), 845; and in "Twelfth Night" (2,692), 843 lines.

It should be understood that in all these statistics half-lines or parts of lines at the beginning or end of speeches are counted as whole ones, though in the Globe edition they may often be properly numbered as parts of lines in the preceding or following speech. If *all* the lines of *all* the characters in a play are thus counted *separately*, the total will always be greater than the actual number of lines in the play counted *continuously*, as in the comparative lengths of plays given above.

The history of the blunder in regard to the length of "Antony and Cleopatra" is curious, and, it may be of interest as illustrating the persistent vitality of misprints, though by no means an extreme instance of the kind. This one is now only thirty-four years old, but it may attain to a much greater longevity. It had its birth in a paper on "Metrical Tests," by F. G. Fleay, read before the New Shakespeare Society of London in 1874. In the accompanying tables the number of lines in "Antony and Cleopatra" was given as 3,964; but the appended numbers of prose lines, blank verse, and rhymed lines add

up to exactly 3,064. Mr. Fleay, in copying his figures for the table, apparently mistook the zero for a nine (his handwriting was very bad), and neither he nor his fellows in the New Shakespeare Society detected the error, though the paper was thoroughly discussed at that and the following meeting. He reprinted the table in his "Shakespeare Manual" (1876), a book which was severely criticised for its many misstatements, misquotations, and other faults (but not this one), by Dr. Ingleby, in the London *Academy* (August 19, 1876); but in 1881 Dr. Ingleby allowed Mr. Fleay to insert his metrical tables, much extended and carefully corrected, in Part II. of his own "Shakespeare: The Man and the Book." Up to 1881, so far as I know, the error as to the length of "Antony and Cleopatra" had not been detected in Europe, though it had been often quoted by Shakespeare scholars on both sides of the Atlantic. I happened to see it in 1880, while preparing my first edition of the play, published early the next year, but I think I did not refer to it in print. It reappeared in a book by one of our most eminent critics less than a year ago. No reviewer has pounced upon it there, I think, and it may survive for many a year yet.

W. J. Rolfe.

Cambridge, Mass., November 15.

AN UNNOTED ELIZABETHAN SOURCE.

To the Editor of The Nation:

Sir: Emil Koeppel, the latest authority on the subject, says ("Quellen-Studien zu den Dramen Ben Jonsons," etc., p. 83) in regard to the farcical portion of Fletcher's "Humorous Lieutenant":

> Fletcher found the basis of the comic action in a closely corresponding anecdote of a soldier of Antigonus, which is unquestionably very old, but has hitherto been known only in a somewhat later English version, in a collection of anecdotes compiled by Thomas Forde, published in 1660, entitled "A Theatre of Wits Ancient and Modern, represented in a Collection of Apothegmes Pleasant and Profitable."

The anecdote does not, indeed, occur in the various accounts of the life of Demetrius, on which the play is founded; but in Plutarch's Pelopidas (North's translation), Chapter i, we read:

> The report goeth, that king Antigonus gave paye to a souldier among other, that was very hardie and venturous, but he had a naughtie, sickly bodye. . . . The king, hearing him say so, commaunded his Phisitions and Surgeons to looke to him and if he were curable, that they should heale him with all possible speede and so they dyd. After the souldier had his health againe, he would venter no more so desperately in the warres, as he dyd before. In so much, king Antigonus selfe perceiving his slacknes, and drawing backe, rebuked him, and said unto him: that he wondred to see so great a chaunge and alteration in him. The souldier, never shrinking at the matter, told the troth plainely. Your selfe, and it please you majestie, is cause of my cowardlynes now, by healing my disease, that made my life lothsome to me.

Wellesley Hills, Mass., December 1.

ZACHARY TAYLOR'S LETTERS.

To the Editor of The Nation:

Sir: I have just seen the *Nation* of October 8, containing a notice of the "Letters of Zachary Taylor from the Battlefields of the Mexican War"—a privately printed volume prepared from the original manuscripts in the collection of William K. Bixby of St. Louis. The notice concludes with the following words:

> William H. Samson has prepared the letters for printing and the very erratic spelling leads one to suspect that the copyist was at fault.

This is an unjust reflection on me, for in the introduction signed by me the statement is made that the letters "are printed precisely as he [Taylor] wrote them—without the omission of a single word, without a change in spelling or punctuation." In the introduction I took special pains to point out the disadvantages under which General Taylor wrote, and urged the reader to be "lenient in criticism of the language in which the old soldier clothed his thoughts." In view of these statements, why should your reviewer, who never saw the original manuscripts, "suspect" that anybody was "at fault"?

By the way, your readers may be interested in knowing that common American books of reference differ as to the date of Zachary Taylor's birth, and that the correct date, ascertained from the family records, is given in the introduction to this volume. He was born at Hare Forest, Orange County, Va., November 24, 1784. The sketch of Taylor in Appleton's "Cyclopædia of American Biography" was written by Jefferson Davis, whose first wife was Taylor's second daughter. That sketch gives the date as September 24, but this is by no means the only blunder; of others, the most astounding is his statement that he had married the eldest daughter, instead of the second. Your readers may also be interested in knowing that the famous "Miss Betty," who presided over the White House when Gen. Taylor was President, is still living. Mary Elizabeth Taylor, the fifth of Gen. Taylor's daughters, and the third to survive the perils of childhood, was born near Louisville, Ky., April 20, 1824—not 1826, as Davis said in his biography of her father—and on December 5, 1848, soon after her father's election to the Presidency, was married to Major William Wallace Smith Bliss, a gallant soldier of brilliant mental attainments who had been Taylor's chief of staff and was destined to become his private secretary. Bliss died at East Pascagoula, Miss., August 5, 1853. On February 11, 1858, his widow married Philip Pendleton Dandridge of Winchester, Va., whom she survives.

William H. Samson.

Rochester, N. Y., November 23.

[We are sorry if we have done Mr. Samson an injustice. Our reviewer based his opinion (1) on eighteen long letters of Taylor, of the same period, in the Library of Congress, in which the spelling does not show more than ordinary lapses; and (2) on a comparison of Mr. Samson's own pages. It may perhaps be regarded as permissible for a man to drop a final letter when writing hastily, and to indulge in some *consistent* misspelling— that is, misspelling the same word whenever written. Taylor did occasionally drop a final letter, as "cas" for "case" (p. 162) and "forse" for "foresee" on the same page. But where a man, as a rule, spells correctly, and Taylor was a fair speller, one may question the accuracy of printing "youg" (p. 168) where "young" is intended; it should have appeared "yong," if at all. So "contageon" and "contagion" are given in the same letter (pp. 131, 132) and "terable" on page 147, when there are sufficient strokes of the pen to allow of terrible. Such instances led the reviewer to suggest possible errors in copying the letters.—Ed. Nation.]

AN OPINION OF THE FILIPINOS.

To the Editor of The Nation:

Sir: It seems to me that the inclosed extract from a letter written by a college graduate who is engaged in work in the Philippine Islands would interest many of your readers. I send it to you, therefore, in case you should think fit to publish it.

E. M. H.

Moscow, Idaho, November 16.

> There at home now I suppose you are in the thick of the Presidential campaign. The Americans over here are hoping that the Philippine question will be discussed actively during this fall campaign. While there is little practical difference between the Republican and Democratic positions on the question, a discussion of the question would do a whole lot of good if it only got the people interested. I have become convinced, since I came over, that the Philippine question is one of the most important and about the most ignored of all our public problems. Naturally it is the all-engrossing topic with the Americans in the islands. And after one has listened diligently for a few months to the opinions of all sorts of men, and made a few observations himself, he is prone to deny the finality or wisdom of our present Philippine policy. I think McKinley sat down one day, after lunch, and lit a cigar, and evolved the Philippine policy before he got up again. However he formulated it, it has been followed with admirable consistency ever since. It is the laudable scheme of fitting these people for self-government and then presenting them with independence.
>
> To govern themselves a people must have some vital conception of public honesty and observance of law. In this municipality the president, vice-president, and justice of the peace were caught the other day deliberately breaking the internal revenue laws regarding buying tobacco. A supervising teacher gets some lumber to build a school house, and one of his subordinate Filipino teachers steals it as soon as the American is gone. Public officials graft without shame at every opportunity. A Chino-Filipino district judge imposes a merely nominal fine on Chinos convicted of violating the opium law.—Etc., *ad libitum*.
>
> To govern themselves a people must also be endowed with at least a small measure of industry. A public road is being built in the province north of this one. The government engineers are offering A1 wages for men, all sorts of natives are lying around their houses doing nothing, except petting their fighting cocks and eating their meals. So the road must be built by labor brought clear from Manila. The explanation of this state of affairs is this: When a native harvests a good corn or rice crop and has, therefore, an assured food supply for a little while, he immediately quits work. When a carpenter working on a house has drawn three or four days' pay, he forthwith decides that it is no longer needful to work, and lays off as long as his money lasts. And yet if a famine comes or a flood sweeps the crop away, the improvident creatures throng the houses of the better Filipino families and the Americans, begging for enough to feed them.
>
> Considering these things it seems unlikely that the Filipinos will be ready for independence in any twenty years, or forty years or fifty years. Suppose they could reach the goal in fifty years. The United States would have poured into these islands untold billions in money and brains and lives; then it would be gone, every sou of it, in the twinkling of an eye.
>
> Some Americans over here declare that

we should drop the Philippines like a hot biscuit, and *do it now*. They say so because they believe the Filipinos will never reach the place where they can conduct a decent popular government. They point to the fact that this cry for independence is nourished and kept alive by the *principales*, the aristocratic families, constituting about 10 per cent. of the population. This upper tenth sees in independence unlimited power and opportunity for grafting the peasantry. After all, the Filipinos are only Malays. And did you ever hear of a Malay republic? Or did you ever hear of *any* Malaysian government not despotic? Incidentally, did you ever hear of any respectable popular government anywhere in the tropics?

Notes.

Longmans, Green & Co. announce as soon forthcoming, "Anselm's Theory of the Atonement," by the Rev. George Cadwalader Foley; "The Philosophy of Revelation," by Prof. Herman Bavinck of Amsterdam; and "Sir George Mackenzie, the King's Advocate (Bluidy Mackenzie), 1631-1691," by Andrew Lang.

A committee of friends of the late Edwin Burritt Smith of Chicago—George Laban Paddock, Albert Harris Tolman, and Frederick William Gookin—proposes to publish a memorial volume containing the more important papers and addresses of Mr. Smith, provided a sufficient number of copies is subscribed for in advance to defray the cost of publication. The volume, an octavo of about 375 pages, will contain a portrait of Mr. Smith. Subscriptions ($2.50), should be sent to Mrs. Edwin Burritt Smith, No. 5530 Cornell Avenue, Chicago.

It is proposed to publish a memoir of the late Dr. Walter Headlam, which will be written by Cecil Headlam, his youngest brother. Any friends of Dr. Headlam who have letters or impressions which they would care to communicate, are invited to send them to Mr. Headlam, Esthwaite Mount, Hawkshead, near Ambleside. Dr. Headlam's edition of the "Agamemnon" of Æschylus has been found to be in a much more advanced state than was expected, and arrangements are in progress with a view to its publication.

Sir Herbert Thompson has edited the Coptic (Sahidic) version of certain books of the Old Testament, from a papyrus in the British Museum. This papyrus contains parts of Job, Proverbs, Ecclesiastes, the Song of Songs, the Wisdom of Solomon, and Ecclesiasticus, which are now printed in this version for the first time, together with a collation of all other printed Sahidic texts of the same portions of the Old Testament. The volume will be published by Henry Frowde.

Henry Holt & Co. bring out a new edition of René Bazin's "Italians of To-day," translated by William Marchant, with only the notice of copyright, 1897, to show that it is a reprint. (See the *Nation* of November 11, 1897, p. 382.) The title-page is thus a trifle misleading, for the Italians of to-day, though perbaps not much changed, are yet, in many places, not quite the same men and women as toward the end of the nineteenth century. As the informed reader gets on, he sees for himself when René Bazin was in Italy. Umberto is King; Ada Negri a girl in the twenties; there is a scarcity of silver coin; the *risanimento* of Naples is in progress; Fogazzaro is spoken of as the author of "Daniele Cortis," with no mention of his "Piccolo Mondo Antico." But, whatever their dates, good books are always good books. Bazin talks to us like a clever, cultivated man, sitting, say, in his club, and clearly and vividly, with artistic self-restraint, telling his friends of his travels in Italy, of the people he met there, of the impression things made upon him.

Since the date of its first publication in 1895 (see the *Nation*, July 25, 1895, p. 65) A. F. Mummery's "My Climbs in the Alps and Caucasus" (Scribner) has remained a standard work among Alpine climbers and lovers of adventurous travel. The book is again reissued, with an introduction by Mrs. Mummery and an appreciation of the author by J. A. Hobson. The reproductions of Mr. Pennell's drawings and the photogravures retain their clearness, despite the number of times the plates have been through the press. It is altogether a beautiful book.

Eric Parker's volume on "Surrey" calls attention once more to the unusual excellence and similarlty in tone preserved in this series of the Highways and Byways (Macmillan). They are without a rival in their happy union of the guide book and the book of personal impressions. Mr. Parker apologizes in his preface for leaving out of his survey the ten miles south of the Thames that have been transformed in recent years by the spreading out of London, but he has been wise to restrict himself to the older unchanged country still virgin of the suburb. And there is plenty left to fill his book with interesting recollections. His plan of survey has been simple and will recommend itself to other explorers. Setting out in the morning he has walked until evening, and has then returned by train to the point be started from. His record has all the leisureliness and lightness of the free pedestrian. Of literary memories Surrey is full. Charles James Fox at St. Anne's Hill, Fanny Kemble at Weybridge, John Evelyn at Wotton, Sir William Temple and Swift at Moor Park, Cowley at Chertsey, Matthew Arnold at Pain's Hill, Fanny Burney at Juniper Hall—these are but a few of the names that meet one from page to page. Here, too, are the royal palaces at Richmond and Kew, with their reminiscences of the Georges, of which Mr. Parker makes less than he might. Altogether it is delightful reading of its kind. The illustrations are by Hugh Thomson, and are more distinct than the sketches in some of the other volumes of the series, while missing no charm of light impressionism.

Charles Marriott, travelling chiefly third class or on foot, with no impedimenta but a *Rücksack*, has drawn a picture from life in "A Spanish Holiday" (John Lane Co.)—the life unknown to tourists who think, and think rightly, that first-class carriages and botels are none too good for comfort in Spain. But the author was not in search of comfort, and his recital of harmless adventure and first-hand impressions is refreshingly free from the conventional enthusiasms and the heavy burden of historical allusions commonly found in the traveller's tale. To travel third-class in Switzerland is to travel with other aliens. Even the pedestrian scarcely gets into touch with the national life, so completely is it preoccupied with him rather than with itself. But a third-class ticket or a walking tour in Spain brings one directly into contact with the raw Spanish material, and to this contact is due the main interest of Mr. Marriott's book. He does not go further south than Toledo, most of his time being passed in the less frequented Basque provinces; and he finally returns to England in a villainous tramp steamer. But he challenges attention at once by the frank admission of his superficial acquaintance with things Spanish, and holds it by a consistent refusal to generalize from brief experience. There is a total absence of the "knowing it all" air, and thus his passing comments are generally just and to the point. No one, for example, who has lived in Madrid can fail to know as true his surmise that the lower classes are "less out for enjoyment than because it was impossible to find rest or comfort within doors." In his short visit to the Prado he discovered also what admirers of the Spanish school are apt to forget in presence of its masterpieces, that "though Spain has produced great painters as painters, perhaps the very greatest, she has not expressed herself so characteristically in painting as she has in literature." Neither the realism of Velasquez nor of Goya tells us as Cervantes does the truth about Spain. While Mr. Marriott's volume is not one of great permanent value, it is both intelligent and interesting, and will well repay reading. The illustrations are good.

The *American Journal of International Law* for October, just issued, completes the second year. Following the set papers that fill its first ninety pages, appear continuations of departments that have been carried through all the eight numbers—editorial comments, chronicles of international events, a catalogue of public documents relating to international subjects, a review of judicial decisions. The editorial comments in the present number are significant. They contain a list of treaties of arbitration, between seventy and eighty, seven of them treaties to which the United States is a party, negotiated since the conclusion of the first Hague Conference, with summary of the principal stipulations; details of the proposed conference to settle certain questions of maritime law; a summary of proceedings on trial of the first cause brought before the new Central American Court created for settling international disputes; and an optimistic reference to Costa Rica, now likely, as furnishing a member of the court, to participate in future adjudications, and likely to throw her influence in the direction of peace. The international bearing of the new Turkish Constitution—that of 1876 reproclaimed—is also editorially discussed. Appropriately, the separately printed supplement of official documents presents this reproclaimed Constitution in full, together with three treaties applying to the Balkan situation: that of San Stefano, early in 1878, between Russia and Turkey; that of Berlin, a few months later; and that of 1879, between the then late belligerents, constituting a definitive peace treaty. Two of the essays proper, Richard Pearson Hobson's on "Disarmament," and Dr. B. F. Trueblood's on "The Case for Limitation of Armaments," are controversial. Hobson thinks that as the more warlike nations, those least inclined

to settle their disputes peaceably, would retain their armaments, it would be unwise for the more peaceful to discard or weaken their only means of enforcing international obligations and stipulations. Independently of Dr. Trueblood's paper, this same issue contains parts of addresses delivered by Premier Asquith and Chancellor Lloyd-George of the British Cabinet at the recent peace meeting in England, in which steps in the direction of reducing armaments and incidental expense were distinctly advocated by the latter.

The International School of Peace has issued through Ginn & Co. a volume containing the texts of the conventions agreed upon by the peace conference at The Hague in 1899 and 1907. The French originals are accompanied by a parallel English translation. Related documents, such as the Russian imperial rescript of 1898, and others relating to the historical development of international law in the matter of war, have been included. The work is edited by Prof. James Brown Scott, who was technical delegate from this country to the Second Peace Conference. Secretary Root has supplied a brief prefatory note in which, with customary acumen, he lays his finger on the essential importance of the two Hague conferences:

> . . . . a fact which affects our judgment regarding all of the attempts in recent years to secure international agreement upon matters affecting peace and war; this fact is that each attempt is to be considered, not by itself alone, but as part of a series in which sound proposals may come to general acceptance only by a very gradual process extending through many years.

Professor Scott's volume makes a very useful companion volume to Prof. William J. Hull's book on the two peace conferences, published under the same auspices a few months ago and reviewed in the *Nation* of October 2, 1908, p. 386.

Unlike the flood of Lincolniana which the approaching centenary is setting loose, "The Lincoln Centennial Medal," published by G. P. Putnam's Sons, contains something new and excellent. The book is but a frame for Jules Edouard Roiné's exquisite bronze medal of the great President. Hung in a heavy board, the bronze disk presents a happily unidealized profile on the obverse, and, on the reverse, a chaste symbolic wreath of palm and oak surrounding Lincoln's autograph. This medal is so altogether pleasing that one is tempted to cut it out and let the book find its own fate. George N. Olcott's paper explaining the origin and symbolism of the medal is hardly necessary to enjoyment of the latter, though agreeably informing. Richard Lloyd Jones's account of next February's celebration has passing interest. And the "Characteristic Utterances" of Lincoln, being seven and very brief, are scarcely enough.

It is rash to generalize, but we cannot remember reading an anthology of letters that was not interesting. This is not to say, however, that all collections are equally good. One of the best is the little volume published last year, "The Gentlest Art; A Choice of Letters by Entertaining Hands," edited by E. V. Lucas. These letters are mostly by English writers; and a companion volume, "The Friendly Craft: A Collection of American Letters" has been prepared by Elizabeth Deering Hanscom, professor of English in Smith College (The Macmillan Co.). Gathered under various appropriate heads, such as "The News from Home," "Little Men and Little Women," "Students' Tales," "Lovers and Friends," "Genial Gossip," "Makers of History," "Quips and Cranks," and "The Fine Art of Living" is a wide variety of letters from youths and maidens, men and women. The volume is, in our opinion, quite as entertaining as Mr. Lucas's, and that is saying a great deal. The pages contain abundant humor, with now and then a touch of pathos. The generation which has grown up since the civil war will receive from some of the letters of that period—say those of Lincoln, Curtis, and Greeley—an uncommonly vivid impression of the intensity of the strain on men's emotions while the fate of the Union was hanging in doubt. Readers of the *Nation* will be interested to find several bits from Mr. Godkin's hand. Professor Hanscom is to be congratulated on an admirable piece of work.

Seldom is the administration of public schools treated so philosophically and courageously as in W. E. Chancellor's "Our City Schools: Their Direction and Management" (D. C. Heath & Co.). The author's point of departure is his belief that a correct *system* is absolutely essential to good schools; that those charged with the supervision of schools have too long contented themselves with seeking the best results possible under conditions far from perfect; and that they should have the courage to demand the best-known methods both of legislation and administration. Many ideas which he presents seem radical, and yet nearly all may be found exemplified in practice. But however revolutionary some of his proposals appear, he compels us to think and to ask whether we are basing our procedure upon rational principles or merely upon tradition.

The second volume of Charles De Garmo's series, The Principles of Secondary Education, is devoted to "Processes of Instruction" (The Macmillan Co.). A better title for this admirable series would be Principles of Education Applied to Secondary Instruction; for, of course, it is not true nor does the author assume that the principles which he urges are not valid in all educational philosophy. His application of these ideas to the work of the high school is, however, new. The books, used as texts, both by students preparing to teach and those already teaching, should serve to give a philosophical basis for work and lead to an improvement in method. The present volume deals with the acquisition of facts, and their meaning, the educational status of the high school student, the inductive and the deductive approach to knowledge, and processes of application. Insight and efficiency are the supreme results to be secured by our methods of instruction—insight leading to culture, and efficiency to mental discipline. The aim of the book is to render so clear the principles on which the acquisition of knowledge is based that the teacher will instinctively employ the methods that lead to insight and efficiency.

In "Education and Industrial Evolution" (The Macmillan Co.) Prof. Frank T. Carlton discusses the problems of education as related to the social and economic improvement of the people of the United States. The recent modifications in educational science have been away from the leisure-class ideal of education for culture and toward the democratic ideal of education as a means of improving civic and industrial efficiency. These changes must, in the opinion of the author, continue and keep pace with social and industrial evolution. We have passed through three distinct epochs in the development of our educational system, and are apparently entering upon a fourth, in which the social purpose is dominant. The real function of the schools is to adjust the individual to his environment—physical, industrial, and social. The school must aim to demonstrate the social necessity of each worker's task and thus offer a clue to the intricate relations of labor and capital. The book gives a résumé of what has already been done in public education to promote social efficiency and of the present tendencies. It will serve to concentrate attention upon the problems which are perhaps the most vital of all those connected with the schools to-day.

"Chaucer, a Bibliographical Manual" (The Macmillan Co.), by Eleanor Prescott Hammond, is an excellent book. Such a work is, of course, mainly a compilation, but Miss Hammond has the advantage of an extensive first-hand acquaintance with the manuscripts of Chaucer's poems and of the critical discussion which she records, so that her book, as a rule, is marked by a freshness which does not belong to the mere compiler's work. This is particularly noticeable in the sections on the manuscripts and the relative dates of the "Canterbury Tales." In the First Section—on the life of Chaucer—we have, among other things, a useful reprint of the early and generally inaccessible biographical notices of Chaucer by Leland, Bale, Pits, etc. The bibliography of the works themselves is extremely thorough, and includes an exhaustive record of everything relating to the manuscripts, sources, dates, editions, and critical discussion. It is to be regretted, however, that Miss Hammond should so frequently neglect to give the dates of the manuscripts. The only omission worth mentioning as regards the sources which we have noted is in the case of "The Reeve's Tale." As announced through the Chaucer Society last year, J. V. Scholderer appears to have discovered at last the original—or, at any rate, a close analogue—of this tale in the tract entitled "De Generibus Ebriorum et Ebrietate Vitanda," which is reprinted in F. Zarncke's "Die deutschen Universitäten im Mittelalter" (1857). Miss Hammond gives next a careful bibliography of the pseudo-Chaucerian works. A section is also devoted to linguistics and versification. The book concludes with an account of the libraries where most of the Chaucer manuscripts are found, and of the scholars who have contributed most to the elucidation of the poet's works. It is to be noted that Miss Hammond's practical directions in regard to the British Museum are not quite up to date. The ticket of admission to the reading room no longer suffices for the students' (or manuscript) room. A separate ticket is required. In taking leave of this valuable book, we would call attention to one suggestion it contains, which,

if followed up, may, we believe, prove fruitful in Chaucerian investigation, viz.—as to the part that the mediæval *florilegia* played in the poet's reading. It is very likely that much of his knowledge of the classics came from this source.

The activity with which the study of English literature has been pursued at the French *lycées* and universities for some years past has manifested itself in critical and biographical works of high value, such as Angellier's "Burns" and Morel's "Thomson"—to mention only two. Another product of this recent activity is "Les Contes de Canterbury" (Félix Alcan), the first complete translation of the "Canterbury Tales" in French, with the exception of an obscure and valueless one executed about fifty years ago by the Chevalier de Chatelain. The new version is the work of twenty-one French scholars, among whom we recognize the names of Émile Legouis, Derocquigny, and W. Thomas. The introduction (twenty-four pages) is from the pen of Legouis, with whose dissertation on the "Prologue of Good Women"—to say nothing of his more important work on Wordsworth—Chaucer scholars are already familiar. It is, perhaps, a little strong to speak of the "Canterbury Tales" as "un des plus remarquables prolongements a l'étranger de notre poésie nationale," for, after all, Chaucer is more indebted to the Italians than to the French; but M. Legouis's essay is thoroughly appreciative and contains some observations which are well worth noting, such as the one to the effect that what appear as narrative defects in the "Canterbury Tales" often have a dramatic propriety when considered in connection with the character of the particular speaker—so, for instance, in the case of the digression on drunkenness and gambling in the "Pardoner's Tale." On the other hand, there are some errors in the introduction. Like Mr. Saintsbury in "The Cambridge History of English Literature," M. Legouis repeats the old misstatement as to Chaucer's having spent a year in Italy in 1372-3. The *compotus* published by F. J. Mather, jr., in 1896, shows that he was out of England on that occasion only about five months in all—the time of travelling included. It is not correct to say, either, that the "Confessio Amantis" preceded the "Canterbury Tales." The earliest recension of the former work, as the manuscripts state, was completed in 1390, and there is no reason to believe that Gower began his work before Chaucer did his. Furthermore, M. Legouis follows Ten Brink in the statement that Chaucer was allowed to perform his duties as collector of the port by deputy, owing to the intercession of Anne of Bohemia. Documentary evidence, however, proves that it was the Earl of Oxford who brought this about. The translations are based on the text of Prof. W. W. Skeat's "Student's Chaucer" and the few notes are drawn, in the main, from the same scholar's edition of Chaucer in six volumes. Although in prose, the translations are arranged in lines numbered so as to correspond to those of the original poems. This, of course, renders comparison with the original easy. We are sorry to see that in the note to l. 136 of the Prologue in the description of the Prioress —"Ful semely after hir mete she raughte" —the translators prefer to take the last word in the sense of "eructavit" rather than "reached."

"Les Troubadours" by Joseph Anglade treats of the lives, works, and influence of those precursors, in the classic and Albigense period, in Italy, Spain, Portugal, Germany, and of the difference between troubadours and "trouvères" (Paris: Armand Colin). "Le Roman sentimental avant l'Astrée" by Gustave Reynier undertakes French beginnings under influence from Italy and Spain, at the end of the sixteenth and opening of the seventeenth centuries (Armand Colin). Léon Pineau, professor of foreign literature in the university faculty of Clermont-Ferrand, treats in a book of handy compass "L'Évolution du Roman en Allemagne au XIXe siècle" (Hachette). This is a little known world to the general public, for whom pure literature from Germany all but stopped flowing after Goethe and Schiller. Prefacing his studies with the beginnings of that brilliant outburst, the French professor, with an enthusiasm for his theme that surprises, goes into all the reactions and progressions of the last century in a fiction which has certainly not conquered the world.

Karl Wippermann's Deutscher Geschichtskalender (Leipzig: Grunow), which appears in two volumes annually, has just been issued in its first half for the current year. The volume, of more than four hundred pages, contains a full and systematic summary of the world's political events in the first six months of 1908.

In view of the Balkan troubles, the "Generalkarte der südost europäischen Halbinsel" (Berlin: Dietrich Reimer) is a timely map. Its scale is 1:1,500,000 and the size is 85 by 95 centimetres. The railway lines are brought up to the present year and extra maps of the Dardanelles and the Bosphorus have been added.

Theodor Fischer's "Mittelmeerbilder," belonging to a new series, Abhandlungen zur Kunde der Mittelmeerländer (Leipzig: Teubner), contains the results of the study and observation of a leading authority on the Mediterranean lands. Geographical problems, as also questions of the history of culture in these regions, are chiefly discussed in this collection of papers. The final chapter, which treats of the political importance of the Mediterranean nations, is especially interesting, as it speaks also of the Oriental (Balkan) and Egyptian questions.

The latest volume in Die Kultur series (Berlin: Marquardt & Co.) is a book of 118 pages by Dr. Cornelius Gurlitt, "Konstantinopel." It is a brief study of the history and culture of the city presented in the author's lucid and dignified manner, yet popular enough to appeal to the average reader. It contains thirty-two illustrations, many of them reproduced from the photographs taken for a more ambitious work by the same author, "Die Baukunst Konstantinopels," which is being published in parts by Ernst Wasmuth, Berlin.

Dr. Karl Beck of New York is the author of a profusely illustrated volume of travel, in which he describes a trip to the West Indies, Colombia, Panama, and Costa Rica, under the title "Sonnenblicke aus dem lateinischen Amerika" (New York: G. E. Stechert & Co.).

The house of S. Fischer in Berlin attempts to supply the demand for cheap editions of modern fiction in the Bibliothek zeitgenössischer Romane, at the price of 1 mark a volume. The series begins with Theodor Fontane's novel "L'Adultera." Fontane may be called the last of the old and the first of the new school of fiction, and this work marks the beginning of that period in his development, when he began to choose his plots from the society of Berlin in his own time. The second volume contains Jacob Schaffner's "Die Erlhoferin," the story of a brothers' feud, and the scene an old Swiss estate. The first of the foreign writers to appear in this edition is Jonas Lie, who is represented by "Eine Ehe."

Many works by foreign authors are appearing in German translations. Peter Nansen, who has recently celebrated the twenty-fifth anniversary of his literary career by a complete edition of his works in his own country, Denmark, appeals to German readers with a volume of selected stories, "Jugend und Liebe" (S. Fischer), for which his compatriot, Hermann Bang, has written an appreciative preface. Laurids Brun is another Dane to enjoy success in Germany. His "Pan" (Berlin: Egon Fleischel & Co.) is the story of a love which breaks through the crust of social conventions. Johannes V. Jensen is a Danish writer who has won popularity by tales of grotesque fancy and grim satire. He has lived in America, and his recent works are concerned with things American. The scene of his novel, "Das Rad" (S. Fischer), is laid in Chicago, and its environs, and the title is derived from the Ferris wheel.

A work possessing considerable interest is the volume of memoirs written by the late Austrian admiral and baron, the Dane Hans Birch Dahlerup, edited by his grandson, Joost Dahlerup, under the title of "Mit Livs Begivenheder" (The Happenings of My Life), and published by the Gyldendal Publishing House (Copenhagen and Chicago). The first volume, which has just appeared, deals mainly with the author's stay in Norwegian waters and seaports as a young lieutenant of the navy during the wars of the early years of the nineteenth century, as well as his several sojourns at Portsmouth, Reading, and other English towns as a prisoner of war. During two of these sojourns, he met and quite minutely (although far from favorably) characterizes "King Jörgensen" of Iceland. The memoirs abound in interesting references to contemporaneous social life of Denmark, Norway, and England. The author, even while an English prisoner of war, was offered an opportunity to serve as an English naval officer in the war of 1812 against the United States, but refused the commission. The next two volumes will refer mainly to the author's career in the Austrian naval service. The editor—a resident of New York city, by the way—is himself an author, having just issued through the same publishing house a novel, "For Vind og Vove" (A Prey to Wind and Waves).

The American Philological Association will hold its annual meeting at Toronto, December 28-30. The following is a list of the papers: "Influence of Meter on the Homeric Choice of Dissyllables," John A. Scott, Northwestern University; "Worship and Prayer among the Epicureans," George D. Hadzsits, University of Pennsylvania; "The

Metaphorical Use of *Pronuba*," Harold L. Cleasby, Syracuse University; "The Tonic Laws of Latin Prose and Verse," Thomas Fitz-Hugh, University of Virginia; "An Unpublished Portrait of Euripides," William N. Bates, University of Pennsylvania; "A Point in the Plot of 'Oedipus Tyrannus,'" T. D. Goodell, Yale; "The Recently Discovered Turfan Fragment of the Crucifixion," Herbert C. Tolman, Vanderbilt University; "The Puteanus Group of Manuscripts of the Third Decade of Livy," F. W. Shipley, Washington University, St. Louis; "Certain Numerals in the Greek Dramatic Hypotheses," Roy C. Flickinger, Northwestern; "Livy i, 26, and the *Supplicium de More Maiorum*," W. A. Oldfather, Northwestern; "The Britons in Latin Poetry," Richard M. Gummere, Haverford; "Comparisons and Illustrations in M. Aurelius," Curtis C. Bushnell, Syracuse; "The Reed in Greek Medicine," Campbell Bonner, University of Michigan; "The Satirical Element in Rutilius Numatianus," George D. Kellogg, Princeton; "The Use of the Œ-Diphthong in Plautus," A. R. Anderson, Princeton; "Roman Milestones and the *Capita Viarum*," Gordon J. Laing, University of Chicago; "Some Recent Contributions to the Study of Lucilius," Charles Knapp, Columbia; "Plato, 'Phædo' 66 B; Acts 26, 28," J. E. Harry, University of Cincinnati; "Individualistic Tendencies in the First Three Centuries of the Roman Empire," Clifford H. Moore, Harvard; "Latin Echoes of the Greek Bucolic Poets," Wilfred P. Mustard, Johns Hopkins; "*Virtus* and *Fortuna* in Certain Latin Writers," Kenneth C. M. Sills, Bowdoin; "A Greek Parallel to the Romance Adverb," Paul Shorey, University of Chicago; "The Limitations of a Certain Use of the Article," C. W. E. Miller, Johns Hopkins; "The Use of the Dactyl after an Initial Trochee in Greek Lyric Verse," E. H. Spieker, Johns Hopkins; "Dante's Designation of Virgil as 'il mar di tutto il senno,'" Kirby F. Smith, Johns Hopkins; "Note on Cicero, 'Ad Atticum' i, 6," W. S. Scarborough, Wilberforce University; "Polybius and the Gods," Hamilton F. Allen, University of Illinois; "Scholia on Terence," Edward K. Rand, Harvard; "Relative Standards in Science and in Syntax," William Gardner Hale, University of Chicago; annual president's address, Charles E. Bennett, Cornell.

The next annual meeting of the American Jewish Historical Society will be held in Philadelphia February 21 and 22. All persons intending to present papers to be read at the meeting are requested to present the titles to Max J. Kohler, corresponding secretary. No. 42 Broadway, New York.

William Ireland Knapp, a student of Spanish literature, died in Paris December 6 at the age of seventy-three. He was born in this city and educated at New York University and Colgate University; and he had taught modern languages at Colgate, Vassar, Yale, and the University of Chicago. Among his books are "The Earliest Decree on Printing" (1881), "Grammar of the Modern Spanish Language" (1882), "Modern Spanish Readings" (1883), "Modern French Readings" (1883), and "Life, Writings, and Correspondence of George Borrow" (2 vols., 1899); he had also edited four or five volumes of Spanish texts.

Anthony Stocker Aglen, archdeacon of the diocese of St. Andrews, died in London last month. He was born in Somersetshire in 1836, and was educated at University College, Oxford. Among his books are "Lessons in Old Testament History" (1890), and "Odes and 'Carmen Seculare' of Horace Translated" (1896). He edited a selection from the writings of Dean Stanley (1895), and contributed various articles to the "Encyclopædia Britannica," and Bishop Elliott's "Commentary on the Old Testament."

NOTES ON HOLIDAY BOOKS.

As Christmas approaches the world of books blossoms into flower as the world of nature does in May. And, like the fields in May, most of the books of travel and description mentioned below are profusely illustrated in color, and afford the searcher after holiday gifts an excellent opportunity to test the saying of Lipsius that "no man can be such a stick or stone whom that pleasant speculation of countries, cities, towns, rivers, will not affect." Reproductions in color of the work of the artist, while less faithful than photographs, possess the charm which belongs to art precisely because art is not nature. If one were sure to find the warmth and delicate beauty of the plate in the scene which it depicts, these books might well lead one to pack one's trunk without delay and to seek what Burton asserts is "the best, surest, and readiest cure of melancholy, *loci mutatio*." Maud Howe's (Mrs. Elliott's) "Sun and Shadow in Spain" chiefly illustrated from photographs, is for those who delight in the personally conducted tour. Associations of this kind are dangerous, whether in literature or life. In the former case, however, one can lay down a book without imperilling a friendship. Here the picture is painted with a lively imagination and an unfailing enthusiasm. Much of the information supplied by one of the party, who acts as a sort of Greek chorus, would be less wearisome if soberly stated as matter of fact. In the form presented it is as irritating as the loquaciousness of the typical guide. The text is disfigured by the constant use of exclamations and colloqualisms in Spanish. *Mire! claro! ojalá! pobrecito! se sabe! Por Dios!* are not so associated with the genius of the language as to defy translation. In Mr. Calvert's "Valladolid, Oviedo, Segovia, Zamora, Avila and Zaragoza: An Historical and Descriptive Account" (John Lane & Co.), as in the other books of the series, the numerous illustrations are found at the end of the text, which is chiefly historical in character. Unfortunately Spain has as yet done little to make available this region, rich in artistic treasures, which most travellers pass by for that "strip of Africa sewn on to the skirt of the Continent"—Andalucia. "Southern Spain" (The Macmillan Co.), also by Mr. Calvert, is devoted to this province, Murcia, and Valencia. The brush of Trevor Haddon has been successfully called upon to convey the tawny colors of the South, and to make this volume one of the most fascinating gift books of its kind.

The same may be said of "Belgium," painted by Amédée Forestier, text by George W. J. Omond (The Macmillan Co.); "The Rhine," by H. J. Mackinder, illustrated in color after Mrs. James Jardine (Dodd, Mead & Co.); and "Along the Rivieras of France and Italy," written and illustrated by Gordon Home (The Macmillan Co.). In these three works the pictorial glory is most alluring. They all betray the tendency to get away from the dust and smell of the motor into the quiet of valleys and villages untainted by this blessing and scourge of modern travel. Especially to be noted are the descriptions of that enticing but little visited region of the Meuse and Lesse in the Ardennes; of the eastern portion of the Italian Riviera, the Gulf of Spezia, Lerici, and Porto Venere. The by-ways of Europe are far from exhausted, and often lie close to the highway over which we rush so hurriedly. Excellent maps supplement Mr. Mackinder's "Rhine," together with skeleton sketches of its tributary systems. Taken together, much sameness necessarily prevades books of this class, but in the beauty and variety of their illustrations they will commend themseves to all intending travellers, as well as to those who desire to refresh the memories of past wanderings.

Of a somewhat different character is Francis Gribbie's "Geneva" (Macmillan), in which description gives place frankly to history and anecdote. Mr. Gribble has already proved his familiarity with the country by his "Lake Geneva and Its Literary Landmarks," and he here traverses some of the same religious ground. The present volume is entertaining, but would have been more of a unit if, in such chapters as those on Ferney and Coppet, he had told more of the places and less of their famous owners. The illustrations are from paintings by J. Hardwicke Lewis and May Hardwicke Lewis, fair work but a little lacking in distinction. "Switzerland" as a whole receives attention in a book of that title (Dodd, Mead & Co.), containing descriptions of the land by various great writers selected by Esther Singleton. It is illustrated with abundance of photographic scenes clearly printed. Miss Singleton's method of composing these books is now so well known as to need no special comment. Besides the "Switzerland" she has this year a volume of "Great Rivers," in which one passes from the Rhine as seen by Victor Hugo to Pierre Loti's Ganges, Thoreau's Merrimack, Henry Drummond's Zambesi, and so over the famous waters of the world.

Four of the picture books have to do with English scenes. One of them belongs to the now extensive series published by Black and Macmillan, and presents "Yorkshire" painted and described by Gordon Home. The work appeared originally in three volumes, devoted respectively to "Coast and Moorland Scenes," "Dales and Fells," and "Vales and Wolds," and these are now brought together with what corrections have proved necessary. Mr. Home's text is chiefly descriptive, and suffers a little from the monotony due to such writing and from an uncertain taste when the purple patches are in order. His pictures are more to our liking. He has caught the tints of heather and gorse, and he has put distance into his scenes of moor and wold, without which the land of Yorkshire would lose its character. Even better, if anything are the views along the rocky coasts. The picture called Whitby Abbey from the Cliffs is a particularly good example of his skill in reproducing the sense of space and loneliness. Of a

different type is a volume on "The Greater Abbeys of England" (Dodd, Mead & Co.), by Abbot Gasquet, which is chiefly historical. Abbot Gasquet writes, of course, from a strongly Catholic point of view. The Visitors of Crumwell (to use the spelling he affects) were a set of vile spies, who took no evidence and had no regard for truth. That may be true, but it is not fair to slur over the fact that they probably did nothing more than bring to a focus, and no doubt exaggerate, the popular scandal about institutions which were ceasing to fulfil their original economic function. Disputed points of history have, however, little part in the author's chapters. The stories of the various abbeys are told in good English and with the same ripeness of knowledge as in his other works on the subject. The illustrations, by Warwick Goble, suffer in many cases from blurring, as is so common in these colored plates. The interior scenes, those of Westminster, for example, are more successful than the landscapes. An uncommonly handsome book is "The American Pilgrim's Way in England, to Homes and Memorials of the Founders of Virginia, the New England States, and Pennsylvania, the Universities of Harvard and Yale, the First President of the United States, and Other Illustrious Americans," by Marcus B. Huish (London: The Fine Art Society; New York: Max Williams). The frontispiece is a map showing the old homes of the Washingtons, the Franklins, the Calverts, the leading families of early New England, of John Harvard, Elihu Yale, and many more. The text describes these places and gives more or less about the various families which have played such an important part in American history. The feature of the work, however, is the illustrations. The text contains nearly one hundred black and white pictures of churches, castles, houses, tombs, brasses, and other memorials, as well as portraits. The forty-three full pages in color, reproduced from paintings by Miss Elizabeth M. Chettle, are admirably done. Both the execution of the original and the printing for the book are better than the common run of such work.

Under the ambitious title "Gardens of England" (The Macmillan Co.) twenty paintings by Miss Beatrice Parsons have been made the basis of a pleasant treatise on gardening by E. T. Cook. The paintings are considerably above the average in point of merit, and they have been well reproduced in color with careful printing. As in most cases of this kind, the text prepared for general reading does not describe the pictures, but, for all that, the chapters on the herb-garden, and on lavender and rosemary are pleasant reading for the winter, and are about as good as if they had illustrations to match; while, on the other hand, the pictures are very good without any specific description. It is not easy to find much uninteresting matter in any of the modern illustrated garden books, for, in spite of an endless amount of repetition and frequent disfigurement by fine writing, a certain charm persists. The volume before us is attractive in its style and sound in its advice.

Cecil Headlam has a happy knack of making books about places in which he mingles history and art with scenery and personal impressions. He has already written about Oxford, Nuremberg, and Chartres: this year his subject is "Venetia and Northern Italy: Being the Story of Venice, Lombardy, and Emilia" (The Macmillan Co.). Readers already familiar with the chief cities and paintings will find this volume interesting because it takes up many of the minor places—Pavia and Piacenza, Parma and Modena, and the smaller towns of Venetia and of the Marches. Mr. Headlam describes as an eye-witness, and he relies upon the best English authorities for his brief historical surveys. Ruskin and Symonds supply him with the bases of his art criticism, but he still reserves the right of private judgment. The general impression he makes is that of an intelligent and sympathetic companion, who never discourses long enough on any subject to weary his hearers. Quantitatively, he seems to succeed in imparting a larger number of facts than is usual in books of this kind. There are twenty-five full-page illustrations in color, of varying excellence. The view of S. Apollinare in Classe, for instance, has much to commend it, while in some of the others one color crudely predominates. The shadows—as in the Paduan view (p. 240) or St. Mark's (p. 268) or Milan Cathedral (p. 64)—are sometimes unmanageable. On the whole, however, most readers prefer crude colors to black and white.

Vernon Lee has consented to the reprinting in an *édition de luxe* of her "Studies of the Eighteenth Century in Italy" (A. C. McClurg & Co.), which first appeared in 1880 and at once gave her a reputation. She has in nowise altered these delightful studies, which, she tells us in a characteristic preface, she wrote before she was twenty, and fears to reread lest she should be impelled to revise them beyond recognition. Miss Paget is quite right; they owe much of their charm to the enthusiasm, exuberance, and audacity of youth; and her youth, be it said, was precocious and intense beyond that of even girls of unusual intellectual forwardness. But the exuberance and verve will not wholly account for the lasting qualities of her studies She has hit on several important facts, and has so interpreted the eighteenth century—which it used to be the fashion to despise—that its true significance can be understood. Her account of the Arcadians, of Goldoni and of Metastasio, of the musical life and the comedy of masks, is still the best in English; we could not wish to have it chilled by revision, or her literary and artistic judgments flattened out to fit her knowledge at fifty, or her glowing, galloping style checked in either heat or speed. Correctness, orthodoxy, can be had for the asking at any academic counter; Miss Paget deals in something better. Her book has been beautifully illustrated by a large number of portraits, facsimiles, and views, which give to it a worthy historical setting.

If the old world were not generally more attractive than the new, and the works of man than those of nature, Mr. Reeves's charmingly illustrated and informing account of New Zealand would tempt one to take immediate passage for that land of alp, fiord, and geyser: "New Zealand," painted by F. and W. Wright, described by the Hon. William Pember Reeves. High Commissioner for New Zealand (The Macmillan Co.). The scenery of New Zealand may fairly challenge comparison with that of Switzerland, the lower snowline fully making up for the disparity in elevation. Especially interesting are the chapters on sport and country life, and much light is thrown on the social conditions which, Keir Hardie asserts, have established a standard of comfort and a recognition of the rights of labor which make New Zealand the most desirable of all countries for the emigrant workman.

This season of the year always brings out a number of reprints designed by form and illustration for gifts. If the more handsome books of this kind are less conspicuous than last year, there are a number more suitable for moderate purses and perhaps for the actual reader. Thus the J. B. Lippincott Company has an edition of Sterne's "Sentimental Journey," which is as attractive as it is practical. The illustrations by T. H. Robinson, somewhat in the style of Hugh Thomson, harmonize admirably with the text. Another volume of the same character is Jane Austen's "Mansfield Park," in the Series of English Idylls (E. P. Dutton & Co.). The illustrations, to the number of twenty-four, are full-page colored plates by C. E. Brock. They are pretty and in keeping with the story, but the highly-glazed inset pages are an interruption to the reading rather than a pleasant accompaniment such as is afforded by ordinary line drawings. Of a different kind is Harper's Doone-land edition of "Lorna Doone," in which the actual country of Blackmore's story is kept before the eye by reproductions of photographs. Of more holiday aspect is "The Chariot Race from Ben Hur," printed separately by Harpers, with three or four strongly designed pictures by Sigismond Ivanowski. The colors have come out rather better than usual in these reproductions. With this book may be placed a volume containing seven of the better-known "Tales by Edgar Allan Poe" (Duffield & Co.), to which E. L. Blumenschein has contributed full-page plates, somber in color, and, if truth must be told, a little muddy in effect. The letter-press is clear and excellent. The most artistic of these reprinted books is Aldrich's "Marjorie Daw," which Houghton Mifflin Co. has brought out for the first time in separate book form. John Cecil Clay has furnished a series of quite charming pictures and decorations in the vein of Aldrich's peculiar humor. To this list we may also add three volumes of Scott (J. B. Lippincott Co.): "The Talisman," with pictures by Simon Harmon Vedder; "Kenilworth," by Henry J. Ford, and "Ivanhoe," by Maurice Greiffenhagen. Each artist has supplied twelve colored illustrations. The the volumes, which are handsomely printed in large type, contain glossaries as well as Scott's introductions and notes; and the Hon. Mrs. Maxwell-Scott of Abbotsford has written brief prefaces. We should be glad to see all the Waverley novels issued in this attractive style. Another favorite novel is Mrs. Gaskell's "Cousin Phillis," with which George Bell & Sons begin the Queen's Treasures Series. The second volume is Mrs. Ewing's "Six to Sixteen." For both books Miss M. V. Wheelhouse has provided illustrations in color, all of them happily conceived and executed. Henry D. Thoreau's "Cape Cod,"

with more than thirty pictures in black and white by Wilton Johnson, comes from Thomas Y. Crowell & Co. Most of the pictures appear to be half-tone engravings from well chosen photographs.

"The Little Flowers of St. Assisi" in T. W. Arnold's translation, with a preface by Dr. Guido Biagi of the Laurentian Library, Florence, comes to us from Duffield & Co. The volume, which is well printed and bound, is profusely illustrated, both in color and black and white, with reproductions of old and new pictures, and manuscript illuminations relative to St. Francis. These illustrations convey very happily the mediæval atmosphere. With this book we may also place "The Confessions of S. Augustine" (E. P. Dutton & Co.) in Dr. E. B. Pusey's translation. Paper and press-work are both uncommonly good. The frontispiece, title, and table of contents are printed in color—miniatures and illuminated borders adapted by Miss E. A. Ibbs from manuscripts in the British Museum, and in the Bibliothèque National, Paris.

With these illustrated books should be mentioned several excellent reprints which may be none the less acceptable because they lack pictures. Thus, Thomas Whittaker has a neat and cheap edition of Herbert's "Priest to the Temple," with a commendation and brief notes by Joseph Blount Cheshire, bishop of North Carolina. Lovers of Herbert will respond to the editor's story of the influence upon his life from a chance reading of this prose treatise when he was "thirty-five years ago a 'briefless barrister' in a great city, with no special intentions towards the ministry." A neat pamphlet for those who love the preaching of art has been made at the Marion Press for Ernest Dressel North of this city, containing Whistler's "Ten O'Clock," which has long been out of print. Here we have Whistler in his mood of ecstatic Emersonianism:

> The master stands in no relation to the moment at which he occurs—a monument of isolation—hinting at sadness—having no part in the progress of his fellow men.
> So Art is limited to the infinite, and beginning there cannot progress.

Emerson himself is present in the Thumb-Nail Series of the Century Company, his three essays on "Power," "Success," and "Greatness" being included in a volume, with an introduction by Richard Watson Gilder. Another volume contains the "Odes, Sonnets, and Lyrics" of Keats. This series, now well known to the connoisseur, shows the daintiest work of the De Vinne Press. In poetry there are two other reprints that deserve notice: One is Longfellow's "Poems of New England," issued by Houghton Mifflin Company in limp covers in what may be called satchel form. It is an anthology that has never lost its popularity. The other is "King Solomon and the Fair Shulamite," published by Frederic Fairchild Sherman. The text, printed in verse form, is arranged by Julia Ellsworth Ford from King James's version of the Song of Songs, with use of the revised version where this has seemed better to preserve the continuity of the story. The illustrations are from the early work of Simeon Solomon.

A delightful bit of fooling is the little book of rhymes and quaint woodcuts by Robert Seaver, called "Ye Butcher, Ye Baker, Ye Candlestick-maker" (Houghton Mifflin Company). Mr. Seaver in his pictures has caught the spirit of the old chap-books admirably. The rhymes get their humor from the modern application at the close, as thus:

> Ye tallow chandler in his shop,
> He makes ye tallow dip,
> And cuts ye wicks and fills ye moulds,
> Ye while he drinks his flip.
> Full many a studious gentleman
> Doth hie him forth to buy:
> Ye lamp of knowledge at his shop,
> Is here for all to try.
> So works ye tallow-chandler,
> Nor wotteth that he must,
> In modern days, give up his ways
> To Midnight Oil, their Trust.

THE HOLY CITY.

Jerusalem: The Topography, Economics, and History from the Earliest Times to A. D. 70. By George Adam Smith 2 vols. New York: A. C. Armstrong & Son. $7.50 net.

The value of these volumes lies, not in the presentation of new discoveries, but in the sane exposition and discussion of what we already know with regard to the topography, the archæology, and the history, religious, social, and political, of Jerusalem. The work is a sort of thesaurus of information, from the earliest times down to the capture and destruction of the city by the Romans, arranged in a readable and attractive manner. To the Bible student it presents, in relatively small compass, a handy commentary on the Bible, both the canonical books and the Apocrypha, and on Josephus as well.

The great importance of Jerusalem to the world, despite its insignificance in size and political power, is brought out in Professor Smith's introductory chapter, "The Essential City." There he pictures not only the "ceaseless human strife" but also that strife between the Spirit of God and the spirit of man, in which "the real tragedy of Jerusalem has consisted":

> Nowhere else has the universal struggle been waged so consciously, so articulately as in Jerusalem. Nowhere else have its human responsibilities and its Divine opportunities been so tragically developed (Vol. I, p. 5).

The fact that God and man have been so intimately and so tragically brought together, if one may so express it, in Jerusalem, has made the religious development which centres about that spot the source of vital inspiration to the most progressive, cultivated, and thoughtful part of the earth's population. Three great religions call the city sacred, a record which no other city can show. This is the secret of the perennial interest which attaches to its otherwise rather dry annals. The place is undesirable and actually repellent in its surroundings, with no ruins of artistic merit, yet its topography, its geology, its archæology, and its political chronicles are matters of intense concern to millions of people.

Always before the eyes of men, the subject of innumerable books, its name familiar to more people probably than that of any other one place, Jerusalem is yet, in itself, comparatively little known. The records of it contained in the Bible, which have been the heritage of the ages, have undergone such a re-examination in recent years that even from this point of view we are seemingly only beginning to study Jerusalem. The new critical methods, which have changed so profoundly our conceptions of all ancient civilization, have nowhere produced such a revolution as here, because, in the case of Jerusalem, the earlier interpretations of its history had come to be regarded as themselves sacred. Both metaphorically and physically, ancient Jerusalem has been buried under the accumulations of the succeeding centuries, the traditions and the ruins of Roman, Greek, Moslem, and Frank. Valleys were filled up and hills cut down, until the whole became almost a dead level covered with modern structures perpetuating fable and concealing fact. While religious fancy busied itself with the sites and the story of the past, there was but little actual scientific exploration, and that only on the outskirts, as it were.

We are just beginning to restore the early Jerusalem, but thus far our investigations have tended in many respects to increase the confusion rather than to afford certainty. In the matter of the water supply, for example, traces are found of conduits leading from we know not what sources and emptying into we know not what reservoirs. A considerable number of old reservoirs and pools have been unearthed, but almost none are surely identified with ancient names or dates. Into this subject Professor Smith introduces a new element of perplexity by his suggestion (Book i, Chapters 4 and 5) that seismic changes may have closed up springs once in existence and opened others. Personally, we do not think that this suggestion carries us anywhere, and we are glad to see that, in spite of this new uncertainty, Professor Smith himself is convinced that the Virgin's Spring, the intermittent water source on the west side of the Kedron Valley, opposite the village of Siloam, has remained practically unchanged, and that he accepts the now generally received identification of this spring and pool with the Gihon of the Bible. This identification affords a starting point in his topographical study, and, to some extent, the key to that topography. It is fairly clear that the original city must have been situated near a permanent supply of water, and this spring appears to afford the only supply of that description. The early passages and tunnels by which this spring was made accessible to the hill above testify also to

an intimate connection between it and some fortified place above and behind it. From this and other considerations it would seem that the original town actually stood on the crest of the hill Ophel, immediately above this spring. Here also stood the Acra, or citadel of the Antiochian period, on a hump of the hill supposed to have been cut down later; but this identification encounters serious difficulties, and until the site can be excavated it must be regarded only as a working hypothesis.

As with the water supply, so in the case of the walls, Professor Smith, by the very clarity of his statements, only makes more evident the uncertainty which exists. We know substantially the course of the eastern and the western walls, at least after both of the greater hills were included in the fortifications; and one, probably two, of the great towers of Herod can be identified with certainty. Indeed, the lower part of one of these towers still serves as the foundation of the Turkish citadel. On the south, also, the line of the wall has been traced; but from the edge of the Tyropœon valley eastward the line exhibits so many variants that we are as yet unable to determine what was enclosed at different periods. On the north there has been practically no exploration, although with the fixing of the wall on that side is connected the burning question of the site of the Holy Sepulchre. Here, with the best scholars of the present time, Professor Smith wisely refuses to commit himself.

Professor Sanday and others believe that the site of the house where the Last Supper was held, and where the first followers of Christ were wont to gather in an upper room, as determined by early tradition, which can be traced to contemporary sources, was at the present "Tomb of David," outside of the gate of Zion, south of the city. This theory Professor Smith flouts, arguing that there is no satisfactory evidence for that identification or any other. In fact, so far as specific sites are concerned, with the exception of the Temple, the Tower of Antonia, the Tyropœon valley, Gihon, and one or two of Herod's Towers, it would seem that we do not really know where anything stood in ancient Jerusalem, a conclusion most disappointing to those who wish to visit the particular spots where the great events recorded in the Bible took place. It must not be supposed, however, that in spite of this vagueness as to various details it is impossible to restore a fairly vivid picture of Jerusalem in the successive stages of its progress. This Professor Smith has endeavored to do, and, to a considerable extent, has done successfully in the first book.

This study of topography forced upon his mind the economic problems of Jerusalem, which "run through every phase of her ethics and politics." How large was the city? How did this population and the vastly greater numbers which gathered there in festival times subsist? Situated disadvantageously, as Jerusalem is, both for agriculture and for commerce, how did she obtain the necessaries of life? Starting with the intention of writing a chapter on the material resources of Jerusalem. Professor Smith developed this theme into a book of ten chapters, the second part of Volume I. In this field Professor Smith is one of the pioneers; and therefore, valuable as his discussion is, he feels that the has not spoken the last word.

Probably the most valuable, certainly to the ordinary reader the most interesting, part of the whole work, is Book iii, comprising the whole of Volume II, which treats the "political and religious history of Israel from the time when with David the city was first identified with the fortunes of the people, to that of Titus when such an identification came to an end." At first a political capital, Jerusalem became, by the erection of Solomon's Temple, also a religious capital. It was not, however, the real centre of the Jewish religion, the sacred city of the faith, until the promulgation of the law under Josiah, in 621 B. C., when "vivid sympathy . . . for the whole land . . . was replaced by a fanaticism for the temple and the city." Especially conversant with the religious development of the Jews in and around Jerusalem and its temple, Professor Smith is at his very best when he deals not with the legal and ritual, but with the prophetical side of this development—as might be expected from one who first became famous as a commentator on Isaiah and the minor prophets. Technically, an Old Testament scholar, Professor Smith also introduces a fresh element into the study of Jerusalem in the Gospel period and sounds a wholesome note of warning with regard to the relation of the Christian religion and its founder to the Old Testament religion, pointing out that Christ and that side of the popular religion with which He was in touch, connected directly with the ancient prophetism rather than with the late apocalyptic developments or with the legal and ritual religion of the time.

Considerable portions of Books i and iii, the topography and the history, had already appeared in the *Expositor* and elsewhere, and have undergone scholarly criticism. The larger part of Book ii, economics and politics, is here published for the first time. The work is satisfactorily provided with maps and charts, including a large pocket plan of the city, based, by permission of the Palestine Exploration Fund, on Sir Charles Wilson's ordnance plan; a geological map, founded on the material collected by Dr. Blanckenhorn for the Deutscher Palästina Verein (the maps were prepared by J. G. Bartholomew); and some fifteen admirable reproductions, almost entirely from Professor Smith's own photographs. There is a general index to each volume, with special indexes of passages referred to in the Bible, the Apocrypha, Josephus, and the Talmud.

Lynch's Daughter. By Leonard Merrick. New York: The McClure Co.

Here is a story turning on the subject of tainted money, although it does not flaunt that hackneyed phrase. Old Lynch was a piratical financier, and his hundred millions were made by grinding the faces of the poor. Therefore his daughter Betty, greatly to be desired in herself, became an impossibility for Richard Keith, an English artist. He could not bring himself to profit by a tyranny that had always "horrified and revolted" him. Equally scrupulous was he as to the aims and uses of his own profession. "I don't think one is entitled to fritter away either one's wealth or one's art," he said. Though reasonably successful at portrait-painting, he aspired to do symbolic work, which, less rewarding pecuniarily, should better satisfy his ideal of giving to art and to his country the noblest that in him lay. Thus, with conscience opposed both to his own best chances of making money, and to the acceptance of it from the objectionable Lynch, his love affair with Betty would undoubtedly have been strangled by him, had not Betty herself taken a hand and convinced him that she was equal to the rôle of a poor man's wife.

The marriage takes place early in the book. The story is of struggle, incapacity, wavering and broken faith, bitter lessons, and a triumphant outcome. Though the opening menace of the novel is that it shall be a pamphlet on Trust methods and idealism in art, it passes happily on into the lighter, brighter airs of a married love-story, and may be read without dread and with pleasure.

Ganton & Co. By Arthur J. Eddy. Chicago: A. C. McClurg & Co.

It is remarkable how little either of distinction or of crude force belongs to the current American stories of this type. The situation they try to portray is pregnant enough: it is the situation with which we are all deeply concerned just now. The old multi-millionaire of simple personal habits and endless greed of power; the young man, spoiled by wealth, given to fast society, impatient of work, and destined in the natural course of things to become a mere squanderer; the problem of protecting "labor" from the tyranny of un-

scrupulous capital and the tyranny of equally unscrupulous demagogy—these are matters which occupy our thoughts. Yet we seem to be able merely to talk about them. The novel or play embodying them, as a strong art should be able to embody them, is still to be written. Mr. Eddy offers us a book much like a dozen others we recall during the past two years. Old John Ganton is the familiar figure of the unscrupulous and successful commercial tyrant. His financial operations smell to heaven like the vast stock-yards upon which they are founded. But he has few accusers and fewer qualms. The making of money is a game, the rules of which he takes to be as liberal as those of love and war. But the present game is, after all, of the author's playing, and old Ganton is merely the chessman predestined to his part. The son, the society people, the labor leaders, are yet more wooden figures, conventional presentments of the types with which our energetic press has abundantly acquainted us. Nowhere is there a touch of that sublimation of the type, that precipitation of the familiar experience which may some day, let us hope, give permanence to their literary record. "Ganton & Co." is not a hopelessly bad novel; it has merely come to swell our ever-increasing store of the unhopefully mediocre.

The Gentleman. By Alfred Ollivant. New York: The Macmillan Co.

Take three parts of Stevenson to one of Charles Kingsley, flavor with reminiscences of Blackmore, beat violently, and serve in paragraphs *à la* Charles Reade—such seems to have been the formula for this rather extraordinary book. That Mr. Ollivant knows how to write no one that has read "Bob, Son of Battle" will deny; at his best he really has style; his words are admirably chosen and seem to impinge directly, even painfully, upon the reader's senses. This powerful realism is here applied, for the most part, to scenes of carnage and horror, yet it is redeemed from the lower deeps of brutality by the atmosphere of romance which the author can throw about his most gruesome incidents. Partly, too, it is saved from being unbearable by the breathless rapidity with which one life-and-death struggle follows another. So dizzying is the whirl of events that it is hard to believe how simple the plot really is—a desperate effort on one side to carry out and on the other to foil a scheme to betray Nelson into the hands of Napoleon, as he watches at Boulogne for his opportunity to invade England. Moreover, the scene is laid on a narrow strip of Sussex coast and the waters of the Channel immediately off-shore, and the entire action takes place in three or four days. Yet this classic severity of plan is so thickly overlaid with incident that the reader who has been able to "swim the sea of slaughter" as far as the latter half of the story can hardly remember the beginning. It is a pity, for the two heroes—Kit Caryll, a fifteen-year-old midshipman with the sensibility of a girl, the heart of a lion, and the resourcefulness of a genius, and the nameless "Gentleman," a Franco-Irishman, valiant and terrible, gentle and debonair, as any champion of mediæval romance—are really delightful figures, if they would only stand still long enough to be looked at.

The Long Arm of Mannister. By E. Phillips Oppenheim. Boston: Little, Brown & Co.

Here Mr. Phillips undertakes to show, in a thrilling succession of anecdotes, that the way of the transgressor is much harder than the Biblical aphorist dreamed it. He has succeeded remarkably. George Mannister, whose fortune and home nine dastardly conspirators have wrecked, sets forth to vengeance. Such is the benumbing power of guilt that his intended victims, London's cleverest sharpers, can do nothing but wait with chattering teeth for the "long arm" to seize them. One musters up strength enough to flee some distance—in vain, of course. But all the other eight linger in cafés and clubs, wondering fearfully when and how the blow shall fall upon the next of their number. Sometimes they piteously beg Mannister to hasten their doom, whereat the avenger assures them that he must take them in a certain order. The instinct of self-preservation does not warn them against accepting dinner invitations from their pursuer, riding with him through lonely streets at night, or confiding to his ear their business and social secrets. Every young man contemplating a career of crime, literary or otherwise, should read this tale and be warned.

Three of a Kind. By Richard Burton. Boston: Little, Brown & Co.

This is a story of "a man, a waif, and a dog." Its geography declares itself in the post of the newsboy, which was "hard by the Common, just where the little stations of the subway belch forth or swallow up the throngs of city folk." Its musical programme embraces "a selection from the Niebelungen," and a girl singer who "held the roughest, most careless element of her audiences spellbound by the freshness, the sweetness, and purity of her rendition of some familiar ballad like 'Annie Laurie' or 'The Last Rose of Summer.'" Concerning Christmas, it is learned that the simple and inexpensive gifts at a humble celebration "were productive of more merriment and went further to meet real human needs, than is often true of the perfunctory and impersonal present-making of those whose purse is plethoric." From this foot may it be learned that here is no Hercules. Saccarissa, rather, is the presiding divinity over a tale of long-lost loves and inlaid caskets, new-found letters and boys, attics with Spanish leather screens, and the sentiment that seems inseparable from stories with violins in them. Happily, a certain amount of sugar is wholesome, and there is here, besides, a good deal of good human nature in the old German musician; while the boy and the dog are very commendably real, the boy satisfactorily canine, the dog more than half boy, as nice boys and good dogs should be and are.

Two English Queens and Philip. By Martin Hume. Pp. xi.+498. New York. G. P. Putnam's Sons. $2.75 net.

Some of Major Hume's readers may note with alarm the brevity of the interval (less than one year) which has elapsed since the appearance of his "Court of Philip IV"; others will be stirred by anticipations, not untempered with apprehension, on learning that the present work is the first of a Romantic History Series under his general editorship; one and all, however, will join in congratulating him on the honorary M.A. which Cambridge University conferred upon him last June, and which is duly exhibited upon the title-page of his latest production. "Two English Queens and Philip" contains, in effect, a thoroughly readable popularization of the more romantic of the historical facts which are to be found in the most recent volumes of the Spanish Calendar. It begins with an account of the way in which the disappointed Emperor indemnified his beloved son for his loss of Germany, by marrying him to Mary Tudor, in the hope that this match might ultimately annex the English crown to Spain. It recounts in detail the successive disappointments of that hope, from the day when the patriotic Bishop of Winchester drafted the marriage treaty in such terms as to safeguard the liberties of England, through the tergiversations and jiltings by Elizabeth, to the initiation of active though indirect hostilities between the two countries, in the shape of English intervention in the Netherlands and Portugal, and Spanish plots in Ireland and Scotland. It closes with the execution of the Scottish Queen, the last of a chain of events which brought the two nations face to face in 1588, because, by removing the regular Catholic claimant to the English throne, it enabled Philip for the first time to strike a blow for his own land.

The field covered is naturally one in which Major Hume is specially competent. His editing of the Spanish Calendars has familiarized him with its details to an extent which no one else can boast, while his little Life of Philip II

(which the present reviewer ventures to think is by far the best book he has ever produced) shows an ability to treat it *en bloc*. Errors of detail in the present volume are surprisingly few, and the point of view is on the whole sound. Whether the policy expressed in the famous

> Con todo el mundo guerra
> Y paz con Inghalterra.

was as wise in theory or in practice as Major Hume would have us believe may well be doubted. There were many alternative possibilities open to the Spanish monarch; and competent critics have urged that in allowing the conflict, when once inevitable, to be postponed till the late eighties, he made a grave mistake: for every year saw Elizabeth more firmly seated on her throne, while Philip's power had passed its zenith in the seventies. A book like this, however, cannot be measured by the same canons as a serious historical work; it is frankly written to please a large public, and not for the instruction of specialists. It is no sinecure to popularize further a period that has already been treated by Froude, but there are not many persons living today who are better fitted to do so than Major Hume. We venture to think that in works like this he has found his real vocation, and, provided his readers are adequately warned not to accept all his statements unreservedly, we trust he may continue to live to produce a great many more.

The Childhood of Man. By Leo Frobenius; translated by A. H. Keane. Philadelphia: J. B. Lippincott Co. $3 net.

Dr. Frobenius has spent many years in collecting material illustrative of the arts and crafts and religious ideas of barbarous races, and has made his home into a museum somewhat similar to that founded by the late Gen. Pitt-Rivers in Oxford. In this volume he has brought together a number of more or less interesting facts gathered partly from personal observation, partly from the private communications of eye-witnesses and from published works. In a succession of chapters he talks of adornment, tattooing, tests of manhood, the communication of ideas by dress, gestures, drums; and pictures of funeral ceremonies, worship of skulls and ancestors, the adventures of the souls of the dead, the origin of the world, the theft of fire, the stone and iron ages, cannibals, and war. Of all these things he discourses in a lively and familiar way, with many shrewd observations. Not much of what he communicates is new, but his treatment of his subjects is fresh and suggestive. Besides the numerous illustrations furnished by the author, this English edition contains reproductions of some rare water-colors taken from the volume of drawings executed by John White, who was made Governor of Virginia by Sir Walter Raleigh in 1587.

Frobenius is less happy in his interpretation of savage customs than in his accumulation of facts. His chief contribution to mythology is found in his statement (p. 331, ff) that the whole history of the faculty possessed by rude peoples of comprehending the world is clear as soon as we recognize their three periods of development: animalism (the age of esteem for animals), manism (the age when the power of departed souls [*manes*] was dominant), and solarism (the contemplation of the universe). It is in solarism that he finds the key to many early ideas and ceremonies: the rising and setting of the sun explain the numerous stories of man's climbing up to the sky by trees, ladders, and spider-webs; the descent of gods or men to the underworld, fire-worship, the "Jonah-myths" in which a person, human or divine, swallowed by a marine monster, emerges from his prison, usually by cutting his way out; the widely distributed conception that heaven and earth formerly lay together and that heaven was lifted up, generally by violence, to its present position; and the journey of the souls of the dead along a path which is the path of the sun. Most of these conceptions, however, admit of simpler explanations: it is a natural fancy to climb to the sky or descend to the underworld; naturally, the sky must have been pushed up to its present place; the Jonah type of story might easily suggest itself to dwellers by the sea; fire is worshipped because it is bright and powerful. As for the journey of the soul, it is conceived of in many ways, and these are usually imitations of earthly journeys. The worship of the sun and moon in very early times and the worship of the stars at a later time have been widely diffused; but Frobenius has used his "solarism" in a way not warranted by the facts.

Carla Wenckebach, Pioneer. By Margarethe Müller. Pp. xiv—290; 7 portraits. Boston: Ginn & Co. $1.00.

In August, 1879, Anna Doris Amalie Katharine Wenckebach, known to hundreds of Wellesley students as Carla, landed in New York, engaged to serve as governess in the family of a wealthy merchant of North German birth. For three years she taught seven hours a day, besides contributing gratuitous articles to the *Staats-Zeitung*. Then, after a period of discouraging struggle with the problem of self-support, she went to the Summer School at Amherst, where she attracted the attention of President Alice Freeman of Wellesley and was appointed head of the German department. In less than two years, she completely reorganized it. She herself did every grade of work from the most elementary to "Faust," in the senior year, often taught double time, and also prepared a series of text books, designed to forward "the new methods" of instruction in language. In less than a decade, she was hailed as "one of the most distinguished leaders in her field of work—the reform of language-teaching." She also started the department of pedagogy. And there, "the little Bismarck," as she was familiarly called, exerted her vivifying influence until her death in December, 1902. This was Carla Wenckebach's career in America. In the Fatherland, she is commemorated by a large bronze relief in the Hanover Seminary, where she was one of the pioneer graduates, with a teacher's diploma.

She was born in the ancient city of Hildesheim, in 1853. After graduating from the newly founded Hanover Normal School, she secured a position as governess in a family in Perthshire, Scotland. There, above all things, she detested the Scotch-English Sabbath, with its "pharisaical sanctimoniousness." She yearned for "the serenity and bliss of our Continental Sunday, with its summer joys of walks and garden concerts, and its winter cheer of home conviviality and theatre-going." After several vicissitudes, she became a governess in an officer's family in Tiflis. Her experiences here are among the most interesting in the book. She was the most naïve and unconventional figure that one could imagine. At first her quaint and inartistic dress might attract amused attention, but that was speedily forgotten, under the spell of her enthusiasm. A description of her, written by one of her friends and admirers, is worth quoting:

> I sat down opposite the professor, who had all this time been majestically enthroned on her high desk chair, her feet supported by an enormous hassock, her shapely hands resting on her knees. She wore a red velvet dress with a large flower pattern stamped on it, and a juvenile red sash around her waist; and she was sparkling with gold or some kind of yellow metal that glistened in her finger rings and bracelets, in her dress buttons and the beads used for a ruching. With bewilderment my eyes travelled down the length of her heavy gold chain, and up again from her waist to the enormous brooch—a gold dollar surrounded by spikes—to fasten at last on that wonderful square head of hers, with its crown of short blonde hair which bristled up over her fine brow like the crest of an alert bird. . . . In the course of the conversation I became more and more conscious that I was in the presence of a rare and powerful personality, and this impression of power, associated with Fräulein Wenckebach's strong neck and jaw, her fine, firm mouth, her determined chin, her habitually clenched fists, and her clear starlike gaze, almost drowns

the memory of her musical voice and of the gentle, graceful motions of her body.

The account of this remarkable woman's life is very interesting. One would scarcely suspect, but for Professor Müller's prefatory confession, that English was not the author's mother tongue.

Das deutsche Element in den Vereinigten Staaten unter besonderer Berücksichtigung seines politischen, ethischen, sozialen und erzieherischen Einflusses. Von Georg von Bosse. New York: Imported by Lemcke & Buechner.

This volume by a Lutheran pastor in Philadelphia is voluminous, almost encyclopædic, and yet it passes over or touches but lightly more than one name that might justly be allotted considerable space. The truth is, that the index is anything but complete, and many who are treated in the text find no place there. For example, Prof. Hugo Münsterberg and Karl Knortz. They, however, receive no more attention than some persons who have been identified with a particular neighborhood or local movement, perhaps long ago forgotten in the general story of German-American culture. The plates, too, seem somewhat capriciously chosen.

Having said this in slight disparagement of a work that sometimes partakes too much of the scrap-book, or at best of the heavy, prosaic *Arbeit*, we are glad to praise the positive merit of the book. It contains much valuable and interesting matter. Dr. von Bosse discusses the grounds for German emigration, looks from various sides at the value of the German emigrant, his ideals and his services, and examines the character of Germans of the colonial period, and the nature of their first settlements in New York, Pennsylvania, New Jersey, and New England. He gives one of the best records, since that offered us by George Washington Greene, of the considerable part played by Germans in the Revolution. He also tells the story of the Germans in the Civil, as well as in the Spanish-American war. One of the concluding chapters sets forth the relation of the German to his adopted land, and his achievements in politics, and his influence on the development of schools, music, literature, the theatre, and art. Naturally, such men as Carl Schurz and Richard Bartholdt receive their meed of praise, and recognition is accorded even to such native Americans as Prof. Calvin Thomas, who is credited to Michigan rather than Columbia. It could not be expected that the author should treat his theme with anything less than enthusiasm. Yet without any of the offensive phrases with which some German writers have sought to exalt German influence in America by decrying the Yankee and the men of other races, Von Bosse calmly states his belief that had the Germans not come to America in such numbers and when they did, and were they not of such sterling worth, the course of affairs here must have been far different. The great West would never have been conquered and developed in so short a time, the war of secession could not have been so quickly concluded, and the clarifying of America's political atmosphere must have been sadly delayed. Then, too, without the Germans, Americans would have remained longer in ignorance of good music, and American art would not have made such progress.

Science.

The New Physics and Its Evolution. By Lucien Poincaré. New York: D. Appleton & Co. $1.75 net.

The Radioactive Substances. By Walter Mackower. New York: D. Appleton & Co.

The Evolution of Forces. By Gustave Le Bon. New York: D. Appleton & Co.

The theories of physical science are undergoing profound modifications which are due to the discovery of cathode rays, X-rays, and radium. Those who are desirous of following these modifications can find no better treatise than that of Poincaré. Like most cultivated Frenchmen, he has a lucid style, which is maintained in the translation, and he has avoided mathematical language; for, as he says, "algebra is an admirable tongue, but there are many occasions where it can only be used with much discretion." The keynote of the book is the remark that physical science progresses by evolution rather than by revolution; and that science in general is in some sort a living organism which gives birth to an indefinite series of new beings which take the place of the old. The author shows how the science of mechanics, and the mechanical hypotheses of Newton, Descartes, and La Place have been modified by recent discoveries, and he explains the limits of metaphysics and philosophy in dealing with the laws of nature. The general reader is given in the space of three hundred pages an admirable résumé of the new theories in respect to electrons and the bearing of these theories upon the doctrine of a universal ether filling all space.

Since the discovery of radium a new subject called radioactivity has arisen. The literature in regard to it is already voluminous. Mr. Mackower's treatise will enable the general reader to form a good idea of the great progress made in this field during the past five years. His book is not so exhaustive as that of Prof. Ernest Rutherford, but it is simpler; and on reading it one can understand why certain physicists believe in the disintegration of the chemist's atom, and why our views of the cause and probable duration of the sun's heat and of the earth-heat may have to be modified. It can be studied with profit before taking up Dr. Le Bon's treatise in the same series.

In "The Evolution of Forces" Dr. Le Bon develops still further the idea which he first enunciated in a book entitled "L'Évolution de la matière" (1905), that all matter is continually in a state of dissociation and decay. This theory was received with great doubt by the scientific world; but the recent experiments with radium give surprising support to the contention of Dr. Le Bon, who certainly exhibits great originality and a powerful imagination. This imagination flashes forth in the following paragraph:

> During the accumulations of ages unknown to history, the millions of stars with which space is peopled must have begun or ended cycles of evolution analogous to that now pursued by our globe. Worlds peopled like ours, covered with flourishing cities, filled with the marvels of science and the arts, must have emerged from eternal night and returned thereto without leaving a trace behind them.

The author includes in this volume some very interesting experiments on light invisible to the eye which he terms black, or dark, light. These experiments, if substantiated, will contribute to our knowledge of phosphorescence.

As a supplement to "Religion and Medicine," by Elwood Worcester and Samuel McComb, Moffat Yard, & Co. will issue next spring "The Emmanuel Movement: Its Principles, Methods, and Results," by the same authors.

Longmans, Green, & Co. announce a three-volume work, "Design in Nature: Illustrated by Spiral and Other Arrangements in the Inorganic and Organic Kingdoms as Exemplified in Matter, Force, Life, Growth, Rhythms, etc., Especially in Crystals, Plants, and Animals," by J. Bell Pettigrew, late Chandos professor of medicine and anatomy in the University of St. Andrews.

The number of books on the fascinating subject of radio-telegraphy rapidly increases. C. C. F. Monckton's "Radio-Telegraphy" (D. Van Nostrand Co.), although not so complete as Prof. J. A. Fleming's work, gives the general reader a good account of the rapid progress in the new art of wireless telegraphy and wireless telephony. We learn that the first transatlantic wireless message was received in 1901, and since that time 119,445 words have been transmitted across the Atlantic by the wireless system; and the wave length used in transmission has been increased from 1,200 feet to 12,000 feet. Poulson, the Danish inventor, hopes to transmit speech across the Atlantic with only ten horsepower of radiated energy. Mr. Monckton is successful in making his exposition of the various systems of trans-

mission and reception, now in use, intelligible to the non-scientific reader.

In "Mind and Work," by Dr. Luther H. Gulick (Doubleday, Page & Co.), we have a refreshingly optimistic study of many subjects which will appeal not only to the teacher, but also to the layman. Nor is the writer's optimism of the irrational type that refuses to face the facts of experience. He neither overlooks nor underestimates the ills of human existence, but he teaches in a happy way the wisdom of choosing to minimize what is evil where it must be borne, and of avoiding it, so far as is wholesome, by sane precautionary action. His psychology is, in the main, sound, although his desire to express himself in colloquial language at times leads him astray. His indebtedness to Prof. William James, which is evident throughout the book, might well have been more often acknowledged; for the reader who is not thoroughly acquainted with psychological literature is not unlikely to attribute to the writer not a few teachings which are, in fact, mere paraphrases of James's brilliant suggestions—and this especially as the author's reference to other authorities is quite adequate.

Dr. Andrew J. McCosh, one of the leading surgeons of this city, died December 2 from injuries received by accident. He was born in Belfast, Ireland, in 1858, the son of James McCosh, afterwards president of Princeton. Having graduated from Princeton in 1877, he studied at the College of Physicians and Surgeons in this city, and afterwards in Vienna. Since 1889 he had been one of the surgeons at the Presbyterian Hospital in this city; he was professor of clinical surgery at Columbia University; and he was a frequent contributor to the medical journals and a member of various medical societies.

Drama.

Recollections and Reflections. By Ellen Terry. New York: The McClure Co.

This is an agreeable but disappointing volume: agreeable because characteristic in its butterfly style of one of the brightest personalities known to the modern stage; and disappointing because, abounding as it does in evidences of quick and shrewd observation, it is so comparatively poor in those revelations of close personal intimacies in which the memory of Miss Terry must be so rich. Her reflections are, as a rule, so sound and apt that the reader wishes for more of them; while the recollections, as is so often the case in theatrical biographies, are frequently so trivial, or so entirely professional in their interest, that they might have been compressed with advantage. Few persons could have known Henry Irving better, and yet of him, the man himself as apart from the actor and manager, she has little more to tell than Bram Stoker or Austin Brereton. Scarcely a hint is given of the intellectual, social, or personal attributes which won for him, in his private capacity, the friendship of statesmen, poets, scholars, and artists, secured him election to the most exclusive clubs and a reputation as one of the most accomplished hosts of his day.

Of Irving the actor she has many interesting things to say. She does not hesitate to intimate that her artistic instinct and equipment were superior to his in 1867, when she first played with him in Garrick's version of "The Taming of the Shrew." She saw in him then no sign of future greatness. For his part he thought her "hoydenish." In those days, as afterwards, she says, he thought and cared for nothing but the theatre, went hungry to buy a book or a stage jewel that might be useful, and awaking in the dead of night would strike matches to look at his new treasure. "He had it all in him," she says, "but could express very little. Many of his defects sprang from his not having been on the stage as a child. He was stiff with self-consciousness." This was after eleven years of hard work. What impressed her most in him was the suggestion of an indomitable will, and this," she adds, "was the peculiar quality in his acting afterwards—a kind of fine temper, like the purest steel, produced by the perpetual fight against difficulties." For years, she remarks, Irving's self gripped him like the shell of a lobster, but he overcame his dragging leg, his disregard of vowel sounds and other deficiencies by years of toil. At thirty, he was nervously sensitive to ridicule, with a touch of exaggeration in his carriage—"a dash of Werther, with a few flourishes of Jingle"—but ten years later, when he had "found himself" at the Lyceum, he had the quietness and confidence of the man of the world. He was, she goes on to say, an egotist "so absorbed in his own achievements that he was unable or unwilling to appreciate those of others." She never heard him speak in high terms of great foreign actors who visited England. "It was never any pleasure to him," she declares, "to see the acting of others." But, while saying these hard things, Miss Terry is a hot enthusiast for Irving's genius. She ranks him with Garrick and Edmund Kean. His Hamlet, she holds, had no equal, but she seems to regard Philip as his masterpiece. He confessed to her, she says, that he was hampered in the vehemence of passion. "He had to take refuge in speechless rage when he would have poured out his words in a torrent." So he failed comparatively in Othello and kindred characters. The more he felt, the more deliberate he became, and this tendency in his Shylock had a bad effect on her Portia, as his slow Benedick had on her Beatrice. Upon his conscientiousness, indefatigability, and comprehensive grasp as a manager, she dilates frequently. When he came to the first rehearsal of a new play, the whole representation, down to the smallest points, had been mapped out in his mind. At the last, he was warned by his physician that if he played Mathias again, it would be at the peril of his life. He played it and within forty-eight hours was dead.

Of herself, except when she prefers to maintain complete silence, Miss Terry talks with much frankness and with pleasant modesty. She prints, of course, some of the choicest tributes paid to her charm and ability, but she never poses as a genius, constantly insisting that her success was due not so much to any special gift as to the minute and laborious training to which she was subjected in early youth. It is not necessary to dwell upon these childish experiences, but the facts that she was drilled almost from infancy by her parents in the arts of speech and motion, and that it was the clearness of her utterance when she was eight years old which gained her the favor of Mrs. Charles Kean, are worth noting. She was with the Keans for three years, and has much to say about the exhausting rehearsals and their attention to details. Ever since those early days she has been a firm believer in the old stock company system as the only real school of acting, and evidently does not think that a player who is restricted by his individuality to one line of characters has much right to the title of actor. Looking back upon her youth, her conclusion is that the work then was harder, the pay less, and the actors better. Concerning her ill-considered marriage with George F. Watts she writes with regretful and dignified simplicity, without betraying anger or sense of injustice. She admits that the artistic and literary atmosphere which she breathed during that period of her life broadened her perceptions and improved her taste, and so was beneficial to her in her later theatrical career. She owed much to the constant criticism of the experienced Tom Taylor and the more brilliant Charles Reade. It was the latter who was for ever preaching the importance of pace in comedy, and her quick exits and entrances, her flashing deliveries and airy movements were largely the result of his admonitions. It was with him that she learned to appreciate the value of variety in intonation and gesture and in technique generally. It is for the lack of such training, she argues, that the new actor, whose individuality will carry him through a modern play, that has been written to fit him, is an utter failure in Shakespearean or old comedy parts.

The glimpses which Miss Terry affords of other persons do not add materially to common knowledge. Her account of her American tour is perfunctory and her closing chapters seem hasty and padded. The whole book would

be the better for judicious editing, but her gossip is suggestive of her own bright and impulsive personality, and doubtless will find many eager readers.

"A Mystery Play in Honor of the Nativity of Our Lord," by Robert Hugh Benson, with illustrations, appendices, and stage directions, will soon be issued by Longmans, Green & Co.

"The Maid's Forgiveness," by John Jay Chapman (Moffat, Yard & Co.), a play in three acts and eight scenes, is a bit of twelfth century romance, which possesses much literary merit and some effective theatrical qualities. It is written in blank verse and prose, and tells a somewhat fanciful, but interesting, story of a royal bigamist, his remorse, confession, and abdication, and the enthronement of his newly discovered heir in the place of the really illegitimate son, who had been accepted for twenty years as the crown prince. Both the plot and the construction are old-fashioned, but the characters of the two half-brothers—the one a gallant man of action and the other a fervent idealist, oppressed by the conviction of a wrong to be righted—are well and vigorously drawn. The dialogue is not only excellent in form—the blank verse especially showing careful study of the Elizabethans—but vigorous, picturesque, and imaginative in matter. The little piece—for it is short—would need some modification to make it suitable for stage presentment, but it is genuine poetic romance, and, if well acted, would be very effective. Unfortunately, romantic actors are now very scarce.

The twenty-third volume of the Materialien zur Kunde des älteren englischen Dramas (London: David Nutt) begins an edition of "John Fordes Dramatische Werke" in Neudruck herausgegeben von W. Bang. The present issue carries us through "The Louers Melancholy" and "Loues Sacrifice," with an appendix containing Dekker's "Penny-Wise, Pound Foolish." The text we may assume from the character of the series to be reproduced with great accuracy, and, though we may regard the reproduction of Ford's spelling and punctuation as a nuisance for all but the specialist in Elizabethan literature, we may grant its utility in a series designed for scholars. The notable feature of the book is an introductory study of "Ford's Contribution to the Decadence of the Drama," by Prof. Stuart P. Sherman, which has the rare merit in such scholastic productions of possessing real ideas. Professor Sherman shows how Ford went back for his inspiration to the earlier Elizabethan drama, feeling no sympathy with the new life that was then stirring in England. He felt, in fact, little sympathy with actual life of any date, but drew the world as it came to him already interpreted on the stage. It is notable in this respect that almost all his scenes, with the exception of "Perkin Warbeck," the least characteristic of his plays, take place within four walls; he has "nothing like the field of Agincourt, no Dover Cliff, no storm at sea, or wave-smitten coast, no Roman Forum, mountain cavern, barren heath, or forest of Arden." Masculine interests are almost entirely eliminated, and in their place is the curiosity of strange and unnatural passions. Here, again, the interest is not moral in the proper sense of the word, but psychological. Perhaps, the best paragraph in the introduction is that which analyzes Shakespeare's "Measure for Measure," and shows how this play, which leans toward decadence, yet lacks the true decadent stamp by its loyalty to convention and its avoidance of that questioning spirit which would have made Isabella weigh the value of preserving her chastity at the cost of her brother's life. One's only regret on closing this admirable study is that the author has not carried his argument into a more general discussion of decadence.

Music.

Stokes's Encyclopedia of Music. By L. J. de Bekker. New York: Frederick A. Stokes Co. $3.

The claim is made for this volume that it contains a wider variety and perhaps a greater number of topics than any other musical reference work. It certainly is remarkably comprehensive, condensing an enormous amount of well-sifted information into 743 pages. What strikes the examiner particularly, however, is, if we may use the word, its up-to-dateness. Here are articles on Oscar Hammerstein and his New York and Philadelphia opera houses; articles on the singers he has brought to this country, and the new operas they have sung; articles on the Metropolitan Opera House, its managers, past and present, its operas, and its singers, with the exception of Destinn. Seven columns are devoted, in addition, to the musical societies and activities of New York, while Boston, Chicago, Philadelphia, and other American, as well as foreign, cities are similarly treated. The leading American and foreign conservatories have articles including the names of the teachers, with other information not conveniently accessible elsewhere. Nor are the publishers forgotten. American names are much more fully represented in this one-volume dictionary than in the five-volume "Grove."

A novel feature consists in giving the principal achievements of each person of note in the musical world at once after the name. This bird's-eye view is then followed by a detailed biographic sketch and a list of works, which is usually complete; in the case of Edward MacDowell there are four columns of titles. Grieg, on the other hand, is unaccountably slighted. Only a few of his works are mentioned, and the article begins with the erroneous statement that the "Peer Gynt" music was first written for piano and afterwards developed for orchestra. And Grieg surely deserved more than a column in a book which devotes eleven columns to Mendelssohn, and which has room for nearly two columns regarding an obsolete opera like "Lucrezia Borgia," and gives the same amount of space to Berlioz's "Benvenuto Cellini," which is never sung in America and hardly ever in Europe. At the same time, the stories of the operas are among the most useful features of this book; they are well told, and all the recent productions, from "Thais" to "Tiefland," are included. The author draws the line at "Salome," which is disposed of with the words that "the text is the obscure production of a decadent genius, and morbidly decadent rather than biblical"; in this one case the temptation was evidently too great to allow the writer to adhere to his principle of making his book "a record of fact and not of opinion." The technical and historic articles, such as "Acoustics," "Singing," "Opera," are lucid and usually satisfactory, but both "Symphonic Poem" and "Symphony" called for fuller treatment. Among the abbreviations, "ten." for "tenor" seems uncalled for and disturbing. Apart from such details, the Stokes "Encyclopedia" calls for the highest praise; as a modern supplement to other musical dictionaries it is indispensable in every public or private library.

Before Oscar Hammerstein made the bold and unexpectedly successful attempt to produce "Pelléas et Mélisande" at his Manhattan Opera House, Debussy's opera had been tabooed by timid managers of both continents Since this achievement, it has been accepted and staged at a number of German and Italian opera houses. By way of commemorating tbis triumph, Thomas Y. Crowell & Co. have brought out an édition de luxe of Maeterlinck's play, on which the opera is based, with colored margins, pictures of Mary Garden, Maeterlinck, Debussy, and a number of scenes from the opera. The translation is by Erving Winslow and there is also a long introduction by Montrose J. Moses, who concludes that this opera marks merely a transition stage in the development of Debussy's style, as the play did in Maeterlinck's, and who predicts that in the years to come the "Pelléas" score will take its place with the countless operas of "Francesca da Rimini," now forgotten. Perhaps it will; but at present it is popular, wherefore this book will be welcomed by many who have seen, or intend to see, the opera.

Wassily Safonoff has selected for the third pair of concerts of the Philharmonic Society to be given on Friday afternoon and Saturday evening at Carnegie Hall a programme consisting wholly of the works of composers of Slavic birth. A novelty in its present form is Smetana's "Ultava," the second of a series of four symphonic poems in a group called "My Fatherland." This composition has been in part rewritten by Mr. Safonoff. Joseph Lhévinne, who is to be the soloist at these concerts, will play for the first time here Rubinstein's fantasy for piano in C major, which is an extremely difficult and complicated work. Tchaikovsky's symphony in B minor after Byron's "Manfred," which will serve to show to the best advantage Mr. Safonoff's characteristic interpretation of this Russian composer, will conclude the programme.

Art.

Seven Centuries of Lace. By Mrs. J. H. Pollen. New York: The Macmillan Co. $9 net.

Chats on Old Lace and Needlework. By Mrs. Emily Leigh Lowes. New York: Frederick A. Stokes Co. $2.

As inheritor of the La Primaudaye lace collection and wife of the official editor of the South Kensington Museum Catalogue of Books on Art, Mrs. Pollen has had unusual opportunities for the mastery of her subject, and "Seven Centuries of Lace" might be expected to bring to light much new material. It is a disappointment, therefore, to find that the text preceding her fine photographs contains little in the way of historical information, and that a disproportionate part of it is given over to a discussion of the gammadion as employed in lace design and an effort to show that laces commonly assigned to the fifteenth and sixteenth centuries may be correctly placed at a much earlier date. She believes that the geometric character of primitive design was modified earlier than is generally supposed, and she fortifies her theory by such argument as this:

> We find in an eighth century "Gospel" in the Bibliothèque Nationale of Paris, a scroll ornament painted with vine leaves, grapes, etc. Why should not this have inspired a lace worker of the same period to attempt a similar design? At a little later date a "Sacramentaire" has most realistic flowers and leaves ornamenting the initials in the Manuscript. These beautiful works of art were executed by religious persons and monks probably of the Benedictine Order. A great part of the lace made at the same time was undoubtedly the work of nuns. What more likely than that mutual assistance was given to carry out the principal aim of both—the ornamentation and glory of the Sacred Scriptures, and the services of the Church? (p. 24).

This, of course, is nothing more than unsupported assumption.

The remainder of the text, which deals for the most part with the plates, is almost superfluous, since its important points are sufficiently covered by the descriptive lines beneath each illustration. These plates originated in the author's desire to convey practical information by photographic reproductions of lace, and thus avoid the unfolding and actual handling of her valuable specimens. The idea of such reproductions, however, is not so original as Mrs. Pollen thinks, since the same method has already been followed with success by Bertha von Jurie in her unpretentious but useful "Spitzen und ihre Characteristik." And the part which a succession of photographs might play, if accompanied by a really adequate text, is even better shown in the letter from Alan Cole which serves as a preface to the present volume. Through classification of kindred designs, laces have been broadly arranged in three groups: the first designs, involving simple geometric forms, are gradually succeeded by more conventional devices, suggesting plants and animals; while these are followed by attempts at realistic renderings of actual things. These three groups, Mr. Cole asserts, are accompanied by three varieties of equally recognizable textures: "the first comparatively stiff and wiry, the second more lissom and inclined to tapiness, and the third still more lissom, becoming filmy in quality." Without the plates it would be impossible for the inexperienced to visualize this description, but with them a study of the three groups shows exactly what is meant. Of these full-page pictures there are 120, ranging in subject from the alb, said to have been worn by St. Francis of Assisi (1182-1226), to details of mantillas and lappets of the nineteenth century. They are admirably executed, and, with the exception of a few fragile laces like *point de gaze*, whose delicacy it is impossible for any form of graphic art to express, they show with amazing clearness the effect produced by different kinds of stitches. Particularly interesting are the examples of *tela tirata*, or drawn work, which is commonly classed as an earlier form of lace, although it does not comply with the popular understanding that lace is a fabric created independent of any foundation. The portrayal of a number of enlarged varieties of *réseaux*, the mesh background of both needle and bobbin-made laces, is also illuminating.

A glossary of Italian terms, although promising in appearance, adds little to the general glossary published in 1900 by Jackson and Jesurum. The added terms are almost entirely stitches used in *tela tirata*, such as *punto a rammendo*, *punto a stuora*, and *punto treccia*, darning, matting, and tress-stitch, respectively. The book is beautifully printed and handsomely bound. If supplemented by a good history, tracing the development of design and technique, its excellent plates would have genuine educational value, but in the present form its usefulness is practically limited to the collector or to those already somewhat familiar with the history of lace.

Of quite another type is "Chats on Old Lace and Needlework." Its style is colloquial and its text is arranged with an eye to easy assimilation. The numerous illustrations are mediocre, but they are skilfully handled in relation to the subject, their uses being well shown in the chapter, "How to Identify Lace." The sections devoted to sale prices of old laces and embroideries are novel and interesting. Modern lace, also receives brief treatment, but in this connection a tendency to immoderate statement is shown. In speaking of Russian lace, the author says that only two special kinds of hand-made lace are known in that country. Now, Mrs. Mincoff, in her "Pillow Lace," 1907, tells us "Great quantities of lace, mostly of coarse thread in vermiculated patterns, are produced in Central Russia; 32,514 lacemakers are employed." This is only one of several instances of too hasty generalization. The book belongs to the get-wise-quick class, but its size and arrangement make it a convenient handbook for household use, and as such it may be recommended.

The November number of the *Burlington Magazine* is unusually technical and archæological, even for this publication. The section on Art in America deals with nothing more recent than Persian bowls of the ninth century in the Metropolitan Museum, and pictures of the fourteenth century, in the Jarves collection at New Haven, and nothing more modern than a sketch by Constable is reproduced in the body of the number. The leading article is on the art of that inartistic people, the Spartans; and that of next importance is on the origin of certain Oriental carpet patterns. While the connoisseurs for whom the magazine is professedly published will doubtless find their account in it, there is little to appeal to the ordinary lover of beauty.

At least one valuable addition to the information available to English and American readers about Delft potteries may be credited to "Delft Ware, Dutch and English," by N. Hudson Moore (F. A. Stokes Co.). This addition is a statement of the substance of Joost Thooft's pamphlet, "De porselene Fles," which relates the story of the survival of the factory of "The Porcelain Bottle," with a record of continuous productivity (though not of Delft ware at all periods) from 1672 to the present day. The new Delft, it must be admitted, is not altogether convincing—with the practical abandonment of stanniferous enamel on coarse bodies and the adoption of practices that were first introduced by Wedgwood. The product is hardly comparable with the old Delft in simplicity of design or charm of tone. For the rest, Mrs. Moore's book has been judiciously and interestingly compiled from the recognized sources of authority, with inclusion of certain data and illustrations that bear on the importation of Delft ware to this country. The list of Delft potters with their marks is inclusive enough for the purposes of the collectors for whom the manual is designed.

"Arts and Crafts in the Middle Ages: A Description of Mediæval Workmanship, in Several of the Departments of Applied Art, Together with Some Account of Special Artisans in the Early Renaissance," by Julia De Wolf Addison (Boston: L. C. Page & Co.) is a good book; but it will probably, in many instances, prove too advanced "to inform those who have no intention of practising such arts." Its wealth of general ideas, specific descriptions of craft processes, and quotations from original documents, will, one may suspect, best be appropriated by those who have already acquired a little store of

practical information through actually handling and manipulating some of the tools and materials of the various applied arts. Cultivated people, however, of whatever previous training and tastes will at least get entertainment from the author's occasional personal sallies and from the quaint and amusing transcripts from old writers. The chapters would be easier reading if the material in each were arranged under definite propositions. A certain large logic is revealed by perusal, but the first impression is one of confusion. The colored illustrations are admirable. Despite palpable defects of literary craftsmanship the book should be especially valuable to workers in the arts and crafts, as the production of one who is not only an accomplished executant in the departments of ecclesiastical decoration and illumination of books and manuscripts, but who appreciates beyond the generality of craftsmen the importance of basing present-day accomplishments on knowledge of what has gone before. Her inquiry about each of the arts discussed is practical. She seems always to ask what are its capabilities, what its proper limitations. The natural curiosity which the worker feels concerning the social and professional conditions under which superior art was produced is met not by rewritten description, but by citations from original sources.

Considerable new material is utilized by the recent work of Dr. August Heisenberg of the University of Würzburg, "Grabeskirche und Apostelkirche: Zwei Basiliken Konstantins" (Leipzig: Hinrichs). Largely on the basis of a manuscript found in Milan, the author, especially in the departments of philology and of the history of architecture, is able to offer new data on the famous Church of the Holy Sepulchre in Jerusalem and the Apostles' Church in Constantinople. The discussion of the Church of the Holy Sepulchre occupies 234 pages, and is illustrated by 14 tables and 14 drawings; and the Apostles' Church 284 pages, with 10 tables and 3 sketches. The two volumes of the work, however, cover a great deal more than these two subjects, as indicated by the subtitle, "Untersuchungen zur Kunst und Literatur des ausgehenden Altertums." The period treated is from the fourth to the sixth century.

A welcome addition to the handful of good books on Japan is Gaston Migeon's "Au Japon: Promenades aux sanctuaires de l'art" (Paris: Hachette). M. Migeon, a curator of the Louvre, is naturally free from the jocular amazement of the average scribbling tourist. He has the positive distinction of being about the only European author who has written on Japan with full appreciation of the value of its early hieratic art. Unhappily, the Western world has formed its idea of the art of Japan and of the character of the nation as well, from the prints and gimcracks of the last two hundred years. Exquisite in workmanship, this little art belies the great art that preceded it. The knowing person presumably has a nodding acquaintance with Kôrin and the Kano school. But how many professional students of art know of those remoter Chinese and Japanese monks whose religious painting is comparable to the best of the Italian primitives—who had as well discovered the secrets of landscape and atmospheric effect at a time when the ancestors of Claude and Monet were still barbarians? To this older painting and to the sculpture of Nara, which he does not hesitate to rank with the best products of Egypt and Gothic France, M. Migeon devotes most of his pages. But he is also appreciative of the popular school, which native purists usually underestimate. The chapter on the temples of Nara will be decidedly useful to the deliberate traveller. Very charming are the descriptions of the three famous landscape regions of Japan, of the Nô dance and popular theatre. But one could wish that M. Migeon had passed some of these rather familiar themes in behalf of the private collections which he mentions tantalizingly. Here some consideration of discretion may have sealed his lips. To Americans this excellent work on the ancient art of Japan brings a keen regret. It was an American, the late Prof. E. F. Fenollosa, who better possibly than any other Occidental knew this great period. It was he who virtually made the magnificent collection at Boston, and aided in assembling the even choicer Freer collection, which is already dedicated to the nation. Yet fate willed it that Fenollosa should write only on the recent popular school, never reaping as a connoisseur the fruit of his labors as a collector. Who will undertake the great task, the most rewarding life work that remains in the history of art, of giving us a scientific history of ancient Chinese art, and of its greatest offshoot in old Japan?

Many contradictory reports have been circulated with regard to the intentions of the Italian government on the question of excavating Herculaneum. The correspondent of the London *Times* has made an interesting and reassuring report. The Italian government, we are told, is willing to carry out the excavations, and has set aside £2,400 for the preliminary research advised by archæological authorities. The new law, however, introduced by Signor Rava for determining the compensation to landowners, though it has passed the Chamber of Deputies, has not yet passed the Senate. Under this law all antiquities found in excavations belong absolutely to the State, and landowners have no property or interest in them whatever. Under the former and still existing law landowners are entitled to a considerable share in the value of antiquities found. Unfortunately, the most extravagant hopes have been raised among the owners of houses at Resina, who refuse now either to sell their land or to permit excavations, except under preposterous conditions. Until the new law is passed, therefore, nothing can be done, unless, as Professor de Petra suggests, a special law is made for Herculaneum, as has been done in the case of the Zona Monumentale in Rome.

The tenth annual exhibition of the American Society of Miniature Painters will be opened at Knoedler's Galleries, in this city, on January 23, and continue until February 6.

An exhibition of arts and crafts at the National Arts Club, in this city, will be open till December 28. Among the exhibitions at the dealers' galleries are water colors by Mrs. W. J. Stillman, at Oehme's; decorative panels by Gustave Cimiotti, jr., Bauer-Folsom's, till December 12; paintings by members of the Painters' Club, Julius C. Haas's, December 12; paintings by Frederic Remington at Knoedler's, December 12; three centuries of engravings and etchings, Ederheimer's, December 31; mezzotints in color from paintings by old masters, Klackner's, December 31; etchings, dry-points and mezzotints, Sir Seymour Haden, Frederick Keppel & Co.'s, January 2.

William Martin Aiken, the architect, died in this city December 7 at the age of fifty-three. He was born in Charleston, S. C., attended the University of the South, taught school for a time, and then studied architecture at the Massachusetts Institute of Technology. From 1880 to 1883 he was in the office of the late H. H. Richardson, Boston. He practised architecture in Cincinnati, 1886-1895; taught in the Cincinnati Art Academy; was supervising architect of the United States Treasury Department, 1895-1897; he designed the government exposition buildings at Atlanta (1895), Nashville (1897), and Omaha (1898), the mint buildings at Philadelphia and Denver, and numerous post office and custom-house buildings. Since 1897 he had been in practice in New York; from 1901 to 1903 he was consulting architect for the Borough of Manhattan. He contributed to Russell Sturgis's "Dictionary of Architecture" and he had written for the *Nation*.

Finance.

GOLD OUTPUT AND PRICES.

The extraordinary rise in prices of commodities, between the middle of 1897 and the middle of 1907, the "industrial boom" which accompanied that advance, and the extravagant era of speculation which resulted, have of late converged unusual attention on the theory that gold itself was depreciating because of greatly increased production. As to the fact of that increased production, there is no dispute. From $237,833,984 extracted from the world's mines in 1897, the output rose to $412,556,136 in 1907. During the same interval, the "index number," giving an average of prices for selected commodities, also rose, according to Sauerbeck's system of computation, from 62 to 80, and, according to the London *Economist's*, from 1,885 to 2,601. Even as a coincidence, the exhibit of gold output and of price movements is striking, and the average mind is too prone to the *post hoc* argument to neglect the inviting inference. Hence the assumption that the rise in prices occurred because of the increased gold production—an assumption which, applied in popular reasoning to property of all sorts, to wages, and to the price of securities, as well as to commodities—became specially interesting during the crash of 1907. How could such a fall in prices have occurred in the absence of decreased gold production? The world's gold output had not decreased; it was $7,495,000 greater in 1907 than in 1906, and has probably been larger still this year—in spite of

which the *Economist* "index number" declined from 2,601 in June, 1907, to 2,168 in September, 1908.

A valuable contribution to the discussion was published recently by the *Engineering and Mining Journal* of this city, from the hand of its editor, Walter Renton Ingalls. Mr. Ingalls flatly takes issue with the whole theory of increased gold production as a cause of the enhancement of prices in the last decade, and he disputes it on the basis of statistics. Increase of gold production, he admits, will cause increase in price of commodities, other things being equal. But other things are not equal:

> Population and the production of the necessaries of life may increase in the same ratio as the production of gold, so tbat the latter merely supplies the increased requirement for it, and under that condition will not influence prices one way or the other. Industrial changes in processes of manufacture, means of transportation, and many other conditions may affect prices so that the average of the latter will go down, while the production of gold goes up, or *vice versa*. The crises of 1873 and 1890 were each followed by several years of severe commercial depression, but in each case, while prices were falling the production of gold was increasing.

He finds the fairly exact coincidence of the movement of gold output and commodity prices, in the decade before the panic of 1907, to be exceptional, in that other periods show sharply contrasting movements:

> After the crisis in 1857, the prices for commodities rose steadily until 1864, while the production of gold was going down. Prices then declined until 1870, while gold production was fluctuating between comparatively narrow limits. In 1871 prices started upward and rose until 1873, while gold production was declining. Prices then fell steadily until 1879, while gold production was increasing. After a slight rise of prices in 1880, the decline was resumed, and this time coincided with a declining gold production until 1883, when gold production began the rise which has continued with only slight interruptions ever since, while the decline in commodity prices kept on until 1896. Thus it may be seen that from 1858 to 1896 the prices for commodities frequently went down as the production of gold increased, and *vice versa*.

To what, then, are we to ascribe the steady enhancement of prices since 1897, proceeding step by step along with enlargement of the gold output? Admitting the improvement of industrial methods in the period—which should have tended not to raise, but to lower, prices—Mr. Ingalls assigns as the true causes of the advance in cost of necessaries of life "the exhaustion of certain natural resources, such as timber, tending to increase prices; the policy of labor-unionism and the increasing inefficiency of labor; the industrial consolidations, accumulation of great fortunes through anticipation of profits, and an inauguration of general extravagance in living; waste of resources and reckless expenditure of money in replacing them; over-extension in enterprise; failure of agricultural development to keep pace with the growth of population, thereby increasing the cost of food and clothing and directly leading to advance of wages for labor in manufacturing." Premising that "any possible depreciation in the value of gold must arise from an increase in the ease of obtaining it," Mr. Ingalls proceeds to point out that the cost of gold production is increasing, not decreasing; that even in the Transvaal, the grade of the ore extracted has rather steadily diminished; that the seemingly enormous dividends of the companies operating in the Rand are in reality part repayment of capital with a view to eventual exhaustion of the mines; that the rich "placer mines" of a generation ago are rarely discovered nowadays; and that gold mining "is now carried on as an industry, and, as in the case of most industries, at a small margin of profit on the whole."

The article does not discuss the immediate bearing, on the problem of price enhancement, of the mere accumulation of gold in bank reserves. Our own feeling is that increased gold production nowadays exerts its influence on financial and commercial markets through that medium, with the consequent lavish extension of credit, more than through any other. So long as things go well, the effect of the easy credit, thus created, on the speculative markets, on the capitalization and borrowing power of the industrial consolidations, on over-extension of enterprise, and on general extravagance of living, may go far towards explaining both the "boom period" of the past ten years and the violent reaction which has followed.

LIPPINCOTT'S STANDARD REFERENCE WORKS

Lippincott's New Gazetteer

Edited by ANGELO and LOUIS HEILPRIN

A geographical dictionary of the world, giving an accurate picture of every corner of the globe in its minutest details as it exists in the twentieth century.

"A work of such thorough execution and admirable plan as to leave no room for adverse criticism."—*The Dial.*

Over 2000 pages. Quarto. Sheep, $10.00 net; half Russia, $12.50 net; patent index, 50 cents extra.

Chambers's Cyclopaedia of English Literature

A clear and comprehensive survey of English literature from its beginning to the twentieth century.

It contains an authentic biography of every American and English writer of note, an account of his work, many extracts, and 300 approved portraits and facsimiles. It is the cheapest authoritative reference work of similar scope now in print.

New edition. Three volumes. 2500 pages. Imperial octavo. Cloth, $12.00 net per set.

The Reader's Reference Library

The most complete collection of useful literary handbooks in the English language.

14 volumes. Crown 8vo. Half morocco. For terms inquire of your bookseller or the publishers.

Chambers's Encyclopaedia

New Edition Complete in Ten Volumes

A library of universal knowledge, containing a complete history of all races, nations, and times, of religions, politics, languages, arts, sciences, etc.

The most useful encyclopædia in the language. Famed for its reliability, compactness, and completeness.

Sold by subscription only. Three dollars secures the use of the entire set at once, and the balance can be paid in little-at-a-time amounts.

LIPPINCOTT'S UNIVERSAL

Pronouncing Dictionary of Biography and Mythology

This magnificent work has lately undergone an extensive revision. It is now offered to the public in a greatly improved form, embracing, besides the revision of the articles included in previous issues, numerous new biographical sketches of persons who have lately become prominent.

One volume. Sheep, $8.00; half morocco, $10.00. Also a subscription edition in two large octavo volumes. 2550 double-column pages.

Benham's Book of Quotations

This is the latest, and by far the most complete, work of its kind. It contains over 32,000 references, selected from 1,300 authors, and full verbal index.

8vo. 1256 pages. Cloth, $3.00; half calf, $5.00; half morocco, $5.50.

Allibone's Dictionary of Authors

With Supplement by JOHN FOSTER KIRK, LL.D.

A critical dictionary of English literature, containing records of the writings of over 83,000 British and American authors. It is the only work of its kind, and contains a perfect mine of information about books and their authors.

Five volumes. Imperial octavo. Per set, cloth, $17.50; half morocco, $37.50.

Sample pages and full particulars of these works sent on application.

New York Cincinnati Chicago

The Nation.

NEW YORK, THURSDAY, DECEMBER 17, 1908.

The Week.

In appointing a committee to inquire into the President's statements regarding the use of the secret service men, the House has gone too far to retreat. There are intimations in Washington that an effort will be made to "hush up" the quarrel between the Executive and Congress. That is now impossible without reflecting seriously upon one or the other. If Congress fails to press the matter, everybody will say that it is filled with scoundrels whom the President frightened by threatening to expose. In the process of collecting materials of war, the President will doubtless go to the *Congressional Record* of May 1, 1908. Therein is the record of the debate in the House on the paragraph in the Sundry Civil Appropriation Bill to which the President referred in his message. He said many unpleasant things about the intent and effect of the clause providing that the secret-service agents of the Treasury should be used "for no other purpose whatever" than the one expressed in the law. The President declared that this has "seriously hampered the government in the detection of crime." But the danger that this might happen was brought forward in the debate in the House, and was then and there disposed of. It was shown that the power of any Department to employ detectives was not in the least curtailed, and that, in particular, the Department of Justice had a specific and ample appropriation for that purpose. If the Attorney-General has been "hampered" in the running down of criminals, it has not been for lack of funds put at his disposal by Congress.

The saying of the President which has most rankled in the bosoms of Congressmen, and which seems to have been most unjustifiable, was that "the chief argument in favor of the provision was that the Congressmen did not themselves wish to be investigated by secret service men." Now, by this Mr. Roosevelt must have meant the argument by which Congressmen in their heart of hearts were most influenced; he was apparently thinking of a secret argument, or, at the most, what the logicians call an enthymeme—an argument only half expressed, the rest being kept in the mind. But it is exceedingly difficult to prove what another man is thinking of. Turning to the actual record of the debate on the bill in the House, we do, indeed, find one reference to the use of secret service agents to "shadow" Congressmen. The fact was first brought out that the Secretary of the Navy had employed detectives to find evidence that a certain naval officer had been guilty of conduct unbecoming a gentleman and an officer. Then occurred the following colloquy:

> Mr. Sherley—The gentleman may be aware of the fact that this Secret Service at one time was used for the purpose of looking into the personal conduct of a member of Congress, notwithstanding the gentleman seems to think that they are answerable to no one.
>
> Mr. Bennet of New York—The gentleman is not aware of anything of that kind. As far as the gentleman has investigated it has been denied.
>
> Mr. Sherley—But that was the fact.
>
> Mr. Bennet of New York—The allegation was made, if the gentleman will permit, that the particular investigation was made not by a member of the Secret Service, but by a police officer of the city of Washington, who, when it was ascertained that he had done that, was summarily dismissed from the police force.

This would make it appear that the President's "chief argument" was advanced only to be repudiated and its basis of fact denied.

Far from clearing up the mystery of the Brownsville shooting, the President's message on that subject has made the confusion worse confounded. He has sent to Congress a report which he himself admits to be "incomplete," and to contain matter that is "worthless." It would have been better to wait until the investigation, which he says is to be pushed further, had been finished, and the results sifted and weighed. As it was, Senator Foraker was at once able to read letters throwing doubt upon the "confession" of one of the negro soldiers which the President had triumphantly produced. No one who has read with care all the evidence brought out before the Senate committee, can doubt that *some* of the negro soldiers may have got out of hand and taken part in the Brownsville shooting; but there never was positive proof in the case of a single individual. Whether the evidence now brought forward by the President is valid, is a fit subject for inquiry. It certainly was obtained under suspicious circumstances; corroboration is as yet lacking; and the particular soldier involved denies that he ever made the statements reported by the illiterate negro detective. We note with satisfaction, however, that Mr. Roosevelt is inclined to take a more reasonable view of the possible reinstatement of the negro soldiers, summarily discharged, innocent and guilty alike. He now favors a law putting back in the army any of the men who can show that they had nothing to do with the shooting, or any "guilty knowledge of it beforehand." It must be said that Mr. Roosevelt's reasoning in the whole matter is difficult to follow; he speaks of the facts as before "established beyond all possibility of doubt," and as now, by the new evidence, fixed with "tolerable definiteness." At one point, he betrays himself into the admission that "innocent" soldiers were discharged, but immediately adds that there were "hardly any innocent," but a few who were "less guilty"; yet only those who can prove themselves "innocent" may hope for reinstatement! Through all this, however, there runs a dawning sense that a great injustice has been committed, and that the President wishes it might be righted.

Mr. Roosevelt's message would not be characteristic of its author without much talk about army and navy. Not content with that, however, he has sent in an emergency message for the passage of a law regulating in advance the war-time organization of regulars, national guard, and volunteers. The plan, he says, will not cost us a dollar in peace-time, and will insure the creation automatically of war-time forces, organized with a view to profiting by past experiences and mistakes. Congress will probably find little chance for the discussion of this measure, or for the numerous other recommendations regarding the army and navy; indeed, to most of these Congress has hitherto wisely turned a deaf ear. There was that emergency message sent in by Mr. Roosevelt

two years ago, in which he declared it of transcendent importance that he should be forthwith given power to dismiss navy officers without trial by court-martial if, in his opinion, they had misconducted themselves. But Congress calmly disregarded the message—and now that very pressing matter is apparently forgotten. Probably the only recommendation for the navy that will be seriously debated is that for four more battleships.

A report from the Secretary of War without recommendations for more men and more officers would be an anomaly. Secretary Wright, therefore, follows his predecessors in asking for 612 more officers to take the places of those on detached duty, and an increase in the Coast Artillery of 1,070 officers and 26,392 men. Mr. Roosevelt goes even farther. In the cavalry he wants an immediate reorganization and increase of presumably five or ten more regiments. Whatever may be the merits of that proposal, there is very little, if any, in the request for more officers, because of absenteeism. The more Congress yields in this matter, the greater will be absenteeism and the less effort by the War Department to check the evil. More satisfactory is the report that desertion is on the wane again, and that the skeleton companies of a year and a half ago are being recruited. Instead of being 19,673 short, as on October 15 last year, the number is only 9,422. Plainly, industrial depression has helped the army by driving to it the unemployed and stimulating reënlistments, while the increases in pay granted last year and the greater severity in the punishment of deserters have also contributed to the result. Altogether, no less than 152,141 men applied for enlistment, of whom 109,721, or 72 per cent., were rejected, because they were illiterate or were not citizens or were suffering from mental, moral, or physical defects. No less than 41,463 applicants were accepted, of whom 11,793 were men desirous of reënlisting—an unusually large number.

Mr. Taft does not crack the loud whip or fire dreadful preliminary broadsides at hypothetical opponents; but his quiet manner of "getting together" with people whose opinions are different, is none the less effective. The conference last week between the President-elect and the Republican members of the Ways and Means Committee brings new assurance that in the lower house, at least, there shall be no comfort for the hardened "standpatter." "I have every reason to believe," said Mr. Taft, "that they [Mr. Cannon and the Republican floor leaders] are keenly alive to the obligation which is on them as Representatives elected to represent the Republican party, to prepare an honest and thorough revision of the present tariff." There are no hints of what will happen to Congressmen who persist in their sinister subserviency to criminal interests; but a manly declaration of purpose and firm intent to see to it that whatever can be done to impress upon Congress the necessity of giving ear to the insistent desire of the country, shall be done.

Both Mr. Taft and the President have recently suggested that a large bond issue might be the best way to bring about the comprehensive improvement of our waterways. Gov. Johnston of Minnesota seems to be of the same mind, as he has spoken of the $300,000,000, which the Lakes-to-Gulf canalization would cost, as a "mere bagatelle." Every one must see that these vast projects, if seriously taken up, cannot be paid for out of current revenues. One of the inevitable consequences of putting out a large amount of new United States bonds would, however, be the embarrassment of currency reform, since such an issue would enable advocates of bond-secured circulation to argue that the supply of government securities will never run out. Thus it might be more difficult to persuade the people to abandon a rigid and unscientific system of currency. All this, of course, is no argument against bonds for internal improvements, if they are deemed necessary; but currency reformers must prepare themselves to overcome this new obstacle.

What Congressman does not deplore the evils of patronage and piously wish that he might be delivered from all office-seekers? And yet, when asked to vote for civil service reform, he recites the tenuous old sophistries which Representative Hepburn of Iowa dressed up last week for the debate on census-bureau employees. Competitive examinations, Mr. Hepburn said, are not so effective as the spoils system; the government knows only about "scholastic attainments," "while under the old method the applicant's integrity and industry were vouched for by a member of Congress." If all Congressmen had expert knowledge about integrity, if they were not in the habit of measuring a voter's industry by his zeal in repairing his patron's political fences, the country would more readily entrust the choosing of sixty thousand census enumerators to Mr. Hepburn and his colleagues. As things stand, however, the defeat of the civil service amendment to the census bill by a vote of almost two to one means a victory for wire-pullers and small jobbers. The triumph, we hope, will be short-lived. The Senate and the President still have their say.

A farmer might say that the National Conservation Commission has not helped its cause by showing one-quarter of the whole country to be still timbered. One acre of trees to three of clearing does not seem to be a dangerous ratio. Senator Smoot's report, however, might have made clear that one of the most serious features is the unequal distribution of our forests. Waste there is, terrible fires there are, and also far too little planting; but if the trees still surviving were ideally situated, worry might be deferred for many years. What we find, however, is a few great clusters in mountains and in remote districts, and everywhere else barren stretches, or at best occasional tiny patches of woodland. The evils traceable to this arrangement are perhaps the strongest arguments in favor of immediate, thorough forest regulation by States and the Federal government. Lumbermen may repent and learn to care properly for their own acreage; but, as individuals, they cannot make trees grow where the rivers and the soil most need them.

The popular vote for President, as compiled in the New York *Times* of Sunday, is interesting mainly in its figures for the smaller parties. Whether the Republican vote or the Democratic showed a higher rate of increase since 1904 or 1896, matters little, in face of the fact that, with Bryan in the field, so many Democrats abandoned party lines. But the disappointment of the Socialists, the Prohibitionists, and

the Independence Party are more interesting. The drift this year was away from the smaller parties. The Debs vote will be within two or three thousands of what it was four years ago, an increase of one-half of one per cent., instead of the 150 per cent. fondly predicted. The Prohibitionists suffered a loss of about 10 per cent., and the Independence Party polled throughout the entire country only some 82,000 votes. The Socialists profess to have found this grain of consolation: The Debs vote of 1904 was much swollen by radical Democrats who plumped for the Socialist ticket rather than vote for Parker; in Chicago the teamsters' strike had a decided effect on the Debs poll. In other words, there were in 1904 tens of thousands who voted for the Socialist ticket on temporary issues, and not because they were properly class-conscious. Hence, to have suffered no loss in the last election, that is, to have seized those thousands of weak brethren and turned them into true Socialists who would not desert even under the threat of increasing panic, was in itself a triumph. The argument has, however, its weak points. If the Socialist standstill this year meant that conquered ground had been held, though no new acquisitions were made, the explanation would suffice. But as a matter of fact, the Socialists this year managed to hold their own because their gains in new territory balanced their losses elsewhere. A loss of 35,000 Debs votes in Illinois shows that the Socialists have *not* turned the neophytes of 1904 into true believers. To make only the slightest gains in New York, Missouri, and New Jersey, to lose in Illinois, Iowa, Kansas, Massachusetts, Ohio, and Wisconsin, and to make large gains in such fresh soil as Colorado, Florida, Idaho, and Oklahoma is proof that the Socialists are still subject to the fluctuations that mark the fortunes of other political parties.

On the eve of another sensational murder trial, a movement has been started in this city to induce the newspapers to omit "libidinous details of criminality." The appeal is made to the press on the ground of public decency, and with the aim of securing newspapers that may be taken into homes without dread of their containing "lewd or suggestive articles." It is good to know that serious-minded and influential men are giving thought to this matter. It is a plain question of public morals. We do not see, however, why discussion of it, and agitation about it, should be limited to times when revolting crimes are committed, or when the ends of justice require that disgusting testimony should be brought out in court. The need of fighting for decency in the press is as continuous as is the temptation to vulgarity, sensationalism, and pruriency. One thing in the letter on the subject, signed by well-known citizens, is of special weight. It is the intimation that "readers and advertisers" could secure a clean press if they truly wished it, and set about obtaining it with real determination. This is gospel truth. The most offensive and reckless of our newspapers could be compelled by their advertising patrons to reform or die. This is elementary to the whole debate.

France has just awakened to the fact that for a nation aspiring to the leadership in culture, she has a disagreeably large number of citizens who can neither read nor write. Among last year's recruits, there were no less than 10,000 illiterates; the same number has turned up this year. In addition, there are 5,000 young soldiers, who can read, but not write. Taking the annual military contingent at about 300,000 men, roughly, this would give France 5 per cent. as the ratio of illiteracy for her adult male population. For the nation at large, the ratio would, of course, be higher still, illiteracy being more widespread among women. In the German army, in 1904, the percentage of illiteracy was 1-25th of one per cent. The highest ratio, 3-20ths of one per cent., stood for agricultural and slow-moving East Prussia. Most of the smaller German states had clean scores. The French showing is received by the opponents of the government with a certain amount of malicious satisfaction, because the anti-clericals have been accustomed to boast of what they have done to disseminate secular education among the people. The French newspaper humorists suggest that many conscripts have pretended ignorance just to tease the government; but the Minister of Education has considered the situation serious enough to issue a circular calling upon his subordinates for an active campaign in town and country.

SECRETARY CORTELYOU'S WARNING.

The manner in which public expenditures have swollen in recent years, under the burden of competitive armaments, seems at last to have excited alarm among those charged with responsibility for the new burdens. The increase of the expenses of the German Empire, which is leading to the search for new forms of taxation, and the constantly heavier burden of public debt in France, which is causing rumors of another large loan, are fortunately not paralleled fully in this country because of the rapidity of our growth and the elasticity of our sources of revenue. It is a startling fact, however, which is set forth by Secretary Cortelyou in his annual report:

> If interest on the public debt is excluded, the growth in ordinary expenditures for carrying on the government, including payments for pensions and many public works, was from $135,000,000 in 1878 to $638,000,000 in 1908, or an increase in a generation of nearly 400 per cent.

This increase has happily not been attended in this country, as to a large extent in Great Britain and on the Continent, by increase in the permanent debt. The difference is explained partly by the fact that the population has increased in thirty years nearly 85 per cent., and the national wealth, according to the somewhat uncertain figures of the census, by about 185 per cent. Even with these qualifications, however, it is obvious that Federal expenditure has been growing at a rate which calls for serious consideration and for a careful sifting of the objects and methods. It is such a sifting which Mr. Cortelyou urges upon Congress. As he points out, there is at present no single authority responsible for coördinating the appropriations for each branch of the public service and adjusting outgo to income. Congress plunges blindly ahead, making such appropriations as seem good to various committees, without any sense of proportion between respective demands. Even the Speaker of the House and the Committee on Appropriations have no responsibility, beyond that of fellow-members, for reviewing the work of other committees charged with such important appropriation bills as those for the army, the navy, the Department of Agriculture, and the diplomatic service.

Even worse than this lack of coördina

tion is the log-rolling for local appropriations. It becomes a contest in which the member with the strongest "pull" or the greatest capacity for hustling is the winner. While there is much less direct corruption in the Federal service than in that of many of our cities, no one has any official obligation to point out that a sum of a million dollars, for instance, might be better expended for proper residences for our representatives in foreign countries than for ugly and unnecessary Federal buildings at county seats. Even if such a function is assumed by a broad-minded and far-sighted Secretary of State, his recommendation weighs little against the activity of a pool of individual members of Congress which will enable each to go home and tell what he has done for his "deestrict." Bad as the system is, it is matter for surprise, perhaps—and in some measure a tribute to the average of American honesty—that the results have not been infinitely worse than they have been.

The essential difficulty in securing coordination and proportion in expenditures is the absence under our government of a responsible ministry, or concentrated control of the budget. It is difficult to see how such a control can be established directly and completely by law. Much might be done, however, by a resolute attitude on the part of the Treasury Department. The Secretary of the Treasury, as Mr. Cortelyou points out, occupies a peculiar relation to Congress, and ought to be responsible, in a measure, for the total amount of the estimates and the sums actually appropriated and expended. He ought to be supported by the President in cutting down the estimates to the income of the government, unless extraordinary circumstances should demand a temporary or permanent increase of the debt. Secretary Cortelyou has taken up this subject none too early, and it is gratifying to learn that he proposes to make an analysis of income and expenditure, which will yield a clearer view of their relations to each other, and of their objects, than is afforded by the present clumsy form of Treasury statement.

Something might be accomplished, both in balancing the budget and in enforcing sense of responsibility upon Congress, if it were provided by law that whenever appropriations or expenditures exceed the reasonable estimates of revenue, short-term obligations should be issued to bridge the deficit. If the budget were then so managed that the deficiency of lean years, like the one which has followed the panic of last fall, should be met from the surplus of fat years, a somewhat higher sense of obligation for keeping expenditure within the limits of income might be imposed upon Congress and the Administration. While the problem of fastening such an obligation definitely upon an official or a committee of Congress is difficult under our government of divided powers, it is well that attention has been sharply called to the subject by the official who comes the nearest to possessing authority and responsibility.

PUBLIC MEN AND SECRECY.

In Judge C. C. Nott's recent book, "The Mystery of the Pinckney Draught," one of the incidentally suggestive things is the bringing out of the extraordinary secrecy in which the proceedings of the Constitutional Convention were shrouded. Not only at the time, but for years after, the delegates remained close-mouthed. They were bound by no oath; it was simply the honor of gentlemen that forbade them to divulge secrets which, in fact, they carried to the grave with them. At the close of the Convention, it was determined that the obligation of secrecy which had been assumed while it was at work, should be continued indefinitely. The records were sealed and placed in the custody of Washington. "For thirty years and more the seals remained unbroken; and for thirty years and more no member of the Convention spoke." Washington's diary had an entry, under date of June 1, 1787, which shows what a standard was then set when men undertook not to reveal anything: "Attending in Convention—and nothing being suffered to transpire, no minute of the proceedings has been, or will be, inserted in this diary." The sense of honor in cleaving to a pledged word was exhibited most surprisingly by the members of the Committee on Detail—who had so much to do with fixing the form of the Constitution:

> The work was done in secret; they employed no secretary. . . . After the committee was discharged, no hint or word seems to have escaped them. No man boasted of his own part, or disparaged another's. No son or daughter or grandchild has revealed a word that any member subsequently said.

There were and are, for example, disputes about the part that Wilson played in draughting the Constitution. After his death, three of his fellow-members of the Committee on Detail survived. But "Rutledge lived two years and Ellsworth nine years and Randolph fifteen years, and gave no sign."

It may be partly in imitation of this high example that the South African Convention has been sitting in absolute secrecy. The men who gathered at Durban in November had before them a task not unlike that of the men who gathered in Philadelphia in 1787. It is a work of federation and, prior to that, conciliation. They have surrounded their labors with what the London *Times* calls "a wise obscurity." No representatives of the press are permitted to be present. No fragmentary reports are given out. The delegates prefer that their results shall be judged as a whole, and that the successive steps of compromise and adjustment shall not be known. After the South African Convention adjourns, however, it may well be doubted if such a remarkable secrecy can be maintained as was observed by the members of the American Constitutional Convention.

Since their day, a great change has come. It is a change partly in men's minds, partly in their circumstances. Public men nowadays are less inclined to keep secrets; and the aids offered them, when they feel the impulse to blab, are infinitely multiplied beyond what they were in Washington's day. In the habit of present-day thought, the instinct for publicity has supplanted in statesmen the instinct for secrecy. Their first thought is, not how can I keep this from becoming known, but how can I make it known so as best to work out to my advantage, or that of my party? And whenever they feel overburdened with retained secrets, the modern reporter is at their elbow to relieve them. Newspapers have murdered secrecy. For a public man to take to-day the motto of the poet, "Oh, let me live my life unto myself alone," is becoming more and more impossible. Publicity always sits behind him like black care. Hence it is really a great achievement when a statesman can do what Lord Northcote, the Governor-General of the Commonwealth of Australia, has just done. He sailed for Europe Saturday, after travelling from Vancouver to Montreal,

and thence to New York and Washington. During these weeks, he made what an admirer has called a "non-publicity record." He evaded interviewers, escaped banquets, refused to parade either his person or his sentiments. It would seem that he must have had more satisfaction, as well as distinction, in following such a course than in running the usual round of indiscriminate publicity.

For seven years past, our political life has been one long riot of publicity. Following the fashion set by one of the shrewdest advertisers that ever lived, our public men have lost the inclination to reticence, if they ever had it. Every seal is made to be broken, every trust to be betrayed. The thing is not merely to wear your heart on your sleeve, but to cut open that organ, and lecture on its anatomy. We must have no secrets from the dear public. The grave continence of the Constitution-builders is hopelessly out of style. We have not even Hotspur's safeguard that "thou wilt not utter what thou dost not know." In the universal giving away of political secrets, many things are confided to the reporters which are neither secrets nor facts. Statesmen denounce a curious and prying press, but they are eager to make to themselves friends of that Mammon of unrighteousness, and they conceive that there is no better way of doing it than by discreet leaking of official secrets. The net result is such a general rush to tattle that the power of keeping one's own counsel now seems among the lost arts.

THE DUTCH AND VENEZUELA.

The capture by the Dutch of the Venezuelan guardships Alexis and 23 de Mayo does not make the "hostilities" appear less like opera-bouffe. The Dutch themselves explain that their act does not mean war; that these harmless vessels, with their rusty rifles, have merely been borrowed for a short time as a reprisal in order to compel Venezuela to pay attention to just demands. It is hinted that in a day or two we shall hear that the two or three other yacht-like Venezuelan gunboats which bask peacefully in the sunshine of La Guayra, have also been taken to Curaçao. But there the leisurely Dutch captains may encounter some opposition, for at La Guayra there is supposed to be a formidable, modern Krupp battery, with plenty of ammunition, perched so high above the water as to make it rather a difficult place for naval shells to reach. But granted that these toy-ships are captured, wherein will the Dutch have gained an advantage? A country that is at this moment at odds with France and the United States as well as Holland, and has angered England to the breaking point, is hardly likely to be influenced by the loss of a navy of no particular fighting strength.

The Dutch may, of course, take the aggressive to the extent of reducing to ashes the towns of La Guayra and Puerto Cabello, the two great northern seaports of Venezuela. Such an attack would doubtless inflict heavy loss on Venezuela, but still heavier on the foreign merchants of Caracas. Last spring, when President Roosevelt vainly asked that Congress give him a free hand in dealing with Castro, the American merchants trading in Venezuelan products were quick to send delegations to Washington to show that if there were any coercing they might be as badly punished as Castro, if not worse. More than that, ever since the joint bombardment of Puerto Cabello by Germany, Italy, and England in 1902, the customs receipts at these two ports have been devoted, according to the decree of the Hague arbitrators, to the payment of the interest charges and debt of the foreign bondholders. This has been done with sufficient regularity up to the present time; for President Castro explains the recent withholding of French payments by saying that, owing to the absence of a French diplomatic representative, the money has been deposited in the State Bank of Venezuela. Hence, if Holland should institute a rigid blockade of Venezuelan ports, or seize Venezuelan custom-houses, there would be loud outcries from the debtholders abroad, as well as from the American merchants who buy Venezuelan coffee and cocoa.

Beyond doubt, it is knowledge of this fact that makes Castro so offensively independent in his attitude towards foreign Powers. Moreover, he is well aware that if worse came to worst, and he were even compelled to retreat from Caracas, which is practically inaccessible from the Puerto Cabello side, he could still conduct a government in the interior and make sufficient money out of it, while his countrymen were carrying on the desperate guerrilla warfare of which they are capable, and in which their strongest ally would be the chill winds and fogs of the Caracas Valley, a far more unhealthy place than the sea-coast towns. Then, too, he would have an admirable excuse for stopping all payments to foreign debtors.

Holland alone could not, of course, undertake a serious invasion of Venezuela. The help of other countries would be essential. For one thing, her own claim for injuries is too slight. Moreover, Castro's marvellous talent in having some right on his side whenever he gets into a dispute with a foreign country did not fail him when it came to Holland. The Dutch cannot deny that M. de Reus, their Minister, was guilty of a grave diplomatic offence; their only contention is that Castro violated diplomatic procedure in sending M. de Reus his passports and expelling him instead of informing the Netherlands government that the minister was no longer *persona grata*, and asking that he be recalled. The Dutch try to explain the attacks upon the Venezuelan consul at Curaçao by asserting that the victim of the riots had never been formally accepted as a consul, and being without his exequatur, was not yet a consul *de facto*—rather a labored explanation. The real offence of Castro in Dutch eyes is his decree of May 11 last, which resulted in the practical suppression of the trade of Curaçao by making obligatory the trans-shipment of all goods from and to Maracaibo and other ports in western Venezuela, at Puerto Cabello instead of Willemstad or Curaçao, as had previously been the custom. To the Dutch demand that this decree be abrogated, Venezuela replies that it alone, as a free nation, has the right to say what commercial laws it shall and shall not make.

So far as the United States is concerned, under the policy laid down by President Roosevelt and Secretary Hay in 1902, in reply to Germany's diplomatic inquiry, there is nothing to prevent Holland's going ahead as energetically as she pleases, so long as she does not seek to colonize or to hold any portion of Venezuela permanently. At that time it was wisely held by Mr. Hay that the South American republics could not avoid punishment for wrong-doing by hiding behind the Monroe Doctrine. On similar grounds, no objection was

made to the temporary British occupation of the custom-house at Corinto, Nicaragua. Therefore, Holland may run on this fool's errand as long as she pleases—without, we hope, any assistance from France or the United States. Neither of these countries has, unfortunately, a clean record in its dealings with Venezuela, for citizens of both countries, who now appear as claimants for damages, have conspired to overthrow Castro's government.

BIBLIOPHILES AND BIBLIOPHILES.

The publication in the London *Times* and the New York *Times* of an account of the library of J. Pierpont Morgan has naturally excited wide interest, partly because the library itself is extraordinary, more because Mr. Morgan is commonly regarded as a financier rather than a bibliophile. To the world which sees the man chiefly as a power in Wall Street, it is surprising to find a side of him devoted to the pursuit of manuscripts, tall copies, and first editions in immaculate condition. And yet it is probable that Mr. Morgan's reputation fifty years from now will rest almost wholly on his career as a patron of art and a bibliophile. His reorganization of railways and the formation of the United States Steel Corporation, the heavy labor of his strenuous days, will be clean forgotten; while the fruit of his recreations, of his hours for play, will keep his memory green, at least in the world of art and letters. His name will be entered on that shining roll of connoisseurs and collectors concerning whom each generation shows fresh curiosity. When the John Hill Burton of the late twentieth century writes a new "Book Hunter," he will devote a long chapter to the exploits of Mr. Morgan; and the Langs and the Dobsons of that new day will enshrine him in their verse along with Heber and De Thou.

And the world will be right in ranking the collector above the financier; for the financiers are many and the bibliophiles few. In his "Books and Bookmen," Andrew Lang speaks of "the famous collectors who make a kind of *catena* (a golden chain of bibliophiles) through the centuries since printing was invented." To secure a place in this distinguished line—it might almost be called royal—is a greater achievement than to found a billion-dollar corporation. The equipment of the successful financier is chiefly energy and a clear hard head, but your successful collector must have something which cannot be bought by telegraphic order—taste and literary judgment. Mr. Morgan, of course—and we take his name as a type—must consult experts; he cannot be expected to know all about illuminated missals in all tongues and to remember all the various title-pages of the first edition of "Paradise Lost"; but he must know where the facts are to be had. And without some controlling and guiding mind, itself informed and cultivated, even the largest heap of gold will buy nothing but a heap of expensive volumes—not a really fine library. Then, too, with your accomplished collector education goes hand-in-hand with acquisition, and to have gathered a notable lot of books is to have become something of a scholar in this field. More instructive than any description of Mr. Morgan's library would be his own story of the process of getting it—his outlay of time and energy and money in familiarizing himself with the world of books, his costly mistakes, in short, that long series of lessons, that training in discrimination and connoisseurship which experience alone can afford. And from the point of view of the collector, this experience, vexing as it may often have been, is really the best part of it all. To have and to handle the books is pleasant; but keener still are the joys of pursuit, the disappointments from which one recovers, the losses ultimately turned into gains, the failures that become successes, the ignorance that is the beginning of wisdom.

But these delights, this edification, are to be had without a fortune. A man with a very modest income can, in a limited range, make himself an expert, and by watching his chances can pick up a collection of books that will represent a considerable expenditure, if not of cash, at least of intelligence and taste. The world of a book collector is wide, and even a small corner of it assiduously cultivated may yield a rich return in instruction and pleasure. Collecting American authors is a pastime that attracts a number of Americans; but the Victorian poets and novelists, or the writers of the early nineteenth century in England, or of the eighteenth or the seventeenth, offer abundant material that is intrinsically interesting and valuable as literature. In French literature—as in Italian, Spanish, or German—the opportunities are equally numerous; and a man who would supplement a good general library with one or two specialties, so to speak, need never be at a loss for an agreeable hobby. Nor is it necessary for the collector to possess that last rare item in his particular line. If you are looking for American authors, your set of Hawthorne may be very interesting without "Fanshawe" (1828) in the original boards, uncut; and in that striking group of Englishmen of the early nineteenth century Lamb's "King and Queen of Hearts" (1805), with the pink paper covers dated 1806, is not indispensable; nor is Shelley's "Address to the Irish People" (1812). The collector with a good fortune—in both senses of the word—may attain these heights, but far short of them happiness may be found.

For it must be remembered that the interest in an old book often lies, not so much in its absolute rarity as in the associations connected with it. In this respect it is like an old house or an old city, rendered venerable and fascinating by long human occupation. The handsome new reprint, fresh from the press, may be an admirable example of the book-manufacturer's art, but it lacks the charm of a volume which has gladdened the eyes of several generations of readers and perhaps bears upon its leaves some trace of their appreciation. We know a man who once bought for a mere trifle the "Memoirs" of Gibbon, edited by Lord Sheffield (1827), and on a fly-leaf discovered to his great surprise Scott's autograph, entirely overlooked by the book-seller. Who would not regard Scott's copy of Gibbon's Life more entertaining than any other? But even when the former owner is a nobody or is unknown, we cannot remain wholly indifferent to him; for is he not an intellectual brother, a sharer of our likes and dislikes? May we not almost visualize his face and touch hands with him across the dim centuries? For us, at least, the most attractive volumes of the old essayists are those of the *Lounger*, by Henry Mackenzie, "the Northern Addison"—and all because our set of the *Lounger*, not a first edition, was once owned, as a delicate signature on the title attests, by "Barbara Cockayne." Could such delicious vocables describe any but the most gracious figure of wo-

manhood? Who was Barbara Cockayne? We do not know. For a hundred years, doubtless, her bones have lain forgotten in some quiet English churchyard. But these were once Barbara Cockayne's books; and their yellowing pages render us oblivious to Christopher North's savage cut at "Old M." as "the greatest nuisance that ever infested any Magazine." And here even the thinnest humor, pathos, and moralizing must still appeal to all who, like the youth of whom Stevenson tells us, are moved by love of lovely names.

RECENT FRENCH FICTION.

PARIS, November 27.

"Patrice," a romance—not a novel—by Ernest Renan, would have been an event in the lifetime of the author (Calmann-Lévy). Now, it is little more than a continuation, from the sentimental side, of the autobiographical notes of an undulating intellect. The limpid, deliciously shaded style flows here over unexpected shallows and depths. Those long familiar with it may find almost equal interest in the illustrations by the son, Ary Renan, who died before realizing his full talent as a painter. "Ragotte," by Jules Renard of the Goncourt Academy, is likely to be the classic story-telling book of the year (A. Fayard). It is scarcely fiction, but rather a series of dry-points, etched instantaneous portraits of men and things in the lives of our *frères farouches* (shy brothers)—peasants and lowly people with difficult, yet at times thrillingly pertinent, utterance. In matter of style, this writer seems to have attained absolute adequacy. The color, the poignancy of mere bits of dialogue, lift his communication of thought and feeling to high art. Moreover, it brings us understandingly face to face with human beings like ourselves, but often misunderstood because inarticulate.

"Les Toits rouges," by Gaston Rouvier, is a very modern and readable novel by an author who has kept all the *actualité* and movement of his former high-class journalism (Fasquelle). The story turns round the fecund idea which Paul Bourget set afloat in "L'Étape"—the danger of leaping from a lower social rank to a higher without passing by the intermediate stages. The *parvenu* proprietor of a red-roofed manufacturing centre thinks he has reached his ambition's aim when his riches have persuaded the impoverished noble lady, who owns the neighboring château, to marry him. "Illusion masculine," by the lady (Madame A. Cherbonnel) who signs Jean de La Brète, is likely to be among the best sellers of the season, like the other novels of this writer, for people who appreciate readable books which they can leave on the family table (Plon-Nourrit). Madame Gabrielle Reval, in "Les Camps-volantes de la Rivièra," is, as usual, not so heedful of the young person and the conventionalities which surround her still in most French families (Calmann-Lévy). This lady won literary distinction by her first books, revealing life in the higher normal school for women at Sèvres, where she was trained, and in the women's *lycées*, where she was professor—both things new and revolutionary in France. Enlarging her sphere of freedom, she now elucidates that world of cosmopolitan interlopers which has its centre at Monte Carlo.

So far as impression goes, it would seem that the proper romance and novel of average people is coming to the front. There are no doubt commercial reasons for this; but it would be unfair not to see in it a change in the reading public. Probably the new generation differs in character from the old—is less Parisian. For the Petite Bibliothèque des Familles Paul Margueritte writes "Ma Grande" (big sister). Henri Doris shows in "La Grande Déesse"—who is Poverty—how an impoverished marquis is led to develop genius and attain to happiness, and so again to riches (Plon). Mathilde Alaric, in "La Romance de Joconde" (Plon), gives an honest instance of the words of that old song

> . . . on revient toujours
> À ses premières amours!

"Le Maître du pain," by Lucy Achalme, is quite as much an instructive study, as a novel, of the family community which still exists in Auvergne (Bouville). The lady who signs Pierre de Coulevain (Mademoiselle Favre) became widely known to Americans by her novels about their European experiments; her new novel, "Au Cœur de la vie," is told in an ultra-cosmopolitan way, from varying Continental cities. René Thiry has something rare in recent French novels, a distinctly humorous story of practical meaning—"Monsieur Gendron va au peuple"—how a *bourgeois* tried to be a Socialist (Plon).

Among books more in line with the foreign tradition regarding the French novel, Madame la Baronne Aimery de Pierrebourg, who has won a high place in letters under the more plebeian signature of Claude Ferval, publishes "Ciel rouge"—a story of high and impassioned sentiment. The mother who sacrifices herself to her love for her child, and so finally quenches the husband's hatred, is as ancient as Andromache, but modern enough for any one in this new version. "L'Amour guette" is the joint work of the author of "Amitié amoureuse," and Jean de Fossendal (Calmann-Lévy). Paul Bourget, in "Les Détours du cœur," gives a number of those short and sometimes tragical stories of passion treated psychologically, which many of his earlier faithful prefer to his longer social romances. With plenty of passion also, as Balzac understood it, with abundance of personages and incident and anecdote, a young writer who should be noted, Pierre Villetard, publishes his second novel—"La Montée." It is the ruthless scramble of a mother and son toward fortune and the great world (Fasquelle). "Da'ad," by Chékri Ganem, who must be an Oriental, simmers and seethes with the passion of the Orient amid much local color.

S. D.

NEWS FOR BIBLIOPHILES.

Wilberforce Eames has contributed a bibliography of that famous New England book "The Redeemed Captive Returning to Zion," to the reprint just published by the H. R. Huntting Co. of Springfield, Mass. This "Faithful History of Remarkable Occurrences in the Captivity and Deliverance of Mr. John Williams." is one of the most interesting of the series of "Captivities," which are much favored by collectors. Of the first edition, "Boston in N.E. Printed by B. Green, for Samuel Phillip, at the Brick Shop, 1707," Mr. Eames locates four copies in public libraries: American Antiquarian Society, Worcester, Harvard University, Massachusetts Historical Society, and John Carter Brown Libraries. Brinley's copy sold in March, 1879, for $106. Of the second edition, Boston, T. Fleet, 1720, Mr. Eames locates only a single copy, in the Lenox Library. Later editions were published at Boston, 1758; New London, no date, but 1773; Greenfield Mass., 1793; and Boston, 1795. This reprint is made from the last mentioned, which is called the sixth edition on the title-page. There were also several nineteenth century editions.

In the *Nation* for September 3, a list of several books of William Butler Yeats, which were first printed in America, was drawn from copies belonging to John Quinn. Those notes were taken from descriptions of the books prepared for the Bibliography of Yeats, by Allan Wade, intended for publication in the last volume, just issued, of the limited edition of Yeats's collected works. Sixty copies of the bibliography have, however, been printed separately, at the Shakespeare Head Press, Stratford-on-Avon, forming an octavo volume of 96 pages. Part i is a list of the books entirely by Yeats, with collations and notes beginning with an account of "Mosada, a Dramatic Poem," which first appeared in the *Dublin University Magazine*, June, 1886, and of which a few copies were taken off separately. The prologue to "The King's Threshold," which was printed in the *United Irishman* (but not with the play as published in book form) is here given entire. Part ii is devoted to books edited by or contributed to by Yeats; Part iii, a chronological list of his contributions to periodicals; and Part iv, American editions.

Robert Hoe has printed, uniform with the previous volumes of the catalogue of his magnificent library, a catalogue of his Books of Emblems. This is a volume of 133 pages, describing upwards of four hundred books. As Mr. Hoe states in his prefatory

note, "the most ardent and learned student of this class of literature and art combined was Henry Green, author of 'Shakespeare and the Emblem Writers' and 'Andrea Alciati and His Books of Emblems.'" Mr. Hoe acquired the manuscript lists and data left by Mr. Green at his death, recording about three thousand books of emblems, and he suggests that the printing of this bibliography would be a valuable contribution to the knowledge of this department of literature.

On December 21 and 22 the Anderson Auction Company of this city sells a selection of books from the library of Prof. Brander Matthews, largely relating to the history of the stage. A copy of the rare first edition of J. P. Kemble's "Fugitive Pieces," York, 1780, is included. In the McKee copy of this book there was inserted a letter from Kemble, in which he wrote:

> I did, indeed, put that nonsense to the press: but let me do myself the credit to say that I ran the very morning I saw it in print, to suppress it, and unfortunately was too late to prevent the sale of those few copies which I so earnestly wish to send to the flames after all the rest of them.

Lowndes tells of £15 being paid for a copy in a sale in which the author was the under bidder, but the book, though rare, is now of much less value.

The important items in the sale of the second part of the Poor library at Anderson's in this city December 7, 8, and 9, brought good prices. The following are a few of the more interesting: Hayman's "Quodlibets Lately Come Over from New Britaniola, Old Newfound-land" (1628), an inferior copy, the McKee copy which sold for $61 in 1900, $75; Bryant's "White-Footed Deer" (1844), original covers, uncut, $285 (the record price); George Eliot's "Legend of Jubal" (1874), one of twenty special copies on thick paper, with interesting A. L. S. referring to it, $57; Hawthorne's "Celestial Railroad" (1847), second edition, $45; Longfellow's "Ballads" (1842), a presentation copy, but name of recipient cut out, $54; Lowell's "Il Posceballo" (1862), earliest issue, $60; "Waverley" (1814), first edition, gilt edges, $49; "Ivanhoe" (1821), first edition, uncut, $35; Tennyson's "Poems by Two Brothers" (1827), with the names of the authors of the poems marked in by Alfred Tennyson, $600; Tennyson's "The Sailor Boy" (1861), one of twenty-five copies printed separately as a small pamphlet, $305; programme of the private theatricals given February 24, 1862, at the opening of Thackeray's new residence at Palace Green Kensington, the celebrated "W. Empty [W. M. T.] House Theatricals," accompanied by five pencil drawings by Thackeray and a lock of his hair, $655; Montaigne's "Essays" (1603), translated by John Florio, first edition, with both sets of errata leaves, very fine copy, $561 (the record price); the third edition (1632), $58; and Killigrew's "Comedies and Tragedies" (1644), $330 (the record price).

Reports on a few books sold at the dispersion of the first part of the library of Lord Amherst have been received by cable. Vol. I only (the old Testament) of the Gutenberg Bible, brought £2,050, a high price for a fragment. Of the twenty-seven known copies printed on paper, four have Vol. I only, while one has Vol. II only, and of the eleven copies on vellum, one lacks Vol. II. J. P. Morgan owns one of the odd volumes (the first) acquired with the library of Theodore Irwin of Oswego. He also owns a complete copy on vellum. Dr. Schwenke, the latest authority, has estimated that the total number of copies printed on paper may have been 180 and on vellum thirty. The book is so large and imposing that the number which have survived cannot be regarded as a large proportion. King Charles the First's copy of the Authorized Version of the Bible, Cambridge, 1638, bound in red velvet, the sides and backs richly embroidered in ornaments of silver thread in high relief, brought £1,000; the *editio princeps* of Cicero, printed at Mainz by Fust and Schoiffer, in 1465, £700; George Best's "True Discourse of the Late Voyages of Discoverie for the finding of a passage to Cathaya," 1578, with the two maps genuine (most copies lack the maps) £315, a low price.

At Hodgson's auction in London in the latter part of November, the *editio princeps* of Homer (with the rare preliminary leaves), 2 vols., Florence, 1488, sold for £250; "The Comedye of Acolastus," translated by J. Palsgrave, 1540, £49.

Correspondence.

DIFFICULTIES IN THE WAY OF COÖPERATION IN ENGLISH.

To the Editor of The Nation:

Sir: The recent meeting of the New England Association of Teachers of English at Springfield for the purpose of discussing coördination and coöperation in English must have brought to the minds of many English teachers renewed question as to the need and possibility of coöperation and the reason for the difficulties that beset those who seek to bring it about.

A speaker at Springfield attributed the hampering inertia of his colleagues to a lack of respect for the English department, due, in his estimation, to the relatively small amount of time given to English in New England high schools. The trouble lies, I fear, much deeper. For years English has been taught in the schools from the point of view of form. Form and content, things to be sharply divorced in discussion only, have been and are to-day practically treated as separate entities. Weekly, fortnightly, or less often, the pupil writes a theme for his English teacher. The subject is assigned by the teacher, or sought, as a rule with some toil, by the pupil. One is reminded, in this connection, of a story told of that time-worn figure, the learned college professor, found wandering alone about the drawing room after his hostess's well-intentioned effort to effect a connection with another guest. "I hoped you and Mrs. S. would find common interests," was her greeting. "Mrs. S.," he replied gravely, "seemed to have no statement that she wished to make to me, and I had none that I wished to make to her, so we parted." The English student is less fortunate; willy nilly he must make a statement—he cannot part from his English teacher. This is, of course, an extreme putting of the case; many English teachers throughout this broad land are able to give to many boys and girls the will to think and to express their thought. But too often the English theme is a mere empty means of training in form. As a result, the high school graduate enters freshman English with a fair theoretical conviction that the "rules" of unity, coherence, and emphasis should be applied to his written themes; that they are principles that should govern his ordinary thought and speech he never dreams. He has no confirmed habit of disciplined thought and expression.

Meantime the student finds himself in other branches of his work inevitably led, day by day, to find expression for the material that they afford. Day by day he recites in class, writes this or that for the teacher of science or history. Usually he feels free to express himself as his native, untrained inclination wills. The teacher passively regrets, it may be, or actively blames the teacher of English, if his substance is incoherently presented; but the point is "knowledge of the subject matter, not form," and "there is no time to correct poor English." "It is not fair," he adds, "to take from a pupil's mark for chemistry if he has given the facts correctly." Again and again this point is made, without, apparently, the slightest realization of the fact that *mastery* of subject matter implies of necessity coherent thinking and thereby coherent expression; that tolerance of incoherent presentation encourages a mere cramming of undigested matter and breaks every law of mental discipline.

Psychologically, the stand which teachers of English have taken during the past years is unsound; no habit of clear expression can be formed in one-tenth of the time when nine-tenths encourage constant departure from it. Training in *method* of thought, in *method* of expression, in idiom, the English teacher can and must give; that in the division of labor is his peculiar task. But until he demands earnestly, steadily, the aid of those who alone can see to it that his teaching puts itself into practice; until he recognizes definitely that English is a tool, to be moulded and mastered under his direction, but to be put to its proper use and kept sharp and efficient only through the watchful care of many others who supply varying material for its exercise, he cannot do effectlve work. How can we hope to overcome the lack of respect that subtly, insidiously, follows the teaching of English through high school and college while we willingly pursue a policy theoretically wrong, and practically, by its works, proved ineffective?

Obviously, however, there are two sides to the question of coöperation. The English teacher must make the demand; but it is impossible for him to secure it unless teachers of other subjects can be induced to give their aid in a spirit of disinterested helpfulness. Prof. J. H. Gardiner of Harvard stated the issue with marked definiteness and fairness at the Springfield meeting: "Every student"—I quote freely—"owes to the instructor in every other branch as good English as he gives to the teacher of English; every teacher owes to every student an insistence upon the best that he is capable of giving. Any teacher who permits a pupil to hand in to him slipshod, incoherent English does the pupil a wrong, fosters in him those vicious mental habits of laziness and carelessness which it should be the prime aim of education to eradicate." Too few teachers seem keenly alive to this truth; here lies the fundamental difficulty in the

way of securing effective coöperation between English and other departments. If, as Professor James has said, education consists in substituting good for bad ideas, good for bad habits, all with a view to their practical application, teachers fail all along the line when they take the attitude of having too little time to teach more than so much subject matter, when they refuse to discipline a student for disordered, slovenly expression. In the haste of the daily routine it would seem that we all lose sight of the larger issues involved in such a question as that of coöperation in English. Were our aims less petty, less specialized, more largely adequate, we should see the detail in its wider significance, and, perhaps, prove ourselves educators, teachers, with one will, of human beings, where now we are mere divided instructors in subjects—English, chemistry, history.

How this coöperation is to be worked out is another question. Tentative efforts are being made at Harvard, Vassar, Mt. Holyoke, Wellesley, and in high schools here and there; a fairly successful scheme has been for some years in practice at the Institute of Technology. English papers involving subject matter belonging to other departments and counting in both; special English classes to which those found deficient may be detailed by any department; a strict holding to account for the English of prepared and examination papers and a return to the English department of those markedly deficient; inter-department meetings with a view to mutual understanding and usefulness—all have been tried more or less consistently in various places. So much only may be said: it seems fairly certain that the idea which makes every man a master of English as well as of his own subject is not yet realized, nor is it likely to be in our present system of specialization. Under those circumstances we do not, in advocating such a policy, doom ourselves to extinction; the English department is still the clearing house for the school or college—or the indispensable handmaid, if you will. Coöperation on the part of other departments is likely to consist largely in a willingness to reduce the present incubus of written work by encouraging papers common to two departments, in holding students strictly to account for oral as well as written expression, and in reporting those found markedly deficient to the English department for discipline and drill. If this seems to place a large burden upon the shoulders of teachers of English, it may be added, with an appeal to experience, that nine-tenths of the slipshod, desultory English now handed to teachers of other subjects, is due to carelessness: boy and girl will inevitably follow the line of least resistance if no one bids them stop, while, brought to a halt, they live up to their best. The small boy quoted by a Springfield speaker was not far from wrong when he explained, *àpropos* of *his* woodchuck, which had climbed a tree—"I know they can't, but this one did. You see he had to." A willing spirit of cooperation throughout all departments would, I believe, far more simply and easily than one thinks, do away with practical difficulties, and lead to more efficient English in both school and college.

AGNES F. PERKINS.

Wellesley College, December 2.

DEAN BRIGGS ON COLLEGE PREPARATION.

To the Editor of The Nation:

Sir: Mr. Abraham Flexner, contending in his exceptionally interesting little book, "The American College," that college admission examinations are deadening, remarks:

> In the light of these facts one can understand a somewhat startling statement in a recent annual report [1901-02, p. 96], by Dean Briggs: "Of any two subjects, efficiently taught for the same length of time, one is about as good as another, and deserves equal recognition in a scheme of examinations." For, clearly, when half a dozen different studies have been each purged of its characteristic essence by way of preparation for examination, then, I grant you, all being equally insipid, "one is about as good as another." But now that one thing is about as good as another, provided only it is as efficiently taught for the same length of time, why should schools be put to the trouble and expense of providing a varied diet? If all foods masticated for equal periods are equally nutritious, is not a changing, well-ordered menu a sheer extravagance? Dean Briggs argues just the other way around; if one food is about as good as another, why should a housekeeper *not* keep an abundant table? If one study is about as good as another, why should a school not provide limitless variety? But the argument is wholly fallacious. A developing civilization wants physics, philosophy, poetry. It has no way of substituting one for the other; hence, it values them alike. Pedagogically, however, their value depends on entirely different considerations. It is not simply a question of how long or how thoroughly a subject has been taught. The mere fact that Roman history and American history have been taught with equal vigor for equal school periods does not make it immaterial which a particular American boy knows. English literature and Egyptian hieroglyphics cannot be made of equal value to a high-school boy by teaching them equally long with equal efficiency.

The passage in Dean Briggs's report to which Mr. Flexner refers is a discussion of the old and new methods of admission to Harvard College. My interpretation of it differs somewhat from Mr. Flexner's:

> The chief difference of training in the two methods is for those candidates who do not offer Greek: under the old method, such candidates made up for Greek by additional mathematics; under the new method they make up for it by any subjects covering the same total number of points in the admission scheme. The old method recognized two sorts of intellectual discipline (corresponding to two great orders of intellect), the linguistic or literary and the mathematical: to the first it gave more weight; but it conceded that some deficiency in the first might be balanced by an additional amount of the second. Its advocates believed that modern languages and natural science, as at present taught in schools, do not provide firm training for the mind, and that the fault is not wholly in the teaching, but lies partly in the unsettled character of the subjects themselves. The new method proclaims that of any two studies efficiently taught for the same length of time one is about as good as another, and deserves equal recognition in a scheme of examinations. It is too early to judge whether students admitted with neither Greek nor trigonometry and solid geometry are on the whole weaker than those admitted with either or with both; too early to judge whether the training of the new subjects can match the training of the old. Yet these are among the questions that rouse in conservative minds a grave apprehension.

Whether Dean Briggs says what Mr. Flexner says he says, the intelligent reader may determine. L. B. R. BRIGGS.

Cambridge, Mass., December 9.

ANNIVERSARY OF THE UNIVERSITY OF LEIPZIG.

To the Editor of The Nation:

Sir: During August, 1909, the University of Leipzig is to celebrate its five hundredth anniversary. It would be eminently fitting for the Americans who have taken their doctor's degrees at Leipzig to send to the university on that occasion some formal address of congratulation. A list of about one hundred Americans who have taken their degrees at Leipzig has been prepared, including all of the names of American scientists mentioned in "American Men of Science" and such others as could be secured from a few former Leipzig students in the vicinity of New York and New Haven.

A small committee has organized itself in an informal way for the purpose of collecting suggestions and information. If the movement seems to be of interest, a more formal organization can be perfected later and the congratulatory message can be issued by a representative committee. The undersigned, acting as secretary for the preliminary informal committee, begs leave to request (1) suggestions with regard to the mode of procedure which would be most effective in presenting to Leipzig University the expression of congratulation from former American students; (2) information with regard to Americans in all departments who have received their degrees at Leipzig. The present list is complete for all names included in "American Men of Science"; it is otherwise very fragmentary and should be supplemented even at the risk of duplicating names from various sources.

It is requested that replies be sent at the earliest possible moment in order that the organization may be completed before January. For the Committee,

CHARLES H. JUDD.

Yale Station, New Haven, Conn., December 7.

KNOWLEDGE OF MILTON IN EARLY NEW ENGLAND.

To the Editor of The Nation:

Sir: At the recent tercentenary of John Milton, held in Boston under the auspices of the Massachusetts Historical Society, it devolved upon the writer to make some introductory remarks.

Milton was essentially the poet laureate of the Puritans, and Massachusetts, conceived in Puritanism, was, *par excellence*, the Puritan colony of the English Commonwealth. Naturally, therefore, some indications were looked for in the early records of Massachusetts as a community, of influence exercised by Milton, and for evidence of any general early familiarity with him or with his writings. The "Paradise Lost" was published in 1667; Milton died seven years later, in 1674. Almost exactly a century from the last date, Massachusetts emerged from its chrysalis stage, and, no longer a province, became itself a commonwealth. Addison's famous series of *Spectator* papers, which contributed so largely towards familiarizing the English-speaking races with the one acknowledged classic of the Puritan period and régime, appeared in 1712.

Yet a fairly exhaustive search failed to reveal any indications whatever of early New England familiarity with Milton, or

of quotations from him in the New England literature, such as it was, prior to 1750. That literature is, of course, chiefly theological, consisting largely of sermons, occasional discourses, etc., in which, here and there, references to Milton appear. Rarely, however, are they to his poems. There is no indication in the "Magnalia" that Cotton Mather had read "Paradise Lost"; nor has any quotation from Milton's poems, whether of the earlier or later period, been found, so far as has yet appeared, in the numerous publications of the Mather family. There is none in Sewell's Diary.

Apparently, so far as investigation has yet disclosed, Milton's poems were almost unknown in New England until about the middle of the eighteenth century. There is no well-authenticated case of a copy of "Paradise Lost" on a Massachusetts bookshelf before that period yet brought to light.

From about the year 1750 to the beginning of the nineteenth century there is abundant evidence of growing familiarity. During the greater part of the nineteenth century, as is familiar to the experience of almost every one, the "Paradise Lost" was practically a text-book. Children were compelled, as an exercise, to commit long passages of it by heart; but during the last third of the nineteenth century this practice passed more and more into disuse.

A more careful investigation is now being made, and any data, bearing upon American familiarity with Milton and his poems during the first half of the eighteenth century, are desired. No edition of "Paradise Lost" was published on this side of the Atlantic until after 1775. The first Massachusetts edition appeared in 1794. Can individual copies of English editions of an earlier date be produced, the use of which in America, prior to 1750, is matter of proof, or even great probability? CHARLES FRANCIS ADAMS.

84 State Street, Boston, December 15.

"JOHN LEE IS DEAD, THE DEAR OLD MAN."

TO THE EDITOR OF THE NATION:

SIR: Not long ago I discovered in the little churchyard at Mathern, near Chepstow —a village not far from Bristol, and familiar to many Americans, I dare say, through its castle ruins overlooking the Wye—the grave of John Lee, who died there in May, 1825, at the age of one hundred and three. On the tombstone are inscribed the following lines:

> John Lee is dead, the dear old man,
> We ne'er shall see him more.
> He used to wear an old drab coat,
> All buttoned down before.

At first sight it seemed to me possible that these lines had antedated those of Albert Gorton Greene, the author of "Old Grimes," and that they had even suggested the poem to him; nor was I able to get definite data in such publications as "The Library of American Literature" to prove the exact date of Greene's composition. In Griswold's "Poets and Poetry of America" (1842), however, "Old Grimes" is referred to and reprinted, and it is stated that it was written by Greene in the year in which he entered Brown University. Greene (1802-1868) was graduated from Brown in 1820, and I assume that he must have written "Old Grimes" about 1816, or some nine years before it was adapted to the melancholy needs of John Lee of Mathern. Does any reader of the *Nation* know the exact year of the poem's composition?

J. PERRY WORDEN.

Bristol, England, December 3.

NEGRO LABOR IN THE SOUTH.

TO THE EDITOR OF THE NATION:

SIR: In your editorial mention, December 10, of Mr. Taft's speech to the North Carolina Society you say:

> Expatriation of the negro is, as he [Taft] pointed out, impossible, and so is the repeal of the Fifteenth Amendment. On neither of these proposals need anybody waste a breath. The negro must remain, if only because the South cannot do without his labor.

Expatriation is difficult, but the only humane and satisfactory solution of the race question, in my judgment. The repeal of the Fifteenth Amendment is not to be expected, I admit, and I never seriously discuss what I know is impossible.

However, it is to the last of your three statements that I now address myself very briefly. In your eagerness to defend the negro you fail to do justice to the white people of the South. You say that "the South cannot do without his [the negro's] labor." Now, Mr. Editor, are you sure that you are right? A recent estimate of the cotton crop now being marketed puts the yield at practically thirteen million bales, of which vast total Texas is set down as having produced approximately four million bales, or a little less than one-third of the entire yield. Of course, I cannot be exact in the statement I am about to make, but I do know that I am not far off the fact when I say that of the entire crop of cotton made in Texas more than 80 per cent. is planted, cultivated, and harvested by white labor. I am told by colleagues from the South that in the "hill country" of Mississippi, Alabama, Georgia, Arkansas, and the Carolinas the major portion of the cotton crop is made by white labor. What is here stated with reference to the cotton crop applies in an equal degree to all other Southern crops, except sugar and rice, that are of minor importance. Under these circumstances how can you say that the South "cannot do without the labor of the negro?"

Millions of white men who labor in the Southern fields are prosperous and healthy, notwithstanding the contrary view of people who study our conditions at long range.

JAMES L. SLAYDEN.

House of Representatives, Washington, D. C., December 14, 1908.

THE ABBOT AT FARNBOROUGH.

TO THE EDITOR OF THE NATION:

SIR: In your issue of November 26 (p. 512) your Paris correspondent speaks of "L'Angleterre chrétienne avant les Normands," by Dom Fernand Cabrol, abbot of Farnborough, England, of an exiled French community of Benedictines. Some of your readers may be under the impression that this Benedictine community was transplanted from France as a result of the recent action of the republic. It was established there before the contest broke out between the republic and the church, as guardian of the mausoleum which the Empress Eugénie erected over the tombs of her husband and her son. Their bodies were removed from Chiselhurst to Farnborough, when she occupied the large estate which she purchased in that neighborhood, where she still lives.

JAMES DOUGLAS.

New York, December 4.

Notes.

The Oxford University Press (Henry Frowde) does a good service in printing a selection of the "Poems of John Clare," edited and provided with an introduction by Arthur Symons. Clare, the reader may need to be informed, was born of a peasant family in Helpston, in 1793. His first impulse to write came from reading a chance copy of "The Seasons." His first book of verse was "Poems Descriptive of Rural Life," brought out in 1820 by Taylor and Hessey, Keats's publishers. It was praised by the *Quarterly*, which had just attacked Keats, and thenceforth Clare was a servant of the Muses—and of poverty. In later years he went mad from drink and exposure, and his whole life was one of disappointment and misery. Mr. Symons furnishes an excellent account of Clare's work, showing in what way it differs from the work of Bloomfield and Burns, and bringing out its rarer qualities. Our best comment on him is to quote one of the most perfect of his poems, "The Dying Child":

> He could not die when trees were green,
> For he loved the time too well,
> His little hands, when flowers were seen,
> Were held for the bluebell,
> As he was carried o'er the green.
>
> His eye glanced at the white-nosed bee;
> He knew those children of the Spring:
> When he was well and on the lea
> He held one in his hands to sing,
> Which filled his heart with glee.
>
> Infants the children of the Spring!
> How can an infant die
> When butterflies are on the wing,
> Green grass, and such a sky!
> How can they die at Spring?
>
> He held his hands for daisies white,
> And then for violets blue,
> And took them all to bed at night
> That in the green fields grew,
> As childhood's sweet delight.
>
> And then he shut his little eyes,
> And flowers would notice not;
> Birds' nests and eggs caused no surprise,
> He now no blossoms got;
> They met with plaintive sighs.
>
> When Winter came and blasts did sigh,
> And hare were plain and tree,
> As he for ease in bed did lie
> His soul seemed with the free,
> He died so quietly.

It gives one a curious sensation to pick up an old leisurely classic with all the air of conservative age about it, and find the work turned into an instrument of advanced propaganda. Such a fate has happened to Sir Thomas More's "Utopia," written in Latin some four hundred years ago, and translated into English of the day by Ralph Robinson. Now Valerien Paget has changed Robinson's stately periods into current diction and published the work as "More's Millennium," with the John McBride Co. We have no objection to the translator's modern dialect—it is good English—though

we think he makes altogether too much of what he calls Robinson's "Mediævalism," and we trust it will hasten the millennium which he seems to foresee.

The two latest volumes of the New York edition of "The Novels and Tales" of Henry James (Charles Scribner's Sons) are devoted to short pieces. Volume XIII contains "The Reverberator," "Madame de Mauves," "A Passionate Pilgrim," "The Madonna of the Future," and "Louise Pallant"; Volume XIV, "Lady Barbarina," "The Siege of London," "An International Episode," "The Pension Beaurepas," "A Bundle of Letters." and "The Point of View." In the preface to Volume XIII Mr. James tells us that "before the American business man . . . I was absolutely and irredeemably helpless, with no fibre of my intelligence responding to his mystery." Volume XIV contains "several short fictions" of the type which Mr. James calls "international." "A Bundle of Letters," he informs us, "was written in a single long session, and, the temperature apart, at a 'heat.'" The most interesting passage in this preface is a reminiscence of his life in London:

> I liked to think that Thackeray's Curzon Street, in which Becky Sharp, or rather Mrs. Rawdon Crawley, had lived, was not much further off; I thought of it preponderantly, in my comings and goings, as Becky's and her creator's; just as I was to find fifty other London neighborhoods speak to me almost only with the voice, the thousand voices, of Dickens.

No Christmas should pass without notice of Dickens, and we have on our table two books addressed to lovers of that author. One is "The Wisdom of Dickens," collected and arranged from his writings and letters by Temple Scott, and published by Mitchell Kennerley in a small volume neatly bound in green leather. The other is a large volume imported by Scribners, "Scenes and Characters from the Works of Charles Dickens." It consists of eight hundred and sixty-six drawings by Fred Barnard, Hablot K. Browne, and the other well-known Dickens illustrators, printed from the original woodblocks which were engraved for Chapman & Hall's Household Edition. The impressions are remarkably clear, and to turn over the pages is to see the whole of Dickens in dumb show, so to speak, a rare entertainment.

Dr. Crothers's "By the Christmas Fire" (Houghton Mifflin Co.) will be welcomed by those in search of a gift book whose dress is appropriate to the season, but whose spirit is appropriate to all the year. Though one involuntarily associates this essayist with a rock-bound coast, there is a smiling sobriety in his work, a penitential quietness as of a Puritan on a holiday. Simple, limpid, refined, his style is enlivened by a mild-hearted humor, and elevated by a reticent idealism—*puro tamen fonti quam magno flumini proprior.* When one compares him for a moment with an elder humorist bent over his musty folios with his two wax candles and his glass of gin-and-water, one wonders what part nature, what part theological frosts of New England, have played in denying us an Elia of full-hearted gayety and abundance. Yet the faint tinge of a Sunday night talk in these five essays we should not wish away; it is a necessary part of their quality. The moral kernel of these pleasant disquisitions is sound and sweet. The power of the reasoning will over "natural law" in "The Bayonet-Poker," the distinction between the geometrical moralist and the wisely flexible idealist in "On Being a Doctrinaire," the necessity of maintaining one's independence under the tyranny of printed pessimism in "Christmas and the Literature of Disillusion," the necessity of wonder in any scheme of philosophy in "The Ignominy of Being Grown-Up," the superiority of justice to pity in "Christmas and the Spirit of Democracy"—all these are fair food for reflection by the Christmas fire. Few holiday books are so well worth while as this; there is something permanently winsome in its chastened hopefulness.

A fairy book of original conception is "King Time, or the Mystical Land of the Hours," by P. K. Fitzhugh (H. M. Caldwell Co.). A little boy sits before a clock and wonders what becomes of the minutes as they are ticked off, and, wondering, he falls asleep and is carried to the mystical land of King Time and sees strange things, among them a war between the Duke of Procrastination and the King. The story is told in verse and prose; the illustrations, in color and in black and white, by L. J. Bridgman, suit the excellent fancy of the tale.

A book of information which may be safely recommended is Helen A. Clarke's "Child's Guide to Mythology" (Baker & Taylor Co.), in which the legends are grouped together, not by countries, but by subjects, *e. g.*, "Tree and Plant Myths," "Myths of the Sky and Air," etc. Miss Clarke tells the old stories in simple and good English.

Mrs. Bearne has added another volume to her anecdotal histories of France (Brentano's). This time she has chosen to write of "A Royal Quartette," taking for her theme four ladies, whose lives extend from the latter part of the reign of Louis XIV to the second quarter of the nineteenth century. Her heroines are Marie Adélaïde de Savoie, Duchess of Burgundy, for a while the Dauphine of France; Madame Adélaïde, daughter of Louis XV, granddaughter of the earlier Adélaïde; Marie Luisa, Infanta of Spain, daughter of Carlos IV; and Marie Amélie Thérèse of Naples, wife of Louis Philippe, King of the French. Mrs. Bearne, as always, has a good scent for the telling anecdote, and in the present arrangement, especially, there is an added interest in the historical changes of such lives as we pass from the autocratic court of Louis XIV to the Paris of Louis Philippe.

"The Story of the New England Whalers" (The Macmillan Co.) is interestingly told by the well-known writer, John R. Spears, to whom nothing is unworthy of study which is both nautical and American. The beginnings and the disappearance of this industry, to which only the strong and courageous were eligible, are set forth in attractive form, as are the wonderful rise and the inevitable decline of Nantucket as the world's greatest whaling base. From this infertile island the trade reached out into the remotest seas. Nantucket, indeed, furnished experts in the art to neighboring ports and to the mother country as well; no less than 149 Nantucket captains commanded British whaling ships prior to 1812. The book should appeal to all who find delight in brave and skilful deeds, done in a peaceful cause.

A valuable contribution to the literature of the Civil War is to be found in the "History of the Forty-fifth Regiment, M. V. M." (printed by Wallace Spooner), compiled by Albert W. Mann. Known as the "cadet regiment," it took part in the operations about Newbern, N. C., and especially the battle of Kinston, in 1862-63. The book is not the story of one narrator, but a number of the officers and men give their varied experiences, so that one finds in it a graphic picture of the life of a nine months' volunteer. The volume is profusely illustrated with portraits and reproductions of sketches by the artist, Frank H. Shapleigh, who was a member of the regiment.

James Baker, long known as a contributor to English critical journals, proves a delightful writer of reminiscence in his "Literary and Biographical Studies" (London: Chapman & Hall). Mr. Baker has travelled much in England and on the Continent, and has more than one new tale of Friedrich von Bodenstedt, George Müller, Tennyson, and even Verestchagin, the Russian painter. In "The Home Life of Tom Macaulay" he can chat familiarly about the great historian, for Macaulay lived, for a year or two, very near to Mr. Baker at Clifton. Mr. Baker was also one of the privileged few to invade the secluded home of Blackmore, the novelist, in the outskirts of London, though even then the author of "Lorna Doone," through his dread of publicity, and a certain ill-humor due to physical suffering, forbade the discussion of certain topics while dispensing "pot luck." According to Baker, Blackmore regarded his translation of the Georgics as his best work, notwithstanding the fact that he could get no publisher for it until he had promised to foot the bills himself. The volume contains also a sympathetic review of Heine's "Memoirs," recollections of both Queen Victoria's funeral and that of Tennyson, and a profitable investigation of the books read by Coleridge and Southey, based on a recent discovery of the Bristol Library Society Register recording the intellectual pabulum dispensed to both poets.

The latest instalment of the "New English Dictionary," which has been prepared by Henry Bradley, contains words from Movement to Myzostomous, and completes Vol. VI. The customary table of comparisons shows 3,777 words in this section, where Johnson listed only 293, and 10,072 illustrative quotations where Johnson furnished 687. The mortality rate among the M's has been high; 19 per cent. of the "main words" are now obsolete. On the other hand, 5 per cent. have not yet been admitted to good and regular standing. Though the bulk of this collection is of Greek, and especially of Roman, pedigree, there is a considerable tincture of home-made Mulligrubs and Mubble-fubbles, Oriental Muezzins, Muftis, and Mullahs, American Muck-rakes, Mustangs, and Mugwumps, and other uncouth vocables which would have tickled the horrisonant tongue of Rabelais. It is interesting to note that Mr. and Mrs. are included as independent symbols, having lost their vowels and become emancipated from their Master and Mistress for good and all. In the sixteenth and seventeenth centuries Mr., we are told, was used for Master in any application of the word—one might hew a "Mr. root" from a tree: but eventually the abbreviated form was confined to its

present use; in the unaccented position the vowel was modified; Mr. became steadily more and more democratic, till its entire nature was transformed. There are many newly coined words here, intended for circulation among the learned—Myzostomous, for example, belonging to an order of "small worms parasitic on crinoids"; but such terms are of little interest to the layman or to one who reads dictionaries for the pleasure of historic associations. Much more piquant is our familiar Mugwump—a word spread wide by the critics of the bolting Republicans in 1884, but borne with greater honor by the Indian chiefs. It may be news to some Americans that the Rev. John Eliot, in his Indian version of the Bible, published in 1653, translated the word "dukes" in the phrase "dukes of the sons of Esau" (Gen. xxxvi, 15) by "Mugwumps." And how many of the younger generation have traced the newly popular Muck-rake back to Bunyan, whose "man with a Muckrake" symbolizes the quest in this vile world for filthy lucre? In the process of time the man with the muck-rake has come to mean one who has a "depraved interest in what is morally unsavory or scandalous"—thus, at any rate, the "New English Dictionary" defines the word. But does that quite cover the species even to-day? Surely the term extends, in compliment or otherwise, over those also who fall to with a will at cleansing Augean stables.

Some pretty German books for children are being published by Joseph Scholz of Mainz. The series called Deutsches Bilderbuch consists of the popular fairy tales in separate editions, large in size and containing, on the average, eight full-page and numerous smaller illustrations. German artists of reputation have aided in presenting most charmingly such old favorites as "Dornröschen," "Aschenbrödel," and "Schneewittchen." There are also books of legends, some of them told by poets like Eberhard Koenig. Some are illustrated by Arpad Schmidthammer, who recalls the robust humor of Wilhelm Busch.

Of the pictorial supplements to general history, literature, and science compiled and edited by German scholars, Könnecke's "Bilderatlas zur Geschichte der deutschen Nationalliteratur," with its facsimiles and portraits, has been one of the most useful aids to students. To bring it within the reach of the general reader a cheap popular edition has just been published under the title, "Deutscher Literaturatlas" (New York: G. E. Stechert & Co.). It is edited by Dr. Gustav Könnecke and prefaced by Dr. Christian Muff. There are 825 illustrations, many of them full page, besides a number in photogravure. The work has been brought up to date by the addition of portraits of contemporaneous authors.

Although published only in September, one of the best selling books in Germany is a posthumous volume of rhymes and drawings by the late Wilhelm Busch, entitled "Hernach" (New York: G. E. Stechert & Co.).

The little volumes published by Albert Langen of Munich and containing reprints from the famous *Simplicissimus* are excellent examples of the somewhat cynical humor of the modern German. But they are delightfully illustrated by artists like Reznicek, Gulbransson, Heine, Thoma, and others. "Der Backfisch" and the "Simplizissimus-Kalender" are typical of the kind.

One of the newcomers in the German publishing world, Hans von Weber of the Hyperion-Verlag, Munich, is challenging the attention of bibliophiles by his exquisite reprints, among them Chamisso's "Peter Schlemihl," Hebbel's "Judith," and a great number of translations from foreign languages. In typography, binding, and illustration each volume is a work of art.

Among the new reprints of German classics, Eckermann's "Gespräche mit Goethe in den letzten Jahren seines Lebens," from the original manuscript, edited with a postlude and an index by Dr. W. H. Houben (Leipzig: F. A. Brockhaus), is one of the most important. A new edition of the complete works of Immermann, in five volumes, revised and with a critical commentary by Harry Maync, bears the imprint of the Bibliographische Institut of Leipzig. Of a new edition in six volumes of Heinrich von Kleist's complete works and letters, edited by Wilhelm Herzog and published by the Insel-Verlag of Leipzig, the first volume has just been brought out.

A work in three volumes, containing an interesting correspondence, "Wilhelm von Humboldt und Caroline von Humboldt in ihren Briefen" (Berlin: E. S. Mittler & Sohn), is full of illuminating ideas about cosmopolitanism and bureaucracy and reflects the spirit of cultivated Germany in the first decade of the last century. The editor is Anna von Sydow.

An interesting series in German is the Bücher der Weisheit und Schönheit, edited by Jeannot Emil Freiherr von Grotthuss, founder and editor of *Der Türmer*. Each volume contains selections from the writings of one of the world's great men. The catholicity of the collection is remarkable. There is a volume of Beethoven's letters, edited and introduced by Dr. Karl Storck. There are selections from the writings and the letters of Frederick the Great, with some of his conversations with De Catt, edited by Fritz Lienhard. There is a book entitled "Was Goethe sagt," of which Dr. Theo. Achelis is the editor. Other volumes are drawn from the writings of the Grimm brothers, Lucian, Dante, Montaigne, Montesquieu, Gobineau, Darwin, and Kant. The latest addition to the series is a book by Dr. Otto Richter, on Fechner, whose influence upon the younger generation of German writers almost rivals that of Nietzsche.

"La Célèbre Inconnue de Prosper Mérimée" (Paris: E. Sansot) is completely elucidated by Alphonse Lefebre in her life and authentic works (for fictions have been built up around her), with a portrait and drawings from her hand. It has been known for some time that Jenny Dacquin, the Inconnue, took advantage of the loss of her letters when the house of Mérimée was destroyed during the Commune, to publish his letters to her in an expurgated form which shows the writer in rather a ridiculous light. Lucien Pinvert, in what seems to be a doctoral thesis, sums up in a considerable volume the latest that is known "Sur Mérimée" (Paris: Henri Leclere).

The able novelist Louis Bertrand, in a travel book full of real figures and color and written with a master's pen, describes what he actually has seen in "La Grèce du soleil et des paysages," without any classical posing (Paris: Fasquelle).

The New York Public Library is making a notable collection of German Americana. During 1906-7 it received 3,864 volumes and pamphlets of this character from 297 donors in 87 cities. As a result it points to a number of recent works prepared, from its material, such as Rudolf Cronau's "Das deutsche Element in den Vereinigten Staaten," which received the Conrad Seipp German memorial prize. The library asks for donations of old German letters, newspapers, periodicals, etc.

The University of Wisconsin has just received a valuable addition to its books for the study of the labor movement by the gift of the extensive library collected by the late Henry Demarest Lloyd. The collection is given to the university by the heirs of Mr. Lloyd, who are interested in the work of the American Bureau of Industrial Research, which has its headquarters in Madison, Wis. The Lloyd collection is particularly rich in material on trade unions, coöperation, socialism, municipal ownership, and monopolies.

At the annual meeting of the Ohio Library Association last month, the question of requiring by law that librarians shall bave proper State certificates as a condition of employment in public libraries, was a topic of interest. A form of law embodying the ideas of the legislative committee of the association was presented to the meeting, and after animated debate it was voted that this law should be recommended to the State Legislature. The proposed law would create a State library examining board, which should hold examinations, fix standards, and issue certificates to qualified librarians. As in the case of teachers, the certificates would be graded; and one year after the organization of the examining board, all persons holding positions in tax supported libraries must have a certificate. Exemption from the examination is made for librarians who have been employed for five years, and whose work is judged by the board as satisfactory.

H. E. Legler, secretary of the Wisconsin Library Commission, reports that libraries in that State have multiplied at such a rate, especially within the past five years, that there remains but one city with a population in excess of 3,000 unprovided. Of cities having a population of 1,500 or more, there are now but twelve without libraries.

The fifth annual meeting of the American Political Science Association will be held in Washington and Richmond, December 28-31. The programme includes the following papers: "The Limitations of Federal Government," Stephen Leacock, McGill University; "The Influence of State Politics in Expanding Federal Power," Henry Jones Ford, Princeton; "The Relations of Political Science to History and to Practice," the Right Hon. James Bryce, president of the association; "Ten Years' Rule in Porto Rico," W. F. Willoughby, secretary of Porto Rico; "Ten Years' Rule in the Philippines," James A. Le Roy, Fort Bayard, N. M.; "History and the Philosophy of History," George B. Adams, Yale, president of the American Historical Association; "Some Recent Tendencies in State Consti-

tutional Development," W. F. Dodd, Johns Hopkins; "Constitutional Revision in Michigan and the Middle West," J. A. Fairlie, University of Michigan; "Constitutional Changes in the New England States since 1900," Allen Johnson, Bowdoin; "The Constitution of Oklahoma," Robert L. Owen, United States Senator from Oklahoma; "The New York Public Service Commission," Milo R. Maltbie, member of the commission; "The Bureau of Municipal Research," the Hon. Henry Bruere, director of the bureau; "The Boston Finance Commission," J. Wells Farley, secretary of the commission; "The National Municipal League," the Hon. Clinton Rogers Woodruff, secretary of the league; a round-table conference on "Methods of Instruction in Municipal Government," conducted by the National Municipal League's Committee on the Coördination of University and Collegiate Instruction, William Bennett Munro, Harvard, chairman, the discussion to be opened by F. J. Goodnow, Columbia; "The Increase of Federal Power under the Commerce Clause of the Constitution," William A. Anderson, attorney-general of Virginia; "The Increased Control of State Activities by the Federal Authorities, Especially by the Federal Courts," Charles A. Moore, Asheville, N. C.; "The Increased Control of State Activities by the Federal Courts," R. B. Scott, University of Wisconsin; "Aerial Navigation in its Relation to International Law," Arthur K. Kuhn, New York City; "The Law of Nature in Early American Diplomacy," Jesse S. Reeves, Dartmouth. The sessions of the American Historical Association, the Bibliographical Society of America, and the Mississippi Valley Historical Association will be held at the same times and places.

The plans for a suitable recognition, under the auspices of the Cambridge Historical Society, of the one-hundredth anniversary of the birth of Oliver Wendell Holmes are rapidly taking shape. The society will devote to this purpose its regular spring meeting, Tuesday evening, April 27, 1909. The meeting, to be held in Sanders Theatre, Cambridge, will be open to the public. President Eliot will preside. Brief addresses will also be made by Dr. Edward Waldo Emerson of Concord, son of the philosopher, who was associated with Holmes in the famous Saturday Club; by Dr. David Williams Cheever, professor of surgery, emeritus, in the Harvard Medical School, who was the assistant of Dr. Holmes when the latter was professor in the Medical School; by the Rev. Dr. Samuel M. Crothers of Cambridge; and by Col. Thomas Wentworth Higginson, who was the personal friend of the poet. This recognition of the poet's centenary very properly will take place in Cambridge, where Holmes was born and reared, and where his father, Dr. Abiel Holmes, was pastor of the First Church for nearly forty years.

The Nobel peace prize has been awarded to K. F. Arnoldson of Sweden and M. F. Bajer of Denmark. The other awards are as follows: Literature, Prof. Rudolf Eucken of Jena University; physics, Prof. Gabriel Lippmann of the University of Paris; chemistry, Prof. Ernest Rutherford, director of the physical laboratory of the University of Manchester, England; medicine, divided between Dr. Paul Ehrlich of Berlin and Prof. Elie Metchnikoff of the Pasteur Institute, Paris. Mr. Arnoldson and Mr. Bajer are ex-parliamentarians. Professor Eucken, now sixty-two years old, studied philology, history, and philosophy at Göttingen. He was professor of philosophy at Basle from 1871 to 1874, and has since held the same chair at Jena. He is the author of numerous works on religion and philosophy. Last year he published a work on the "Higher Problems of the Religion and Philosophy of the Present Day," which is supposed to be the basis of the award for "the most remarkable literary work of an idealistic nature." Professor Lippmann is commander of the Legion of Honor, member of the French Academy of Sciences and the Bureau of Longitudes. He is a native of Luxemburg, but his parents were French. He is an expert in acoustics and optics, electricity, and thermodynamics, has made sensational discoveries in color photography, and has written extensively on all these subjects. Professor Rutherford was born in New Zealand, in 1871; was educated at the New Zealand University and Cambridge; and was professor of physics at McGill University, Montreal, from 1898 until he went to his present post in 1907. He has devoted much attention to radio-activity and the ionization of gases by Röntgen and Becquerel rays, and has published many papers on these topics. Dr. Paul Ehrlich was born in 1854 in Schleswig and studied in Breslau, Strassburg, Freiburg, and Leipzig. He has contributed to various departments of medical knowledge, including the nature and treatment of tuberculosis, diphtheria, anæmia, and cancer. He holds many medical honors and offices in Germany, and is an Imperial Privy Councillor. Dr. Metchnikoff has been a professor at the Pasteur Institute for several years. He is a member of the Paris Academy of Medicine and of the Royal Society of London. His publications include "The Nature of Man" and "Immunity in Infective Diseases." Recently he has attracted popular attention by advocating kumiss as an aid to longevity.

Dr. Cyrus Northrop, who has been president of the University of Minnesota since 1884, will resign at the end of the present college year. He was born at Ridgefield, Conn., in 1834, and was graduated from Yale in 1857. From 1863 to 1884 he was professor of rhetoric and English literature at Yale.

Herman Knickerbocker Vielé, a clever and popular novelist, died in this city December 14. He was born here in 1856, studied engineering, and for a time practised that profession. His bent, however, was rather toward painting and literature. His pictures were clever and have appeared in a number of exhibitions, but he was more successful in literature. His novels are: "The Inn of the Silver Moon" (1900), "The Last of the Knickerbockers" (1901), "Myra of the Pines" (1902), and "Heartbreak Hill" (1908) (see the *Nation* of October 1, p. 318). He wrote one volume of verse, "Random Verse" (1903), and one play, "The House of Silence" (1906).

The death of Donald Grant Mitchell ("Ik Marvel") on December 15, at the age of eighty-six, is reported from New Haven, Conn., as we go to press. We must reserve till next week discussion of his life and work.

FERRERO'S ROME.

The Greatness and Decline of Rome. By Guglielmo Ferrero; translated by H. J. Chaytor. Vol. III: The Fall of an Aristocracy. Vol. IV: Rome and Egypt. Pp. 342, 291. New York: G. P. Putnam's Sons. $2.50 net each.

The third and fourth volume of Signor Ferrero's notable history, which make their appearance in English dress just as its author begins his American lectures, are devoted to the years which intervened between the death of Cæsar and the departure of Augustus for the East, B. C. 21. The work grows in detail as it advances, the length of time comprised within the third volume being but half of that covered in the second, and while there is no loss of interest, we confess to disappointment that a writer whose merit lies on the side of insight and literary skill, rather than of profound investigation, should be drawn more and more into the minutiæ of his subject. It is true that our sources of information for the earlier part of this period are unusually full, thanks especially to Cicero's correspondence, but the extent of our knowledge of events is no criterion of their historical importance, and even Ferrero's theory of the significance of infinitesimal social forces cannot give value to these years of low intrigue and political vacillation. No great principle is at stake, no great problem is being worked out. Cæsar is gone, and his successor has not yet come—that is the substance of it all.

As in the earlier volumes, the chronological order is closely followed, but the result is far different from the bare and colorless annals of the official history of the early Romans, which Ferrero, in contrast to the "artistic and psychological" method of Sallust which he himself professes, styles "as dry and absurd a mode of narration as the critical and scientific historical methods which certain pedants would revive today." Social and economic conditions are strongly emphasized, although with a certain lack of continuity due to the strictly chronological arrangement. To Ferrero it was a sordid age, caring little for Cæsar, but much for Cæsar's money, and for the wealth that had been acquired through his acts. "If the republic is lost, at any rate save our property," wrote Atticus to Cicero, with a selfishness which "implied the risk of losing not only the republic, but also the property." There was no social stability or moral strength, and the proscriptions only laid bare the cruelty and cowardice of a generation "far weaker than the men of Cæsar's day in its fear of death and poverty." The civil war hastened the economic decline, one symptom of which was the throng of vagabond philosophers who preached an asceticism which "has invariably been

a flourishing philosophy in times of want." There was, however, a good side to this ostentatious poverty, for men were forced to husband their resources and the movement back to the land was stimulated. The revival of Italian agriculture was "the great achievement of the hundred and fifty years which had elapsed since the death of the Gracchi." The Georgics and Varro's great treatise on scientific husbandry were both begun in 37 B. C., the year with which the third volume closes, and its final pages leave us in the serene atmosphere of Virgil's "immortal hymn to the plough, an implement which, quite as much as the sword, enabled the Romans to conquer Italy."

Such efforts to correlate literature with the facts of external history are useful, even if sometimes forced. Each of the Eclogues is brought into connection with the events of the time, the glorification of Octavian's agrarian legislation in the first of them being characterized as the earliest attempt to "make bucolic poetry a medium for the treatment of what we should now call a question of the hour." Cicero's "De Officiis," though mediocre as a philosophical treatise, is recommended to the close attention of historians as a most important document, because of its theory of the possibility of a social and moral regeneration for Rome. The introduction of Horace to Mæcenas is duly chronicled among the events of the year 39; the Thirteenth Epode is localized in the camp before Philippi; and the satire describing the journey to Brundisium, which Gibbon tells us he read with geography rather than poetry for his object, is used to furnish evidence of the deserted condition of the country and the decline of the aristocracy. The Odes reflect the manifold aspects of "the general antagonism in which Italy was involved at the close of the civil war, and in which she was to struggle for a whole century, the antagonism between the Latin principle and the Greek Oriental principle of social life, between the state considered as an instrument of rule and as an instrument of refined civilization, between Roman militarism and Asiatic culture." These contradictory aspirations, whose varying phases Horace expresses without attempting to reconcile, the Æneid unites "in a magnificent but imperfect whole" which is "the voice not merely of a poet but of an epoch."

The period covered in these volumes offers less opportunity for those appreciations of persons which give so much flavor to their predecessors, but the characterizations are not lacking in point or vigor. Of the triumvirs, Antony was, with all his defects, "the one remarkable personality." "A man of powerful frame and active mind, daring and generous, but sensual, imprudent, proud, and violent," he had entered political life as "a career of glorious piracy" and pursued it wildly with varying fortunes until the position in which he was placed by Cæsar's murder compelled him to exercise prudence and reflection. In the days of doubt which followed he tried to steer a middle course between the popular party and the conservatives, and even at Cæsar's funeral, instead of delivering the inflammatory speech with which he is generally credited, Ferrero holds, following Suetonius, that he only added a few perfunctory words (*per-pauca*) to the reading of the Senatorial decree. His acts of decision were due to the influence of his brother Lucius and his wife Fulvia, a woman who had become by character and training "the stormy petrel of revolution," and had married Antony "as if it had been her destiny to become the wife of every leading agitator in Rome in turn." As the author observes:

> It has constantly happened that great historical figures like Antony have been overcome by hesitation when about to stake their fortunes upon one supreme cast, and that they have decided to act, merely under the persuasion of lesser known and less intelligent characters, whose obscurity and ignorance had enabled them to preserve greater coolness and courage at a critical moment.

In Antony's later years the dominating influence was, of course, Cleopatra; but to Ferrero their relations constitute an episode in world-politics rather than a romantic love-story, their marriage being dictated not by passion, but by considerations of political advantage. Antony, who had endured with equanimity three years of separation from Cleopatra, needed the treasure of Egypt for his Eastern campaigns, while Cleopatra hoped to save Egypt from subjection to Rome and make it the centre of a new empire. The struggle with Octavian thus became, not a struggle for monarchical power at Rome, but the last desperate effort of the only Mediterranean state which still retained its independence. The fundamental reason for Antony's defeat was neither the valor of his adversary nor his own defective strategy, but "the hopeless inconsistency of his double-faced policy, which, while professing to be republican and Roman, was actually Egyptian and monarchical." Ferrero is not the first to emphasize the Eastern aspects of this contest, and his narrative follows in the main that of Bouché-Leclercq, but he goes further than his predecessors at many points, and makes a number of interesting suggestions, especially in his interpretation of the acts of Cleopatra, whom he credits with a high degree of intelligence. He is likely, however, to be ingenious rather than convincing, and he seems to us to leave unsolved the great enigma of the flight at Actium.

Cicero's personality and place in history are summed up in the following striking passage, illuminating, in spite of its exaggerations:

> Cicero was the first of those men of letters who have been throughout the history of our civilization either the pillars of state or the workers of revolution; the great company of rhetoricians, lawyers, and publicists under the pagan empire are succeeded by the apologists and fathers of the church; monks, lawyers, theologians, doctors, and readers appear in the Middle Ages; humanists at the time of the Renaissance; encyclopædists appear in the eighteenth century in France; barristers, journalists, political writers, and professors in our own day. Cicero may have made many a grave political error, but none the less his historical importance can compare with that of Cæsar, and is but little inferior to that of St. Paul or St. Augustine. He had, moreover, all the fine qualities of the dynasty which he founded, and of their defects only the most venial. He was one of those unusual characters, rarely to be found even in the world of thought and letters, who have no ambition for power, no thirst for wealth, but merely the far nobler desire, whatever the vanity which it implies, to become the objects of admiration. Of all the men who governed the Roman world in that day, Cicero, alone amid the frightful political debasement of his time, had not wholly lost that sense of good and evil which may not raise a man above petty weaknesses, but at any rate withholds him from criminal excesses and extravagance. He alone attempted to govern the world, not with the foolish obstinacy of Cato, or with the cynical opportunism of others, but upon a rational system based upon loyalty to republican tradition amid the prevailing disorder, based upon the effort to harmonize the austere virtues of the Latin race with the art and wisdom of the Greeks and to disseminate throughout the Roman aristocracy that sense of equity and moderation which can often mollify the constitutional brutality or blindness of the principle that might is right. Historians have jested lightly upon Cicero and his Utopias; his contemporaries must have thought more of them, seeing that fifteen years later they attempted to put many of them into practice.

This attempt to carry out Cicero's ideas was, according to Ferrero, made by no less a person than Octavian himself, who "spent forty-one years in uninterrupted effort to realize the programme of political and social regeneration developed by Cicero in the 'De Officiis.'" A man of letters rather than of action, possessing "not so much overwhelming energy as cold intellectual power," Octavian resembled Cicero rather than Cæsar, whose real political heir was Antony; and the government which Octavian set up was neither a dyarchy nor yet a monarchy hidden beneath republican forms, but an honest effort to restore the republic under a constitutional ruler with powers "resembling those of the Federal President of America." It is to Ferrero inconceivable that the republicanism of Rome, which has done so much to stimulate democracy in modern times, was dead

after the battle of Actium, and, the time not being ripe for a monarchy, he accepts at their face value Octavian's professions of his desire to reëstablish the republic. Nowhere else does the author more boldly challenge current views of Roman history, but to challenge is not to disprove, and, if these views are to be established, it must be by a more patient examination of evidence than he seems willing to make. It must be said, however, that he tries to look at the problem from the point of view of the age itself, and it is only fair to reserve our judgment until the whole history of the reign of Augustus has been placed before us. One quality Ferrero has still to show before he can do full justice to the constitutional work of Augustus, namely, a certain legal sense. The Romans were a lawyerly people, careful to square themselves, as far as possible, with formal legality, and a large part of their history is intelligible only when this fact is borne in mind. We are inclined to agree with Ferrero that Mommsen has often carried the lawyer's method too far, especially by "importing legal ideas of excessive rigidity into the study of revolutionary epochs"; but the epoch to which we have now come is not revolutionary, and the establishment of the principate is in large measure a problem in constitutional law which demands a legal mind for its full comprehension.

CURRENT FICTION.

The Virgin in Judgment. By Eden Phillpotts. New York: Moffat, Yard & Co.

After Mr. Phillpotts's recent sally in sensational romance, it is reassuring to find him returned safely to his solid ground of Dartmoor and its peasantry. This is a fit companion for "The Whirlwind": there was a study of Ceres, of benignly yielding and maternal womanhood; and here is a complementary study of Artemis. This story has, to be sure, its own potential Demeter, tragically undone—not in the conventional way—by her own innocence and insatiable generosity, as the virgin Rhoda is undone by her fierce instinctive distrust of men and women in any generous relation. The mature and beautiful woman, with her hard eye and cold disdain of males and mothers, her fondness for puppies and indifference to children, is a monster in the sight of her fellow-rustics, and, one feels, despite his honest efforts as her apologist, in that of her creator. Indeed, if it were not for the paradox of her robust beauty and the alleviating fact of her devotion to her brother, she might be dismissed as the mere mischief-making prude. That is the part she plays, and it hardly seems that the eventual alienation from the single object of her regard is too great a punishment. Nevertheless, it is this stern she and her equally stern brother who are the tragic figures. The lover whom she scorns and wrongs is of too volatile and eager a nature to be more than dashed by his misadventure; and the gentle wife, who is yet more cruelly wronged by her, dies fitly the death of an Ophelia—a creature pathetically inadequate to cope with this harsh world.

These are, after all, merely the most dramatically salient figures to be encountered upon Mr. Phillpotts's "Ringmoor Down." The principal charm of this book will lie for many readers in its picture of the rustic community as a whole, the place and the people as they exist day by day, without regard to the exigencies of any novelist, even of Mr. Phillpotts. The writer's chief distinction lies, perhaps, in his well-nigh Shakespearean respect and liking for simple and dull people. There is nothing of the satirical rogue in his treatment of them, no sharpness or condescension or desire to use them as copy. The group of worthies about Mr. Shillabeer's bar obviously do not discourse for somebody taking notes. Their arguments have the delicious inconsequence of every-day life. And from the midst of their humdrum, flashes of true philosophy and poety—an essence wrung from hard experience—emerge. Thus that ex-prizefighter and publican, "Dumpling" Shillabeer, on his dead wife:

> And she took such delight in everyday things, owing to being town-bred, that when I look at a sow with young, or a pony and foal, or the reds in the sky at evening, or a fall of snow, they all put me in mind of her. For whether it was a budding tree, or a fish in a pool, or one of they bumbling bees in a bit of clover, everything made that woman happier.

The story's teller's descriptions of the moor country have their usual imaginative power. It were idle to quote snatches of them here, though more than one passage is a temptation. They contribute largely to that sense of a true atmosphere—a very different matter from "local color"—which is felt in all Mr. Phillpotts's most characteristic work.

Corrie Who? By Maximilian Foster. Boston: Small, Maynard & Co.

When the reader has once finished the first chapter of Mr. Foster's book and has discovered that it is *not* a novel of society, he will settle down to 460 additional pages of as charming a piece of light fiction as he is likely to come across in many a day. Corrie is a young girl who lives as companion to a wonderful Mrs. Pinchin and seeks painfully to find out Corrie Who and Corrie What she is. It is a story of mystery, handled very skilfully. Those desirable elements in a tale of this kind—suspense and suspicion—are to be had in abounding measure. But the volume possesses, in addition, exceptional charm of style and one delightfully elaborate character, the amazing Mrs. Pinchin to whom we have referred, the villain of the story. She is an elephantine and volcanic woman, with a limp and a cane having a fearfully prehensile hook at one end. She stuffs, guzzles, grunts at table, and dominates nearly every one in the book by sheer force of will and mind. Mrs. Pinchin and one of her enemies, Mr. Biggamore, have, to a high degree, the flavor of Dickens. Their presence in a story of mystery gives Mr. Foster's novel a strong family resemblance to "Edwin Drood."

Vronina. By Owen Rhoscomyl. New York: Dodd, Mead & Co.

The people of Southwestern England and Wales—King Arthur's Land—surely have no equal for passionate love of country, if we may judge from what their novelists feel. When it comes to a story of Devon, Cornwall, or the counties north of Bristol Channel, crag, moor, and sea are not the mere setting for human action; they enter into the tale as veritable protagonists, always conditioning the movements of the small human actors, dominating them, and often crushing them. It requires skill to handle such vast scenic props without plunging into sheer nature worship or, what is worse, boring the reader. In that respect the author of "Vronina" has been successful, though not by a wide margin. His Welsh hero and heroine are as strong and as mystic as his Welsh hills and moors. The novel suffers from starting out at too high an emotional pitch, and the style is very rhetorical. Mr. Rhoscomyl has, however, written with great sincerity about people who are impossibly good, bad, beautiful, strong, and primitive. There is an excellent tavern brawl in the early part of the book, an effective description of a night of storm in the mountains, and, as a companion picture, an all-night revival meeting.

The Tent Dwellers. By Albert Bigelow Paine. New York: The Outing Publishing Co.

This is that rarest of things, a book of out-door life written simply, swiftly, and honestly. It is the story of a three weeks' fishing trip in Nova Scotia, and Mr. Paine is to be congratulated on having got away from the time-honored formula for all books of this kind; namely, that there shall be immense preparations for the joys of open-air life, followed by the sad realities of wet feet, a cold in the head, washing dishes, and catching very little fish; that there shall be an unlucky and addleheaded member of the party whose adventures keep all his companions in good humor; and that little by little there shall steal into the heart of the disgruntled city-dwellers the knowledge

and love of the silence and mystery of the woods, the feeling of kinship with nature, etc. It is true that now and then Mr. Paine is tempted to speak of his companion Eddie in a manner that reminds us of Harris in "Three Men in a Boat." But the lapses are rare and are readily forgiven in view of the absence of startling adventure, miraculous feats of woodcraft, and excessive zoölogizing, botanizing, or philosophizing. To have made so fascinating an account of some weeks of quiet fishing, canoeing, and camping in the rain, is an achievement. To come sane out of the woods and have your publishers inflict on you as hideous a book-cover as Mr. Paine's publishers have bestowed upon him, is, we suppose, only one of the tragedies of civilization.

A Venture in 1777. By S. Weir Mitchell. Philadelphia: George W. Jacobs & Co.

A spirited little story for boys, old and young, with a glimpse of Washington and Valley Forge. There is over it all the touch of the expert in the handling of matters literary and military, so that nothing of exaggeration mars the tale. To read it should be a Christmas pleasure for patriots, mischievous boys, and lovers of both. Further, it should benefit a "most Christian labor," the Church Home for Children near Philadelphia. To it Dr. Mitchell dedicates the proceeds of his "Venture," in a preface speaking his admiration and sympathy.

The United States as a World Power. By Archibald Cary Coolidge. New York: The Macmillan Co. $2 net.

Professor Coolidge's book has interest from two points of view. As an historical sketch, it passes in rapid review those episodes in American history which have brought the United States particularly into contact with other Powers. Thus, we have chapters on the Monroe Doctrine, the Spanish war and its resulting colonialism, the Isthmian Canal, the relations of the United States with France, Germany, Russia, England, Canada, and Latin America, and the contact with Asia on the Pacific. While the narrative disclaims pretence of originality, it shows throughout a good acquaintance with authorities, especially those of a diplomatic character; and as a piece of summarization is extremely well done. Professor Coolidge neither skims nor distorts his subject: there are no merely superficial generalizations, on the one hand, nor, on the other, any effort to make the whole of American history turn about its international relations.

This much, however, was doubtless to be expected. The other aspect of Professor Coolidge's work, and the one in anticipation of which many will doubtless be chiefly impelled to read the book, has to do with its estimate of the general position and influence of the United States as a world power. "World power" with us is, of course, a compound of idealism and business. That a genuine and widespread belief in and love of liberty, a sincere desire to give spread and vogue to it, a sensitive humanitarian interest in the welfare of the race, a hatred of oppression and injustice, and a willingness to venture something on a generous impulse, have been influences of great potency in determining our attitude towards the rest of the world, is as much beyond cavil as is the fact that the demands of a cosmopolitan and rapidly growing population, the imperative need of markets for our manufactures, and our genius for business organization, force the United States to the front of the world-struggle for supremacy and place. It is one of the great merits of Professor Coolidge's book that he appreciates the significance of both of these influences, and not only gives to each its due weight, but also shows, more clearly than any other recent writer in this field, their combined effect in the development of a national temper and a national policy.

To say of an historical work that its treatment is sympathetic is often taken to imply that its point of view is, after all, a bit provincial or apologetic; but nothing could be farther from the truth than to draw such an inference in this case. If there be one characteristic, next to sufficient learning, which Professor Coolidge displays, it is that of generous cosmopolitanism. Singularly well-versed in the political history of Eastern Europe and of Asia, he is able to draw his illustrations from a wide range, and to view the progress of world power from the standpoint of the peoples upon whom the rigors of empire and "influence" most heavily fall. Yet he is not wholly unaffected by associates and associations. We cannot imagine, for example, that certain of his pages will meet with approval in German inner circles; or that all Englishmen will relish his frank declaration that the United States would have done well to get Canada in 1783; or that Japanese statesmen would fail to detect a slight tenderness in the treatment of Russia. On the other hand, the author does not conceal his convictions. He does not spare either England or France, or estimate Latin-American agitators above their deserts. Being an historian, he does not prophesy overmuch. He sees, indeed, no immediate likelihood of dispensing with the Philippines, and some prospect that we may have to take Cuba; but the Isthmian Canal can hardly fail to help somewhat in the solution of both these problems on their international side. As for the war cloud in the East, that has admittedly a dark fringe; but the economic forces which are operating to dispel it are at least as strong, for the moment, as the political forces which would aid its growth. For the problem of alien races, whether in this country or elsewhere, there is, apparently, no solution save that of getting along as well as we can with the peoples that are not Anglo-Saxon.

In short, our world mission, as Professor Coolidge conceives it, is that of peaceful, though inevitable, conquest—the victory of ideas and of economic forces rather than of arms. That Americans have thought well of themselves and their motives is not, in his judgment, a greater sin because the opinion has been, in preponderant measure, well founded; nor are their achievements in diplomacy, or, for that matter, in domestic government, the less imposing because so often due to good luck. That we are visibly awaking, albeit with irritating slowness, to the responsibilities of world power, that we are feeling increasingly the need of training and efficiency in public service, and that we still give genuine response to moral appeal, constitute for him the sure ground of confidence that beneficence, not disaster, may continue to attend the career of the United States as a world power.

In a field which, like this of world politics, changes daily before our eyes, no writer can hope to make a definitive contribution; and it can be no disparagement of Professor Coolidge to say that his book will be superseded. For the time being, however, and within its sphere, it is justly entitled to recognition as a work of real distinction. It has substance as well as symmetry and form; it is void of dogmatism or special pleading, but it moves the reader to thought; it handles serious and complicated questions with a light touch, but the impression of its solid qualities is the impression that remains.

Egypt and Its Monuments. By Robert Hichens; illustrated with reproductions of paintings by Jules Guerin and with photographs. New York: The Century Co. $6 net.

The value of the impressions of a popular writer of fiction among the monuments of the Nile is not to be measured with the yard-stick of the archæologist or the historian. The question may be fairly raised, however, as to the value of such casual impressions when they become almost purely subjective—merely a series of meditations, which, while disclosing the inner life of a writer of insight and rather graceful and delicate fancy, are nevertheless far from such a revelation of genius as would give them significance for their own sake. In this book the monuments rarely speak; we constantly listen to Mr. Hichens, to the inevitable "I": "One

day I sat in the temple," "I sat quite still in the sun," "I looked about me," "I sat very still," "I . . . sat down on a warm block of stone." Those who find the personality of Mr. Hichens of greater interest than the monuments, those who are satisfied to float away into a cloudland which might as well hang above one temple as another, or equally well above Sicily or Greece, should by all means read this volume. But the reader must not demand even the vaguest knowledge of the great past. Matter-of-fact persons may, however, venture to ask: What should you say of a walk in Florence with one who knew no distinction between the men who preceded and those who followed Raphael, but mingled them all in one confused rhapsody? To Mr. Hichens's uninformed, undiscriminating mood the cumbrous, vulgar, and debased colonnades of the decadence are as suggestive as the soaring lines of Amenhotep III's splendid court at Luxor, the noblest colonnades on the Nile. Indeed, it is the architecture of the decadent twentieth dynasty that appeals to Mr. Hichens as most striking in "nobility" and "simplicity"; to him it is "extraordinarily classical" and "wonderfully elegant."

Could not the actual objective facts presented by the monuments of Egypt be made the food for meditations full of literary charm, warm with the human and picturesque appeal of the East, and pervaded with that subtle mystery of age with which the greatest ruins of the Nile are instinct? Cannot the Great Pyramid speak to us as the earliest and most impressive surviving witness to the emergence of organized man from prehistoric chaos? Instead of a line —a single line on the terraced pyramid of Sakkara—could not that structure be interpreted as a transition form, pointing us unequivocally back into the dim ages behind the Great Pyramid to the germ out of which the pyramid form grew? Should Karnak tell us no story of the seventeen hundred years (2000-300 B. C.) during which it was building, no hint of the long tangle of harem intrigues and court tragedies which have been wrought into its walls, where one may still discern grim traces of the rise and fall of Egypt's greatest princes, as court coteries and priestly partisans elevated or overthrew them? Some vague suggestion of all this seems to have haunted Mr. Hichens at Karnak, for he says:

> Thothmes III, Thothmes I, Shishak, who smote the kneeling prisoners and vanquished Jeroboam, Medamut, and Mut, Amenhotep I, and Amenhotep II—all have left their records or been celebrated at Karnak. Purposely I mingled them in my mind—did not attempt to put them in their proper order, or even to disentangle gods and goddesses from conquerors and kings (p. 80).

It is much to be doubted whether any of his readers can disentangle Mr. Hichens here; for just at this point his eye fell on the wrong place in the guide-book, and "Medamut," the name of a *modern Arab village* behind Karnak, slipped in among the gods and Pharaohs celebrated in the great temple! In fine, allusions plucked at random from an ancient guide-book cannot reproduce the subtle atmosphere of the East, nor can a few catch-words of Islam, strewn among lurid epithets intended to paint the dying day and the hushed hour of prayer at sunset, imbue the reader with the elusive spirit of the Moslem world, as do the less pretentious sentences of simpler men, who were steeped in the life and lore of the Orient, men like Lane, Doughty, and Burton. The lazy life of the dahabiyeh voyage is well portrayed by the author; but as for the rest, it is current magazine pabulum, extremely attenuated.

The text is reinforced by Jules Guerin's paintings, twenty in number, reproduced by the three-color process. These works are highly sensational, extremely stylized, Parisian posters. They are all striking, and often original. A few are very effective; but they, too, are for the most part as subjective and imaginative as the author's text. Guerin does not possess the power of line and splendid sense of form displayed in the etchings of the Nile monuments by Ulbrich. He has failed utterly, for example, to catch the majestic symmetry of Luxor, the greatest architecture on the Nile. His rendering of Abu Simbel is grotesquely impossible and suggests little of the sombre majesty of the place. He is, however, deeply imbued with the impressiveness of hoary age, and is not infrequently successful in conveying it. As to color, no one ever saw such tones along the Nile as these pictures offer. Especially is this true of the blazing red costumes, which are wholly imaginary, like the army which Guerin marches before the Sphinx. That the work is thus emphasized and arbitrarily "touched up," is decisively shown by the moon, inserted in a position impossible in Egypt. Forty excellent half-tones, chiefly from stereographs by Underwood & Underwood, also embellish the volume. The publishers have given it sumptuous and, with the exception of the outside cover design, very pleasing form—a form worthy of a better work.

Charles Dickens. By Frederic G. Kitton. New York: D. Appleton & Co. $3.50 net.

Mr. Kitton has busied himself for many years with the subject of this volume, and the Dickens market is now undeniably strong. It is, therefore, painful to say that his 504-page addition to the Dickens literature does not really justify its existence. It has no critical value of its own, and it owes little or nothing to the craftsmanship of Gissing, to the scholarship of Mr. Ward, to the originality of Mr. Chesterton, or to the critical studies of any other Dickensians. It must be judged purely as a contribution to biography. Thirty-five years ago, John Forster, Dickens's life-long and most intimate friend, literary adviser and executor, wrote a life of the novelist which Carlyle, who knew something of such matters, ranked among biographies with Boswell's "Johnson." Since that time, many others have contributed biographical sketches useful for their brevity or interesting for their amplification of portions of the authoritative life; but no one till Mr. Kitton has attempted to supersede Forster. Mr. Kitton, however—if we take his preface at its face value—believes that the "wealth of fresh matter" inaccessible to Forster warranted the rewriting of the entire life. He emphasizes particularly the "immense field for research" in the "printed letters of Charles Dickens (the majority of which were unknown to Forster)," and congratulates himself on his ability to supply from them "those autobiographical touches so useful to the historian." That is a curious point. Now as a matter of fact, Forster drew copiously from his own incomparable collection of letters for these same autobiographical touches, and, though he had access to many others, used them sparingly, because his own were much more intimate and illuminating; "to have added all such others as were open to me," he says, "would have doubled the size of my book, not contributed to it a new fact of life or character." Yet one who reads this new life without reference to Forster may well be convinced that Mr. Kitton has turned up a great mass of new material of all sorts. Unfortunately, however, a comparative examination of the two biographies shows that practically everything of value in Mr. Kitton's has been conveyed out of Forster's and the fact slurred over by inadequate acknowledgment of indebtedness.

This method of writing biography may be roughly illustrated as follows: (1) Forster compares the memory of Dickens with that of Scott, and observes that David Copperfield thought he could remember his first attempts at walking. This, said David, may be only a fancy. Mr. Kitton also compares the memory of Dickens with that of Scott, and says that Dickens could remember his first attempts at walking—without citing authority or making any acknowledgment to Forster. (2) Mr. Kitton frequently quotes Dickens without giving any reference; in a large number of cases these quotations are from letters to Forster, included in Forster's life. (3) Mr. Kitton quotes very freely from the letters and conversation of Dickens's friends—"Carlyle said," or "Jeffrey said," etc.

—without indicating his source; in almost all such cases, the source is Forster. A striking case of this disingenuousness occurs in connection with the account of Dickens's early life; no one would suspect that the "old schoolfellows," whose testimony is so interesting, had not communicated it directly to Mr Kitton, instead of sending it to Forster, who incorporated it in his book. (4) In order to bear out the preface, Mr. Kitton frequently refers the reader in footnotes to "The Letters of Charles Dickens"; in very many instances, the passages which he cites are in Forster. (5) One of the most absurd attempts to give the impression of fresh material is a reference to "Charles Dickens as I Knew Him," by George Dolby, as authority for certain words of Forster, dissuading Dickens from going to America; it is difficult to understand why Mr. Kitton did not quote Forster's precise words as given by Forster. The fact of the matter is that if Mr. Kitton had acknowledged in every case his indebtedness to Forster, the superfluousness of his book would have been obvious to everybody. It is in its total effect an abridgment of the work of his predecessor: What it suppresses—the intimate comment and criticism of Dickens's bosom friend—is of the highest interest and value; what it adds—a few scraps of information and letters—does not contribute any new and important "fact of life or character."

Science.

VACCINATION AGAINST TYPHOID.

The decision of the army medical board, which met in Washington last week, to adopt for the army vaccination again typhoid fever, is not a radical venture into an unexplored field. On the contrary, it is another case where the extreme conservatism of our military men has resulted in our falling far behind other and more progressive services. Not until this year is there found in any publication of the Surgeon-General a reference to immunizing against typhoid, and this despite our harrowing and largely unnecessary losses from this disease in our camps of 1898-99. In his recently published report, Surgeon-General O'Reilly speaks of foreign armies as now being much interested in "the difficulties in the way of controlling the factors concerned in the spread of the disease," and "endeavoring to render their soldiers immune to typhoid by means of anti-typhoid vaccination." He does not record that more than ten years ago British medical officers were at work upon this problem.

It was Sir Almroth Wright, then only Capt. Wright, of the British Medical Corps, who invented, about 1898, a typhoid vaccine full of promise. It was first tried in India, where it was optional with the soldier to take the treatment or not. Among those vaccinated, however, as medical observers soon noticed, the number of typhoid cases was precisely one-half of those among the unvaccinated, and the comparative death rate was even more strikingly lowered. The Royal College of Physicians of London reported favorably on the inoculations as far back as 1903, and, except for eighteen months, when, owing to a misunderstanding, the practice was forbidden, it has been in constant use ever since. Because enteric fever was their worst enemy in their costly campaign against the Herreros in Southwest Africa, the Germans naturally tried vaccination with valuable results. Inoculation with killed agar cultures reduced the death rate considerably. In 424 cases, of which 324 were not inoculated, and 100 were, there was a mortality of 11.9 per cent. among those not inoculated and of 7 per cent. among the others. It is not, however, generally believed that inoculation, as we know it now, is going to do much where the patients have been stricken with the disease. It is in prevention that the hope lies; and though Sir Almroth Wright's statistics have been severely criticised, both the French and Italian armies have met with considerable success in experimenting along his lines. It is hard to understand, therefore, why our Medical Corps is only to-day awakening to its opportunities.

The method of preparing and using the vaccine is relatively simple. Colonies of typhoid bacilli, from which all other germs have been carefully excluded, are grown in the laboratories. These highly virulent mixtures are then killed by heat, standardized as to strength, treated with a small quantity of antiseptic to preserve them, and are then set away until needed. Vaccination itself is by means of a hypodermic syringe, two doses being usually given, often separated by an interval of days. The first dose contains several hundred million dead typhoid bacilli, and the second about twice as many. As a rule, the vaccination is no more annoying to the patient than is the smallpox vaccine. There is a slight redness and swelling at the point of inoculation, and some fever, which, however, rapidly subsides. The second injection greatly increases the degree of protection, and there have been, we believe, as yet no such unfavorable developments as have sometimes followed in the wake of smallpox vaccination and have caused the organization of anti-vaccination societies throughout the world.

There is still considerable difference of opinion as to the length of time during which the protective effect of typhoid inoculation lasts. According to reports lately received from India, the best workers believe that the immunization lasts six years. As the statistics quoted above show, there is no guarantee of absolute immunity, but it is now generally agreed, as is stated by Dr. Edwin O. Jordan, professor of bacteriology in the University of Chicago, in his new "Text Book of General Bacteriology" (see the *Nation* of December 3, p. 556), that protective inoculation is desirable even in times of peace wherever attendants in hospitals have to deal with numbers of typhoid cases. It is hoped, too, that in serious epidemics among civilian communities, typhoid vaccination may come to be an important means of staying the spread of the disease. Had it been used extensively in Philadelphia, for instance, during the recent typhoid epidemics, due to bad drinking water, many lives might have been saved. At least one British missionary association has recommended that all of its members going to tropical regions where enteric fever is endemic, subject themselves to inoculation before their departure.

One of the most notable things about the action taken last week at Washington is the composition of the board itself. Only one member of it is in the regular medical service—Gen. O'Reilly; the others are Dr. V. C. Vaughan of the University of Michigan, Prof. W. T. Councilman of Harvard, Dr. Simon Flexner, director of the Rockefeller Institute, Prof. W. S. Thayer of the Johns Hopkins Medical School, Dr. John H. Musser of the University of Pennsylvania, and Dr. Alexander Lambert of this city, professor of clinical medicine in the Cornell Medical school. All of these distinguished men, and others besides, have recently affiliated themselves with the army as first lieutenants of the new Medical Reserve Corps. Under the law reorganizing the medical department of the army, physicians and surgeons thus appointed may be called into active service at any time there is need for them, either as members of boards or as professional adjuncts. If by frequent consultation with distinguished men of this character, the Medical Corps can be rendered more progressive, the army will benefit enormously, and so will science. While there are a number of valuable and progressive medical officers in the army, the extreme conservatism of the heads of the department has too often kept them in the background and has driven men like the late Major Walter Reed and Col. W. C. Gorgas to find fame and reward in what is not really military medical work. Perhaps the new Surgeon-General, Col. George H. Torney, who takes office next month, will be able to inoculate his branch of the military service with a virus of radical progressiveness.

As usual, the annual report for 1907 of the Regents of the Smithsonian Institution

consists chiefly of reprints of the year's most important scientific memoirs. Charles A. Parsons's essay on "The Steam Turbine on Land and Sea," is a popular historical sketch, very different from Prof. A. Turpain's "Development of Mechanical Composition in Printing," which follows it. Professor Turpain's account of the electrotypograph, while technical, is a very clear, brief statement of the mechanism of this remarkable Hungarian invention. Frank J. Sprague's "Some Facts and Problems Bearing on Electric Trunk-Line Operation," is an abridgment of a paper presented before the American Institute of Electrical Engineers. An admirably simple report of the principles and operation of wireless telegraphy is given by Prof. J. A. Fleming. Two papers of interest to photographers are T. W. Smillie's "Recent Progress in Color Photography," and S. R. Cajal's "Structure of Lippmann Heliochromes," the latter an investigation of interference phenomena. The contributions on zoölogy and anthropology are the most extensive. They include a summary of Gustave Loisel's exhaustive study of English, Belgian, and Dutch Zoölogical Gardens; Theodore Gill's "Systematic Zoölogy: Its Progress and Purpose"; Prof. Theobald Fischer's sketch of "The Mediterranean Peoples"; Dr. E. Baelz's "Prehistoric Japan"; Henry Balfour's detailed examination of the types and geographical distribution of the fire piston; and other papers. The volume closes with Camille Matignon's intimate sketch of Marcelin Berthelot and Edward L. Greene's memorial address on Linnæus.

The "Infantilism" of C. A. Herter (The Macmillan Co.) is a highly specialized little treatise on a curious and hitherto unknown or imperfectly recognized disease of childhood in which growth is retarded and disturbances of digestion are conspicuous. It has been possible to show that this condition depends on the persistence of bacteria more or less characteristic of infancy and on the deficient development of other bacteria commonly found in older intestines. Dr. Herter's discussion of the question is interesting, and his proposals concerning a rational therapy are full of promise.

Dr. Woods Hutchinson's volume, "Instinct and Health" (Dodd, Mead & Co.), is made up of sixteen chapters on various topics related to the conduct of life. All of them have been seen in magazines or reviews of the last two or three years, and doubtless many of their readers will be glad to have them in a collected form; others may perhaps find the collection just a little cloying. The writer has a ready pen and without hesitation handles large problems in a light and easy fashion as though their solution were merely a playful exercise of intelligence. The central thought, set forth in the very first pages, but bobbing up at short intervals all through the book, seems to be that the human machine has been some twelve or thirteen million years in the making, is pretty well made, and having an extraordinary power of adjustment may be permitted in large measure to run itself. Dr. Hutchinson recognizes, however, that some guidance is necessary and gives considerable advice, often rather indefinite and vague, but on the whole sound. Unfortunately, there is a tendency to overlook what care has done for the machine and to disparage serious investigation of the conditions under which the machine works best. The teaching is largely by iteration and assertion with no marked fondness for careful argument or exact demonstration, and yet the book, while not aimed very high, ought to prove helpful to many, particularly among those to whom the literature of breakfast foods is precious, and who, in general, are keenly interested in diets.

Among the new works published by R. Oldenbourg, Berlin, two by Friedrich Ratzel command attention. One is a selection in two volumes of his minor writings, "Kleine Schriften," edited by Hans Helmolt; the other is a little book, "Uber Naturschilderung." Ratzel's contributions to ethnography and physical geography have been distinguished by an artistic handling of the material quite rare in works of science.

Oliver Wolcott Gibbs, chemist and physicist, Rumford professor emeritus at Harvard, died at Newport, R. I., December 9. He was born in this city February 21, 1822, the second son of George Gibbs, an eminent mineralogist. The boy was, besides, brought under the influence of quite another section of the intellectual world, by close family relationship with the Channings. He was graduated from Columbia College in 1841, and thereupon entered the laboratory of Dr. Robert Hare in Philadelphia. Subsequently, he enrolled himself as a student in the New York College of Physicians and Surgeons; but after receiving the degree of M.D. in 1845 he went to Berlin in order to devote himself to chemistry under the great analyst, Heinrich Rose, then at the acme of his fame. He simultaneously studied mineralogy under the guidance of Rammelsberg. Subsequently, he was led by the rising star of Liebig to Glessen, there to bend his attention to that organic chemistry which was just beginning to crystallize in urea and uric acid; and then, as Victor Regnault was engaged in those determinations which have never yet been superseded, the young student betook himself to Paris. In 1849 he was appointed professor of chemistry in the Free Academy, since entitled the College of the City of New York. He was already becoming distinguished in his profession; and when, in 1853, Dr. James Renwick retired from the chair of chemistry in Columbia, Gibbs was regarded as his natural successor. But to the Board of Trustees of that day, under the presidency of Charles King, the idea of appointing a Unitarian to teach chemistry in Columbia was quite too shocking to be entertained; and Dr. Gibbs continued his work in the Free Academy for another ten years. In 1863, on the resignation of Eben N. Horsford, who had been in charge of the chemical laboratory of the Lawrence Scientific School at Harvard, Dr. Gibbs succeeded to the position, and became Rumford professor. His success there is shown by the great attention the contributions from that laboratory everywhere attracted, and still more positively by the number of Gibbs's students who have since received distinguished scientific honors. He made important investigations in light and heat, but his greatest triumphs were in inorganic chemistry, where he opened up new realms, so to say, particularly in reference to complex inorganic bases and acids. His work on the platinum metals is also important. He was author of numerous articles and contributions to scientific journals, as well as to the *Nation;* and he was a member of many scientific societies, American and foreign. Gibbs was not only eminent as a scientist, but he was, besides, a man of great public spirit. During the war of the rebellion, he served upon the Executive Committee of the Sanitary Commission—nobody more actively. In order to aid and supplement that work, he thought it best that the earnest supporters of the war should be able to see one another daily in a club. To that end, he called a meeting in 1863, which resolved itself into the Union League Club.

From Berlin comes the report of the death, in his seventy-eighth year, of Hugo Hertzer, former professor of mathematics at the Technische Hochschule. He was the author of "Die geometrischen Grundprinzipien der Perspective" and "Fünfstellige Logarithmentafeln."

Charles Ballet, a well-known French horticulturist, and head of Ballet Frères at Troyes, has died at the age of seventy-nine. He wrote a number of books, notably "Les Bouves poires," besides contributing to French and English journals.

Drama.

Henrik Ibsen: The Man and His Plays. By Montrose J. Moses, New York: Mitchell Kennerly. $1.50 net.

This is a comprehensive summary of a considerable body of literature on Ibsen, which will be very useful to those junior students of the Norwegian dramatist who have neither time nor opportunity to consult the original authorities. It contains a sufficiently full sketch of his life; detailed, if not always clear, synopses of his plays; a variety of selected comment and interpretation, mostly of a highly laudatory description; and a liberal proportion of the author's individual views, which, though sometimes extravagant in their enthusiasm, often evince strong common sense and a power of discrimination never found in the fanatical worshipper. Like many other disciples of Ibsen, Mr. Moses is prone to exaggerate both the achievements and the influence of the master, but he does recognize some of his limitations. Thus he insists upon the imitative qualities of Ibsen's earlier plays and points out his persistent failure, especially in the days of his youthful iconoclasm, to realize that the world he satirized acted upon theories which might be worthy of consideration, even when they differed from his own. The frequent reappearance of identical motives and personages, under slightly changed conditions, in successive plays, Mr. Moses accepts as an indication that Ibsen's power of dramatic invention was restricted. He notes also that Italy never inspired him as it did Byron, Keats, or Shelley. It is, indeed, a curious fact that the first fruit of his southern travel was "Brand," than which nothing

could be more cruelly bleak and northern.

Only advanced Ibsenites will agree with Mr. Moses in his valuation of "A Doll's House" and the later social dramas, except with regard to their masterly construction. In this respect at least the Norwegian has equalled, if not surpassed, Scribe, Dumas (*fils*), and Sardou. Mr. Moses says that "a man who is always probing the inner crevices of conscience cannot deal with the golden crust." True, but the exploration of these filthy corners ought not to be conducted on the public stage. He calls Hedda Gabler "an aggregation of abnormal types," which practically is to admit that the piece is as futile as it is disagreeable. Elsewhere, he remarks that "Ibsen's feminine types are not normal . . . they do not exist, except when they serve the purpose of carrying Ibsen ideas." Nothing could be more accurate, but the admission is fatal to the playwright's pretensions as a realist. The truth is that he constantly assumes the part of a special pleader, inventing particular instances from which to draw general conclusions. No doubt he was zealous for truth and liberty, but he often mistook the nature of both. Mr. Moses is right in his final judgment that "The Pretenders," "Brand," and "Peer Gynt," having a larger humanity, will outlast "A Doll's House," and its successors.

The interest of this book suffers much from the author's crudities of style.

We have so often called attention to the peculiar excellence of Thomas Y. Crowell & Co.'s First Folio Edition of Shakespeare, that it is scarcely needful to do more than name the three new volumes containing "The Two Gentlemen of Verona," "The Taming of the Shrew," and "Coriolanus." For those who desire the text of the plays as it was printed in 1623, this is by far the best and handiest edition. We must specially commend again the device of printing the meaning of obsolete words in the side margin where the eye catches it without conscious direction. The editors, Charlotte Porter and Helen A. Clarke, continue to gather the same wealth of interesting material in the notes and appendices. The printing is by the De Vinne Press. Twenty volumes in all have now appeared, of the forty which are to complete the set.

The literature about Friedrich Hebbel and his position in the German drama is constantly increasing. The most voluminous of recent books in regard to him is a work of 551 pages by Achim von Winterfeld, "Friedrich Hebbel: Sein Leben und seine Werke" (Dresden: E. Pierson). There is also a new complete edition of his works, including the diaries, "Hebbels Werke und Tagebücher" (Deutsches Verlagshaus Bong & Co.). It numbers five volumes and contains a biography, an introduction, and notes by Dr. Theodor Poppe.

The Leipziger Gesellschaft der Wissenschaften has published further fragments of Menander's "Perikeiromene" found in Egypt by Dr. Zucker. There are portions of 121 verses on two pages of parchment, 73 of the verses being new and well preserved.

The London critics speak highly of Mrs. Patrick Campbell's performance of the heroine's part in "Deirdre," the one-act tragedy in verse, by W. B. Yeats, which she produced recently in the New Theatre.

Music.

Aspects of Modern Opera. By Lawrence Gilman. New York: John Lane Co. $1.25 net.

Mr. Gilman's latest volume is dedicated to Ernest Newman, whom he justly calls "a critic of breadth, wisdom, and independence," and some of whose views have evidently strongly influenced him. It would have been more appropriate, however, to dedicate the work to Oscar Hammerstein, who produced Debussy's "Pelléas et Mélisande" with such signal success in New York that this opera suddenly came into vogue in Europe, too, where it had been previously neglected, except in two or three cities. For "Pelléas et Mélisande" seems to be, in Mr. Gilman's opinion, the greatest, the most wonderful opera ever written, or, as he himself calls it, "a perfect music-drama," and the only one in existence! The book contains four chapters, entitled "The Wagnerian Aftermath," "A View of Puccini," "Strauss's 'Salome': Its Art and Its Morals," and "A Perfect Music Drama." In the first three sections many interesting observations are made regarding Wagner, Puccini, Strauss, and other composers, but before the reader reaches the middle of the book he will begin to suspect that the author is like a huge spider weaving a web around him and making him a helpless victim by the time the last chapter is reached. It is a clever example of eloquent special pleading: the endeavor of an enthusiast to show that what the Florentine originators of opera toward the close of the sixteenth century aimed at; what Gluck two centuries later formulated; what Wagner, in the second half of the nineteenth century, fondly imagined he had achieved—that all this was not actually accomplished until Debussy, at the dawn of the twentieth century, gave to the world his "epoch-making" opera.

Following the example of Mr. Newman, Mr. Gilman takes great pains to belittle Wagner's dramatic poems in comparison with his music, going so far as to make the questionable assertion that "the sincerest appreciators of his art" are beginning to admit that "as a dramatist he was insignificant and inferior." Mr. Gilman forgets that, while there are undoubtedly weak spots in these poems, they are nevertheless far superior to all other operatic librettos, including Maeterlinck's "Pelléas et Mélisande," and that therefore in these days of a return to meretricious forms of operatic art on the part of the public, a critic can make himself more useful by dwelling on the beauties of Wagner's poems than on their flaws. But Wagner is not the only genius sacrificed to this Moloch. Saint-Saëns, who is, with the exception of Bizet, the most original and entertaining composer France has produced, is stigmatized as "a brain without a personality," and the other modern Frenchmen are dismissed as contemptuously, excepting Debussy and—d'Indy, a third-rate imitator of Wagner. What the author says of contemporary Germans is, however (though he should have excepted Humperdinck), unfortunately true; they have "the invariable fault of emptiness, of poverty of idea, allied with an extreme elaboration in the matter of presentation." The chapter on Puccini is excellent, though we fancy the author would have placed "Madama Butterfly" even above "Tosca" had he had the opportunity of hearing Toscanini interpret it. He notes the influence of Debussy in the "Butterfly" score, and this certainly is the best compliment ever paid Debussy. In our opinion, the work of Debussy is a mere trick of whole-tone scales and augmented chords, easily imitated and caricatured. Indeed, Debussy himself has announced that his next opera will be written in an entirely different style from that of his "Pelléas." The fortunate world, however, will always possess that one "perfect music-drama," and every lover of sincere, racy writing may read Mr. Gilman's plea for it with genuine pleasure, without endorsing a single one of his opinions.

Among books of German songs for children may be noted "Kindersang, Heimatklang" (Mainz: Joseph Scholz), a book of simple tunes, within the compass of the child's voice and so arranged by Bernhard Scholz as to be sung either alone or with one or two other voices. Ernst Liebermann has furnished delightful illustrations for this book. Another volume of children's songs, published by the same firm, is called "Weihnachtsklänge."

At present there is a good deal of "politics" in musical affairs of New York city, not only at the opera houses, where rival factions are at war, but in the concert world. An attempt is being made by some wealthy women to raise a million-dollar fund which will place the Philharmonic on the same footing as the Boston Symphony Orchestra, and it is likely in any case that Gustav Mahler will succeed Wassily Safonoff next season as the conductor of this orchestra. He will give two tentative concerts with this organization next March. In the meantime a somewhat awkward situation was created by the engagement of Mahler many months ago to conduct three of the concerts of Walter Damrosch's New York Symphony Orchestra this season. If the Philharmonic project succeeds it will be difficult to maintain this other organization as a "permanent" orchestra. The players of the Symphony, therefore, have

had no reason to feel sympathetic toward Mr. Mahler. Nevertheless, he has managed to give three of the most stirring concerts ever heard here. Even the second was superb as to the performance, but the programme was not edifying, as it contained only one number, Mahler's own second symphony, a work that lasted an hour and twenty-four minutes, although the thematic material would have hardly sufficed for a brief symphony of the pattern of Mozart, whose motto was: "Short and good is better." As Mahler has written eight long symphonies, one views his probable election as Philharmonic leader with some apprehension on this score; from every other point of view, however, it will doubtless prove a boon.

"Le Crépuscule des dieux" at the Paris Opéra shows, perhaps, the limits of the success of Wagnerian music in France, and perhaps even in all Latin countries. It need not be said that the instrumentation is technically perfect; æsthetically, the movement often leaves something to be desired. In fact, there is no sign that directors, singers, or public gather any significant story from the mythology of the piece, which to every one, so far as interest goes, is solely and simply a "Death of Siegfried." The idea of a "Twilight of the Gods" is common, and was so indeed before Wagner composed; but there is nothing in common French thought or legend or literature to enable the hearers to grasp German myths, which moreover seem to them difficult and complicated. An unpublished anecdote gives one key to the difficulty of establishing an intelligent Wagnerian cult in Paris. When Wagner in person was striving to conquer Paris, the poet Baudelaire, who was in full sympathy with the new music, was invited to hear the composer play it at the piano. Wagner began in a blue dressing gown; after a time he changed to a yellow gown, and finally to a green one. When he had finished, Baudelaire expressed very sincere satisfaction, but added diffidently that he would like to ask a question. Did the change of color in the dressing gowns symbolize anything in the music? Wagner looked sharply to see if the Frenchman were making fun of him; but, when persuaded of his good faith, he gave the explanation with much laughter. Playing so warmed him up that he had a change of gowns from heavier to lighter ready to hand; the colors were mere accident.

Art.

THE NATIONAL ACADEMY.

A first glance at the winter exhibition of the National Academy of Design gives one distinct impression which is not dispelled by closer observation. The quality which, for lack of a better word, may be called exhibitionism, is more pronounced this year than ever before. Whether consciously or unconsciously, a large number of artists are adapting their work to produce the best effect under the peculiar circumstances of light and association at an exhibition, with less regard for the disposition of their pictures afterwards. And this adaptation tends in two directions. On the one hand, the landscape painter is evidently not thinking so much of the actual scene out of doors or trying to carry the observer into the magical refuge of nature, as he is contemplating a picture in a gilt frame amidst innumerable other pictures. He works up a rich and heavy scheme of colors to something that looks like mosaic or tapestry; it is decorative or bastard antique, designed for the crowded wall and not for solitude. F. B. Williams has two notable pictures of this sort, one a view of Lledr Valley, North Wales; the other, called The Cascade, a group of three women against a swirl of water and green. Both stand out richly from among their neighbors. October, by F. De Haven, is another example of the same school, as is The White-Tide, in which Paul Dougherty has used the tapestry style for the sea. The last-named is the more remarkable, from the fact that hitherto Mr. Dougherty has painted directly and naturally.

The other tendency of exhibitionism is equally conspicuous and far more reprehensible—indeed, it would be misleading to use the word reprehensible at all of the pictures named above. This is an exaggeration of brutal strength, designed, intentionally or not, to throw a picture at the eyes, so to speak, and kill its neighbors. Such, at least, is the effect of the noisy, coarse sea-scene by F. J. Waugh, called At the Base of the Cliff, whose tumultuous lines and vivid greens work havoc with the quiet landscapes about it. Not so noisy, but instinct with the same egotistic assertiveness, is Charles Rosen's Below the Dam, showing a stream flowing down between banks of snow and ice, a cold, realistic, masterful work, which no one, we suppose, could endure to regard long in a private chamber.

As a transition from this style to the more intimate glimpses of nature should be mentioned one of the most striking pictures in the exhibition, Lillian M. Genth's Sun Maiden, which hangs directly to the left as you enter the first gallery. A nude figure stands at the edge of a pool with the shadows of leaves cast upon her. At close range the whole thing is a blotch; at a distance the work resolves into a really extraordinary composition of sun and shade and color. The water is dark but translucent, the reflections drifting across the figure are tremulous with light. The picture is still not for the parlor, but would fit nobly in some garden house or marble veranda. Two pictures in which the mottled or mosaic effect is used with moderation and which have the true invitation to nature are Cullen Yates's Glimpse of Old Ocean, a view of bare rocks, that at a little distance are strikingly firm and real, with true water at their base; and James Preston's River, as cool and clean a combination of blues and whites as nature ever produced. There is space and a touch of witchery in Mr. Preston's level scene. With these should be named a successful Winter, by Childe Hassam, which gives, apparently, a view of Fifth Avenue by the Park involved in mist and snow. Mr. Hassam knows how to use his frosty blur; it is right to add, in passing, that a considerable number of the artists represented, seeking the romantic, seem to think that poetry is smear and smudge. They should consider The River noted above.

Of pictures in the older style, which would bring the delight of nature into a private room, there are still a fair proportion. C. H. Davis's Cloudland has a beautiful fluffy sky; A. L. Groll's Passing Shower in Arizona also brings down to earth the real heavens; Arthur Parton's Moonrise shows another kind of light swirling in the clouds; Jonas Lie's Last Gleam, though somewhat in the manner of the too-bold, gives an almost shivery effect of wind over a darkening land; W. A. Coffin's Maple in Spring, if a trifle hard and thin, takes one happily out of doors. E. W. Redfield's In Port deserves special mention for its aerial perspective, carrying the eye down a line of vessels along a straight wall into the misty distance. It is a masterly piece of work, but one observes with some alarm that the artist is departing from his earlier direct style for a conscious romanticism. Quite in the old simple, honest manner is Ben Foster's Late Afternoon, which we are inclined to distinguish as the most companionable landscape in the exhibition. It shows merely a rounded hill with a meadow and curving stream in the foreground. But it is real nature, and the eye would never lose its pleasure in the light green of the field, the dark green of the hill, and the pale blue sky above.

The portraits as a whole are not so notable as the landscapes. Sargent has portraits of Mr. and Mrs. Joseph Pulitzer, which manifest his usual competence and directness—superb craftsmanship, which yet leaves the observer with some feeling of discontent with the art and life it exemplifies. It makes our civilization just a trifle hateful. Cecilia Beaux has a Portrait Group of two children in white, who look a little too much as if they were posing to be photographed; C. N. Flagg shows an excellent and life-like picture of the sculptor Paul Bartlett; Ellen Emmet has an admirable portrait of Mr. H. C. Perkins, in which the face stands out well from a dark background; Dimitri Romanoffski shows a touch of Whistler in his face of Mrs. Romanoffski; H. G. Cushing exhibits an astonishing bit of nacreous color in the gown of his Portrait; and Sergeant Kendall in his Mis-

PUBLIC LIBRARY

chief presents a charming nude figure of a young girl.

As a whole, the exhibition contains plenty of talent and strength; it is not equally clear that the predilection for high decorative color and naked strength is altogether promising for the future.

The sculpture this year, to its great advantage, is exhibited in the riding school next door to the Fine Arts Building, lent for the purpose by Frank Gould. Here the most striking piece is D. C. French's Melvin memorial, Mourning Victory, a noble figure half emerging from a plain surface. The lower part of the body is draped, with the drapery held up also over the head so as to throw the face in a deep shadow which adds to its visionary expression. Besides this finely poetical creation, we can mention only Lorado Taft's The Blind, remarkable for its dramatic conception, and the figures prepared for the Brooklyn Institute by Messrs. French, Heber, Adams, Bitter, Lukeman, and Cox. They are of the customary symbolic style used for architectural ornament, good work but not memorable.

The Carnegie prize of $500 for the most meritorious oil painting in the exhibition has been awarded to Henry Brown Fuller for a huge canvas, "Triumph of Truth over Error." The Thomas R. Proctor prize for the best portrait goes to C. N. Flagg for one of Paul Wayland Bartlett. To Sergeant Kendall is awarded the Isidor Memorial Medal for his Mischief, mentioned above. In sculpture the Helen Foster Barnett prize of $100 went to R. I. Aitken for a statuette, The Flames.

G. E. Stechert & Co. publish a translation by Max Meyer and Robert Morris Ogden of Adolf Hildebrand's "Problem of Form in Painting and Sculpture," a thin volume, the importance of which is out of proportion to its size. Hildebrand's ideas of what is most important in art are not altogether unlike those of Bernard Berenson, for he makes the greatest qualities of painting and sculpture what Berenson would call "space composition" and "tactile values." Herr Hildebrand, however, undertakes to show by scientific reasoning why the realization of space and three dimensional form is the aim of art, and also how this aim is to be attained. Incidentally, his argument goes to show that certain characteristics of sculpture in relief or in the round which seem dependent upon the nature of the material used, and which, historically, may have had their origin in the necessities of material, are in reality based on philosophical principles of general applicability. "The properties of the material," he says, "compel the artist to adapt himself to a different mode of treatment in order to meet artistic requirements whose origin is quite independent of the material." His last chapter, on "Sculpture in Stone," is a plea for work conceived and executed in the stone itself, rather than translated from the clay model, on the ground that in such direct carving the exigencies of material and process tend of themselves to produce a style in consonance with the principles he advocates, while the natural tendency of modelling in clay is to produce a result antagonistic to these principles. In the one case the material fights for the artist, in the other against him. It is doubtful if modern conditions will ever permit of much work being done in this manner, but no intelligent sculptor, or for that matter no painter who cares for the noble and monumental in art, can read this little treatise without some stimulation of his faculties and clarification of his ideas.

Very different, and even more German, is the ponderous book, "Modern Art," by Julius Meier-Graefe, translated by Florence Simmons and George W. Chrystal (G. P. Putnam's Sons). One would wish to be quite fair to this "Contribution to a New System of Æsthetics," but is met by the initial difficulty of understanding what the author means. The fault is probably in part that of the translators, who make a jargon that can scarcely be called English of what one imagines must have been incomprehensible enough even in the original. Now and then in the chaos of words one seems to catch an idea by the tail, but one can never hold it long. In dealing with Ingres or with Puvis de Chavannes, the author almost convinces one of his sanity, but the next moment he is solemnly analyzing or extravagantly praising one of the worst aberrations of contemporary painting or sculpture. It is only the general drift of the book that one can be sure of. The author's notion seems to be that there is no modern art but the ultra modern, and that the wildest vagaries of men who died in lunatic asylums or by their own hands are to be accepted and explained as the logical and necessary expression of their epoch. If it were not for certain works recently seen in Paris—things too "modern" to be dealt with even in this very up-to-date book—it would be difficult to imagine anything more degenerate than many of the works here reproduced. If they are really representative of the spirit of the age, the commentary on the age is a sad one.

In his "Führer durch die Alte Pinakothek" (Munich: Süddeutsche Monatshefte) Karl Voll aims, with rare success, to impart information about the pictures in the great Bavarian gallery, so that the reader will be encouraged to use his own judgment and helped to think intelligently. The guidebook mentions only noteworthy canvases and uses them as texts for little talks on art history, technique, and criticism. Preserving a general historical scheme, the author dexterously interweaves appreciations and intimacies. There is all the wealth of well-sifted facts which one would expect from the former conservator of the Alte Pinakothek.

The exhibition of contemporary German art at the Metropolitan Museum will open January 4.

The second annual exhibition of advertising art will be held at the National Arts Club in this city January 5 to 21.

Among the exhibitions at the dealers' galleries in this city are colored engravings, by S. Arlandt Edwards, at Wunderlich's; paintings of Holland and France, Frank Townsend Hutchins, at Fishel, Adler & Schwartz's, till December 19; religious paintings, Henry O. Tanner, American Art Galleries, December 24; original drawings by noted American and English illustrators, Ernest Dressel North's, December 24; pictures, Childe Hassam, Montross's, December 26.

At the Henry Say sale in Paris, November 30, 280,000 francs was paid by T. Agnew & Sons of London for Lancret's La Ronde Champêtre.

At the meeting of the American Institute of Architects in Washington on December 15, the gold medal of the Institute was awarded to Charles F. McKim of this city.

Finance.

TO INVESTIGATE THE EXCHANGES.

Gov. Hughes's appointment of a committee to investigate the alleged abuses in the operations of the Stock Exchange and similar organizations, is both timely and wise. It is timely because the existence of what is tantamount to fictitious trading, on a large scale, has been repeatedly asserted by critics of the Stock Exchange, and because the recent report of the special committee of the Stock Exchange itself did not, as was generally expected, deal in a thorough way with this subject. The Governor's step is wise, because it obviates the danger that the Legislature might name a committee with the purpose of hostile agitation only. The matter is undeniably delicate. It deeply concerns financial interests because it has to do with the genuineness of the transactions and the quoted values on which investors in securities, and merchants dealing in commodities, base their calculations of profit or loss. Clearly, if evils have arisen in the machinery of such markets, and if the validity of such quotations is open to doubt, the matter should be examined by men who are not only impartial, but competent and conservative. These requirements have been abundantly met by the Governor in his selection of the committee.

What are the conditions which the committee is called upon to investigate? We shall consider for the moment only the Stock Exchange, because it is on that institution that the charges have chiefly converged. The most serious assertions are: first, that large capitalists have repeatedly used the facilities of that Exchange to create a semblance of abnormal activity by giving out simultaneously buying and selling orders, in the same stocks; second, that they have used the same machinery of "matched orders" to produce the appearance of a violent rise or violent decline in prices, their agents being carefully instructed to effect these transactions, so far as possible, merely through sales to one another. It is alleged that such practices have become part and parcel

of nearly all the Stock Exchange "bull movements" of the past few years. The belief is widespread that there are well-known experts in Stock Exchange manipulation who are employed for that service and no other; and that the distinct purpose of the manœuvre is to deceive the investing public into a belief that the market is strong and real buying enormous, when, as a matter of fact, the authors of the scheme know that prices have already risen too high, and are "unloading" their own stocks on the deluded public.

As a matter of fact, the Stock Exchange, in its constitution and in its disciplinary practices, asserts and has repeatedly exercised the right of expelling members found guilty "of any conduct or proceeding inconsistent with just and equitable principles of trade." This language is certainly broad enough to cover such performances as we have referred to above. The Stock Exchange governors did take action, for example, only lately, in the notorious case of A. O. Brown & Co. After an exhaustive hearing, the members of that firm were expelled on two grounds: first, that they had "undertaken to impart to the market, to the great injury of investors, holders, and dealers in securities, untrue and fictitious evidence of demoralization and panic, by creating the appearance of a great liquidation and sale of securities, all of which, as a matter of fact, proceeded from themselves"; second, that "knowing their own financial condition to be critical," they "gave to their fellow-members of the Stock Exchange a vast number of orders for the purchase and sale of an enormous amount of securities," thus creating obligations which they could not meet. The case was seemingly in point; but even the Stock Exchange admitted unofficially that the offending members were in reality expelled for trading when they were insolvent—which was certainly a serious abuse of their Stock Exchange privileges, but not altogether the abuse to which public attention has been drawn. The questions therefore which Gov. Hughes's committee will have to ask are: Have the Stock Exchange authorities used their abundant powers so as to prevent those evils; and if not, then what safeguards can be thrown around the investors by the State?

The real gist of the matter may be learned by observing the present Stock Exchange market, and by reading the comments on it of well-informed critics. It may be well also to recall the testimony submitted only a few weeks ago in the Morse trial, showing from the record the most brazen "washing" of Ice shares on the Stock Exchange. Morse repeatedly figured as both buyer and seller for enormous amounts, which almost exactly balanced. Moreover, the subscription by a syndicate, in 1901, of $25,000,000 cash for no other apparent purpose than to create an artificial and in effect fictitious Stock Exchange market for the newly-listed United States Steel shares, was itself a basis for reasonable suspicion. These are the episodes and practices which will engage the attention of the committee. It is time that light should be thrown on all of them, and that we should learn how they are to be dealt with hereafter.

BOOKS OF THE WEEK.

KREHBIEL'S CHAPTERS OF OPERA

With 70 illustrations

and Index, 435 pp. 8vo, $3.50, net. By mail, $3.72.

The *Tribune's* famous musical critic here treats of Operas in New York, most of which he saw, from the earliest days through the season of 1907-8. The book contains telling critical estimates, human and humorous anecdotes and a wealth of fine pictures.

HENRY HOLT AND CO., 34W.33d St.

A Great Biographical Series.

THE MEMOIR SERIES

70 VOLUMES NOW READY

Recent representative biographies presenting personal and critical studies of noteworthy characters in history, literature, and society.

They all undertake to present a study of character as connected with environment and an analysis of the influence exerted by each character upon his own generation, and upon men and women of future generations.

A complete illustrated catalogue of 40 pages will be sent on application.

G. P. PUTNAM'S SONS, NEW YORK and LONDON

OUR LIBRARY SERVICE

We have recently supplemented our service to Libraries, by procuring Out-of-Print and Scarce Books, and by importing English books.

Our Educational Catalogue contains a full list of Supplementary Reading, indicating the grade to which each title is adapted.

Our Clearance Catalogue contains overstock at special prices, and an alphabetical arrangement by authors of all cheap editions of Recent Popular Fiction and Standard Library 12mos in one list.

Our Library Catalogue of 3,500 approved titles, following A. L. A. lines, is of great convenience to small libraries.

Our Monthly Bulletin notices promptly every new book of importance.

These Catalogues are sent on request.

Three notable features of our service are: Promptness, thoroughness, and low prices.

DESIGN IN NATURE

Illustrated by Spiral and other Arrangements in the Inorganic and Organic Kingdoms as exemplified in Matter, Force, Life, Growth, Rhythms, &c., especially in Crystals, Plants, and Animals. With Examples selected from the Reproductive, Alimentary, Respiratory, Circulatory, Nervous, Muscular, Osseous, Locomotory, and other Systems of Animals. By J. BELL PETTIGREW, M.D., LL.D., F.R.S., F.R.C.P.; Laureate of the Institute of France; late Chandos Professor of Anatomy and Medicine in the University, St. Andrews; Fellow of the Royal Botanical, Medico-Chirurgical, Royal Medical, Literary and Philosophical, Harveian, and other Societies. Illustrated by nearly 2,000 Figures, largely original and from nature. In 3 vols., 4to., 1,470 pages, price, $16.00 net, per set.

This work deals with many of the more important problems of Philosophy and Life so keenly discussed of late years not only by scientists, but also by the general public. To give breadth to the inquiry, the leading sciences have been laid under contribution, it being pointed out that the animal is indebted to the plant, and the plant to the Inorganic Kingdom—that all things living and dead are correlated and interact according to common laws, which alike govern the Inorganic and Organic Kingdoms.

The Author endeavors to show that the combinations of matter, force, mind, and consciousness are practically endless. He seeks to prove that inorganic and organic matter, and physical, vital, and mental force, are not opposed to each other; that a Creator, Prime Mover, or First Cause is necessary to produce dead and living matter, and physical, vital, and mental force, and that the same laws, to a large extent, dominate all.

A History of English Journalism to the Foundation of the "Gazette"

By J. B. WILLIAMS. With a Portrait of Charles II. and 5 Facsimiles. 8vo. pp. xii+294, price $3.00, *net.*

This is an entirely original account, on a scale never before attempted, of the origin and early history of English newspapers, and nearly all the matter contained in it is new. It tells the story from their commencement to their culmination in the still existing official "Gazette," and describes all the principal writers and their careers.

In Search of a Polar Continent (1905-7)

By ALFRED H. HARRISON, F.R.G.S. With 52 Illustrations from Photographs taken by the Author in the Arctic Regions, and a Map. 8vo, pp. xx-292. $3.50, *net.*

Mr. Harrison's object was to explore the unknown region off the North American coast of the Arctic Ocean, but he first travelled 1,800 miles by waterway through Northern Canada, continuing to the Arctic Ocean with dogs. Being obliged to abandon his supplies he spent two months with the Eskimo, whose manners and customs he describes. He next returned to Herschel Island and made a voyage to Banks Land in a steam whaler.

The Nation.

NEW YORK, THURSDAY, DECEMBER 24, 1908.

The Week.

Mr. Carnegie's field-day before the Ways and Means Committee was marked by such slaughter as has scarcely been seen since Bannockburn. Dead and dying "standpatters" covered the ground. Their discomfiture was the more notable from the fact that they had expected to do the triumphing themselves. It was all very fine for Mr. Carnegie to write a magazine article, but wait till he had to face the expert cross-questioning of Payne and Dalzell! The subpœna to compel his attendance was issued with many nods and wreathèd smiles: come and see the confident Scotchman butchered to make a protectionist holiday. Well, the eager audience was there to see. The cleaver, however, was not in the hands, but in the heads, of Payne and Dalzell. Amid all the amusing sallies and audacities of Mr. Carnegie's testimony, one or two points of the utmost importance remain fixed. It is certain, for example, that the old steel duties are gone, never to return. No Ways and Means Committee, no party, could hold up its head after proposing to reënact them. The supporters of such rates would be laughed out of Congress, and covered with ridicule throughout the country. From one set of needless and offensive tariff duties Mr. Carnegie has powerfully helped to free the American people; and the same arguments which he offered will apply to other schedules in the tariff—even to those which Mr. Carnegie would like to see retained in their high protectionist form. Incidentally, Mr. Carnegie brought out the essentially partial and prejudiced nature of the statements of interested manufacturers and others at the Ways and Means hearings. "If a judge was interested in a cause, you would not respect his decision, would you?" With that simple question, Mr. Carnegie swept away the *ex-parte* representations which had been made to the committee. Men come with solemn faces to specify what taxes must be levied to keep their business from ruin, but they are judges in their own cause; they are seeking merely to put money in their own pockets. This has always been the vice of tariff hearings—a procession of millionaires who go to Washington in the form of paupers to beg tariff crusts.

One belated diversion the high-tariff people are now trying to make. They betray a sudden anxiety about the revenue. It may be, they say, that a case has been made out for lowering or abolishing certain duties, which are not needed for protection, but what is the Treasury going to do for money? They point to the huge and constantly accumulating deficit—nearly $60,000,000 for this fiscal year alone—and ask how we can possibly spare the income from high duties. But the moment you begin to talk of the tariff as needed for revenue, that moment you abandon the protectionist point of view. To fix the duties at a level where they would produce the greatest revenue is a process which has nothing to do with protection. Instead of keeping up the rates for the purpose of bringing in more money, the true way might be to cut them in two. This was the great economic truth which David A. Wells established when Commissioner of Internal Revenue. He urged the reduction of the tax on whiskey from two dollars to one dollar a gallon, on the ground that by halving the tax, you would double the revenue; and the result showed that he was right. The same principle would apply in the case of hundreds of tariff taxes. If it is really revenue that we want to get from them, they ought to be lowered rather than raised. Ten automobiles imported under a tax of $100 mean twice the revenue produced by a tax of $500, under which only one would be imported. If the argument on the score of greed and oppression is all against the high tariff taxes, so is the argument from revenue. Any competent Finance Minister with a free hand—a Gladstone, a Turgot, any minister responsible for the finances of Germany, or France, or England to-day—would jump at the chance of raising the needed revenue for the American government. He would see vast sources of taxation here practically untouched. We can but hail this new anxiety of the "standpatters" over the condition of the Treasury. It may lead them to recall Senator Aldrich's admission that of all sources of revenue a protective tariff has become the most untrustworthy.

Senator Knox's acceptance of the portfolio of the State Department under the new administration assures a conduct of foreign relations that is steady, unemotional, and thoroughly competent. In seeking a Secretary of this type, Mr. Taft shows, what was otherwise abundantly evident, that he wants quiet but able men about him. It is impossible to imagine Mr. Knox doing anything explosive. The fact that he has been a corporation lawyer, and that by his exposure of the unconstitutionality of Mr. Roosevelt's original railway-rates bill, he got on the list of undesirables, has not deterred Mr. Taft in looking for special skill and the judicial temperament wherever they were to be found. He is quoted as saying that Senator Knox was not merely a man in public life who was a highly qualified Secretary, but the "only one." This is a little hard on the others. Senator Lodge, for example, might be inclined to resent it, after his long service on the Foreign Affairs Committee of the Senate. Lodge has, indeed, been mentioned by his friends for the State Department, but, though Massachusetts would have been proud to see him disappear from the Senate, the country will think itself lucky to get Senator Knox instead.

Disquiet about the plans for the Panama Canal cannot fail to be deepened by Mr. Taft's announcement that he is to go to the Isthmus, accompanied by several expert and disinterested engineers, to study the whole question afresh. If a radical alteration of the plans is necessary, Judge Taft declares that he will not hesitate to have it made. What people will fear is that he has received privately from Col. Goethals more alarming reports about the conditions at Gatun than the public has been allowed to hear. It is known that the proposed dam and flight of locks at Gatun were from the first severely criticised by competent engineers. Their demand was that, at the least, more thorough exploration of the site, and more exhaustive studies, should be made

PUBLIC LIBRARY

before committing the government to a vast expenditure that might lead only to a catastrophe. That demand was brushed aside, but now, apparently, it is to be met, at this late day. Better late than never, of course, but the reconsideration will not enamour Congress or the country of a project which had such weighty expert opinion against it, and which is certain to cost three times the original estimate.

President Roosevelt had good grounds for his attack upon the New York *World*. That newspaper has not been able to substantiate grave editorial allegations of wrong-doing in the purchase of the Panama Canal. Any newspaper guilty of such blunders, whatever its motive, must take the consequences. Its dragging in of the names of Douglas Robinson and Charles P. Taft it now admits to have been wholly gratuitous. As in the case of its bogus interview with Kaiser William, an imposition of this kind damages not merely the *World*, but the entire newspaper fraternity. When it comes, however, to Mr. Roosevelt's language and method of rebuking Mr. Pulitzer, nothing can be said in their defence. The President of the United States should not so far forget himself and his office as to lay no restraint upon the bitterness of his anger and the violence of his epithets. Historian as he himself is, nobody should know better than Mr. Roosevelt that his long series of violent denunciations and of branding men as liars will always be a terrible indictment of the sanity and wisdom of his Administration.

Gen. Clarence R. Edwards, the chief of the Bureau of Insular Affairs, says in his annual report that it is still too early to decide the exact value to the government and the people of the islands of the experiment of educating Filipino students in this country. Every sign points, he affirms, to the "immense importance" of the movement. As for the individual students now here, their work has averaged "very good," and, in one or two cases, is of an "exceptionally high order." Naturally, one must consider the analogies to judge the value and effect of the policy. There is India. Thousands of its citizens have been educated in the homes of their conquerors, and some of them have won highest honors at the universities. But, while they have absorbed the culture of the West, they have gone home as much a race distinct as when they came, in their ideals and their hopes for their native land. It is certain that their influence has not been thrown in favor of the dominating white man and against the present stirring of the masses. So it is likely to be with the Filipinos. It is difficult to believe that the Filipinos who have been educated in this country will ever be at home anything but advocates of Philippine independence.

Whatever may have been the misconduct of certain soldiers of the Twenty-fifth Infantry at Brownsville, it is a fact that their brethren in the service are winning high praise. Following in the footsteps of a recent commander of the Cavalry School at Fort Riley, Col. H. L. Scott has again nothing but praise for the colored cavalry detachment under his command at West Point:

> The cavalry detachment (colored) has continued its excellent showing and has demonstrated still further the advantages of colored over white men for this duty. There is a waiting list now, and only experienced men having former service and very good and excellent records are accepted.

The Adjutant-General's annual report gives further praise to the colored troops by saying that, while the percentage of desertions among the white troops is 4.7 per cent., that of the colored is hardly more than one-half of one per cent. This trait of loyalty has long been noticed, as has the greater abstinence of the colored soldiers. Their devotion to their officers also distinguishes them. Incidentally, it may be noted that for nearly a year past there has been much friction between the troops of the Second Cavalry at Fort Des Moines and the people of that city, who declare that these white soldiers are largely a set of drunken rowdies. Press and pulpit have denounced them. It is not, then, the black troops who are wholly to blame for outbreaks of ill-feeling.

Pittsburgh offers us the latest revelations of corrupt alliances between "business men of high standing" and base politicians. Some bank officials there have, it appears, been paying councilmen handsomely to retain for their institutions the privilege of acting as depositories of city funds. Of course, the defence will be the old one, heard so often in New York, San Francisco, Philadelphia—wherever graft has reigned. Since the stockholders would make rather than lose money by the transaction, and the corrupt officials were there, the only thing to do was to be practical and "get the business." These same bank officials are doubtless models of correct deportment in their own homes: upon the adulterer, the swindler, the drunkard, the burglar, they look with holy horror. But to misappropriate bank funds to buy the city officials is sound business policy. Well, the result is for the city another story of shame, and for the bribers, let us hope, a straight road to jail. As President Eliot said in his speech here the other evening, the bribe-givers in a case like this are much worse than the bribe-takers. They sin knowingly and deliberately, and merely for the gain of a few dollars. Next month, the trial of some of the alleged bribe-givers in San Francisco will be held. If they and the Pittsburgh criminals are sentenced for long terms, it will be a blessing to the whole country, and may result in a decrease of crime among our most estimable and influential citizens.

The decision of the up-State Public Service Commission, in the matter of the Delaware and Hudson Railroad's proposed new bond issue, involves some important principles. In 1906, a trolley company operating in the district around Saratoga and Lake George, and known as the Hudson Valley Railway, was bought up, through subsidiary companies, by the Delaware and Hudson. The financing of the purchase was somewhat complicated, but it depended ultimately on the raising of $4,665,000, on its own short-term notes, by the Delaware and Hudson. These notes the company wishes to take up by placing a mortgage on its own property. That plan the commission now refuses to approve, on the ground that the trolley property is disconnected from the Delaware and Hudson's steam railway operations, and has "no definite relation thereto." To mortgage the Delaware and Hudson's own property in order "to pay a debt incurred in the purchase of a totally disconnected property" is contrary to the purposes of the statute, and cannot be allowed. The company's application, similarly to mortgage its own

property to take up $2,500,000 notes issued to buy up Pennsylvania coal lands, is also denied, on the ground that the coal property itself ought to be pledged for such a purpose.

The Delaware and Hudson officers announce that the matter will at once be carried into the courts. If so, we shall presently have a significant ruling on the scope of the commission's powers. Our own judgment is that the commission not only acted within its authority, but that its reasoning is sound. Its decision can be attacked, we believe, only by attacking the statute conferring the powers thus exercised. The case at issue is unusually clear, and with direct bearing on the fundamental purposes of reform, with a view to which the commission was created. One has only to recall the scandal of the Union Pacific's investment, during that same year 1906, of $120,000,000 of its shareholders' money—most of it raised by mortgaging the Union Pacific property—in the stock of railways "operating a wholly disconnected property," in some cases separated from the Union Pacific's field by half of the American continent. The seeming helplessness of Union Pacific shareholders and creditors, against this most obnoxious and suspicious use of trust funds and credit, shows plainly the need for such restraint as New York State has empowered its Public Service Commissioners to apply. Ambitious and speculating railway men may as well make up their minds that, whatever incidental defects in a given statute the courts may find, the principle of supervision of this nature has come into our legislation to stay. We are equally convinced that honest, conservative, and right-minded railway men will welcome it.

Turkey's first Parliament met in March, 1877, but was swept away by the outbreak of war with Russia. Turkey's second Parliament assembled at Constantinople last week under far more favorable auspices. The outlook in the Near East is for peace. When the crisis over Bulgaria and Bosnia-Herzegovina arose, it seemed doubtful whether the Young Turks would be equal to the double task imposed on them. They had to uphold the national dignity so as to prevent the partisans of the old régime from raising the issue of a false patriotism, and at the same time they had to be sufficiently conciliatory towards Bulgaria and Austria-Hungary to make war and a second swamping of the Constitution impossible. The Turkish reformers have met the demands of the occasion. The new Parliament has the sympathy of the outside world and the support of the vast bulk of the Turkish nation. Turkey has what Russia and Persia have not had in great abundance—wise and temperate leaders. That group of statesmen-reformers whom we speak of as the Young Turks have the amazing record of a revolution effected quietly, bloodlessly, and completely; of a difficulty with foreign nations handled with skill and admirable patience; of domestic restlessness held firmly in check. If the Young Turks have managed Sultan, foreign diplomats, and excited Constantinopolitan mobs so successfully, the chances are in favor of their mastering the science of parliamentary government.

People are asking whether Turkey will disappoint expectations as Russia and Persia have, in large measure, done. That depends upon what we mean. In the sense that no great change of government can fulfil all the hopes born in high moments of revolutionary enthusiasm, the new Turkish Parliament will prove a disappointment. Sooner or later it is bound to come into conflict with the old régime, whether in the person of Abdul Hamid or some other Sultan; sooner or later the hotheads will attempt to seize control, produce crises, bring about adjournments or dissolutions, and succeed temporarily, or lose temporarily. Yet we ought not to expect a constitution to work well within a year, or five years, when a comparatively simple matter like an education bill keeps the British government busy for a half decade, when a workmen's insurance bill is debated in France for years, and when the tariff vexes us for two-score years. We know well enough that England's Parliament took four hundred years in the growing, yet are surprised at the feebleness of the Russian Duma—age, two years, six months. We know that France has passed through one hundred and twenty years of revolution and reaction without reaching absolutely firm ground. Germany's Reichstag, after thirty-seven years, has far less power than the new Turkish Parliament, with its right to overthrow or impeach the Sultan's Ministers. Yet if within the next few months business is not running smoothly, public hopes will be dashed.

CIVIL-SERVICE REFORM AND THE CENSUS BILL.

The annual meeting of the Civil-Service Reform League at Pittsburgh last week was naturally an occasion of rejoicing over victories won. Joseph H. Choate, as president, reviewed the history of the movement, and showed the astonishing advance in forty years. Practically all Federal offices were once plunder for the spoilsmen, but now nearly two-thirds are protected. Going back seven years, to the beginning of Mr. Roosevelt's Presidency, we find that in 1901 the classified service covered 108,967 persons, whereas now it embraces 220,000. It must not be forgotten, however, that some 117,000 new offices have been created. When President Roosevelt entered the White House there were 127,000 officials not sheltered by the civil-service rules; to-day there are 132,000. We mention these facts only to show that, in spite of all that Mr. Roosevelt has done, the struggle must be kept up incessantly.

In the report of the council of the League, prominence is given to the pending bill for taking the Census of 1910. This came up in the last session of Congress, and as reported by Representative Crumpacker provided that the employees should be appointed on the spoils basis. At the time, this attack on the merit system was headed off, and the bill went over; but this session it has already passed the House in the old objectionable form, and the Senate Committee has agreed to report it, all dripping with spoils as it is. Under these circumstances, there should be prompt action, and the stiffest kind of fight. To throw the Census employees to the political wolves would not only give civil-service reform a severe check, but would cause this important work to be done wastefully and loosely. The facts are beyond dispute. That the average quality of the clerks engaged in the last two censuses was quite below that of persons appointed after competitive examination, was certified to by the President in his message of last January. On this point the testimony of Carroll D. Wright, in charge of the

Eleventh Census, is perfectly conclusive. After saying that the bringing of the employees into the classified service seems to him an absolute necessity, he declares:

> Had this been the rule in the Eleventh Census, there would have been, in my opinion, a saving of at least $2,000,000 and more than a year's time.

This makes the thing look a public crime. It is clearly a case for adducing that quotation from the Koran which John Stuart Mill cited in "On Liberty":

> A ruler who appoints any man to an office when there is in his dominions another man better qualified for it, sins against God and against the State.

We are aware of the defence which is made by the spoilsmen, in this particular instance. They allege that the appointment of the 4,000 Census clerks is only "temporary," and that the Civil Service Commission could not find or furnish sufficient candidates. But this the Commission itself flatly denies. It has already large numbers on its eligible lists, and stands ready to hold special examinations. Another assertion of those who prefer spoils to honest and business-like methods is that, under the civil service law, which provides for a geographical distribution of appointments, efficient clerks could not be had promptly. But for the Census employees it is expressly intended to waive this apportionment by States. All that is asked is a perfectly free and competitive examination, so that the most competent men may be chosen. Ah, reply the spoilsmen, but we also propose an examination. It is to be open to all "without regard to politics or personal or political endorsement." Only, it is to be a non-competitive examination. The proper comment on all this insincerity is made by Frederick H. Wines, who was Assistant Director of the Twelfth Census. As a matter of fact, no persons except those recommended by Congressmen were allowed to take these perfectly "open" examinations; and, says Mr. Wines:

> There were numerous instances in which an unsuccessful applicant was granted a second, third, or fourth trial, at the request of some Senator or Representative; and to the best of my knowledge and belief it occasionally happened that the rating made by the examiner upon the papers filed was arbitrarily changed after they left his custody. A rating of 75, with proper political or other endorsement, was sufficient to secure an appointment where a rating of 100 would count for nothing without it.

So much for non-competitive examinations. As President Roosevelt says, they are only "a cloak to hide the nakedness of the spoils system"—and a very tattered and transparent cloak at that.

The subject will come up in the Senate after the holidays. The spoilsmen have not a sound leg to stand upon. The President is strongly against them; the Director of the Census is against them; the best men in Congress are against them. It remains for public opinion and business sense to make themselves so felt that the impairing of the whole value of the Thirteenth Census may not be permitted, merely in order that Congressmen may divide 4,000 offices.

ENGLAND'S POLITICAL LEDGER.

With the prorogation of Parliament until the middle of February, a good deal of political stock-taking is going on in England. The work of the session is passed in review, the drift of bye-elections pointed out, the prospects of the parties canvassed, and the possibility of a dissolution and general election next year eagerly debated.

The most ardent supporter of the Liberal Ministry cannot deny that it has passed through an exceedingly bad year. Some successes it has had, with many failures, but the failures have been so large and sensational as to make people forget the successes. Certain legislative measures have been enacted, as promised. Chief among them is the old-age pension bill, which the Conservatives dared not oppose, though its principle is dangerous, its effectiveness doubtful, and its expense enormous. Another Liberal achievement is the Irish Universities bill; while the new legal protection thrown about children, and the shortening of the hours of labor in mines, may be adduced as a further redemption of Liberal pledges to pass laws for social betterment.

This would make up a fairly good record, were not the debit side of the ledger so long and lugubrious. Several capital pieces of legislation have been entirely lost. The Lords, it is true, were responsible for the defeat of the great Liberal temperance measure, the Licensing Bill. But this should have been foreseen. The time of the House of Commons, and the strength of the party, ought not to have been wasted upon a bill which the Lords were certain to throw out, unless the government had some firm and matured plan of dealing with the Lords thereafter. There was, however, no such plan. The Premier and members of the Cabinet had many brave words about "an irresponsible body," but the brave words have been empty. The direct method of meeting the issue would have been to dissolve and go to the country; but with the bye-elections running so ominously against them, the Liberals had no stomach for such a fight. So they are left, in this matter, chargeable with lack both of foresight and courage. Vacillation has also marked their course in two other important matters. They brought forward a new Education Bill, pressed it for a few days, and then withdrew it. They introduced a semi-protectionist measure relating to the English hop-industry, and shortly were forced to withdraw that also. All this gives an impression that there is want of leadership, or that the Cabinet or the party does not know its own mind. The net effect is to make the Liberal prospects depressing.

Predictions in such a time of hesitation and despondency cannot be worth much; but the shrewder opinion is that the government will neither resign nor seek the verdict of the country, at an early day. Mr. Asquith declared at the National Liberal Club that the government would not dissolve "at the time prescribed at its own caprice by an irresponsible assembly." Rather, the effort will be to rally the party and rouse public opinion behind a bill which will be in itself popular, and which will force the issue against the House of Lords. It is already intimated that the Chancellor of the Exchequer is drafting such a bill, or bills, in connection with the next budget. They will lay new burdens upon the land, and will impose fresh and heavy taxes upon the liquor trade. Then the Lords, as the great defenders of both landlords and liquor-sellers, will be asked what they are going to do about it. Tax bills they cannot amend. They will have to take them or leave them as the House of Commons sends them up. Should they venture to throw them, it would raise the issue of the power of the purse in a way that the Conservatives would find it awkward to meet. Should they, on the contrary, take the new taxes lying down, as they did the old-age pensions bill, it would

go far to prove that the Lords act, not from conviction, but solely out of a desire to aid the Conservatives. In either case, the Liberals might hope to score heavily. "Finance," as Mr. Asquith remarks, "is an instrument of great potency and also of great flexibility."

While it remains so uncertain what the Lords will do, in a given case, and what their functions are to be in the future, it is not possible to kindle much interest in projects for merely recasting the constitution of the Upper House. This must be the chief reason why the recent report of Lord Rosebery's Select Committee on the reform of the House of Lords has fallen so flat. It contains many fruitful suggestions. If its recommendations were to be adopted, the idea of hereditary legislators would be deeply cut into. According to the Rosebery plan, the hereditary peers, as such, could not be "Lords of Parliament" unless they had some special qualification, and had been elected by their brother peers. The plan would also cut down the number of bishops with seat and vote, and would bring in, from time to time, men of approved ability and worth to represent the nation as a whole. But there seems no likelihood whatever that any such scheme of reform will be taken up in the present Parliament. The burning question is quite other. Shall the Lords be allowed to be merely an appanage of the Conservative party? Can the Liberals devise any means of carrying out the promises which their leaders have been making, from Gladstone to Asquith, respecting the due curbing of the power of the Lords? These are the matters which are agitating English politics, and until some method be found of settling them, or pushing them aside, it will not be possible to get a serious hearing for a debate whether the Lords shall number 300 or 600, and whether senile and bankrupt peers shall be excluded from the Gilded Chamber.

SECRET SOCIETIES AND POLITICS.

In the present Turkish revolution the Masonic lodges are said to have played an important part. Just how much they contributed to the success of the constitutional movement is, in the nature of things, bound to remain unknown. But if the Young Turkish leaders did actually make extensive use of the lodge as a means of revolutionary propaganda, that was only another illustration of the aptness with which the East has been borrowing its methods of revolution from Western Europe. Conspiracy, of course, is the only way in which despotism can be fought at the beginning; but it is conspiracy carried on with liturgical pomp that seems most effective as a political instrument. The late Persian revolution was looked upon as largely the work of the Masonic lodges; and in Persia, as in Turkey, it will be remembered, constitutional liberties were won almost by a *coup d'état*. In Turkey the reform party has drawn its inspiration chiefly from France, and from that quarter the Masonic idea in its modern form probably came to Persia, too. That the secret fraternal lodges should be so widely active in the struggle for political progress among the Mohammedan peoples is only in consonance with the historical character of Freemasonry in Europe.

In this country we find it hard to think of our secret societies as stores of political dynamite. We may recall that there was once a very considerable anti-Masonic flurry and even an anti-Masonic candidate for President. But we look at that movement now as one of the popular delusions that will carry the most staid nation off its feet, especially when stimulated by the politician with an axe to grind. On the whole, we could not think of our institutions as being threatened by a secret organization of which our Presidents are often leading members, just as democratic England sees no danger in an order whose head was the Prince of Wales. Among us, besides, the secret order has gained a reputation for innocuousness in direct proportion to its immense popularity. Whatever may have been the early character of the Free Masonic lodges, they are now confounded in the popular mind here with numberless other orders, whose object, when it is not some form of business coöperation or mutual aid, is the indulgence of a rather childish fancy for dressing up and playing at mystery.

But in France, the anti-republican elements charge the Masons and the Jews, or rather the Jews through the Masonic lodges, with having brought about the great Revolution, and with fostering every subsequent movement against authority, particularly as manifested in the Church. It is an accusation which the Masonic lodges have naturally never troubled themselves to refute. It is almost like being charged with having discovered America, or with pernicious activity in perfecting the aeroplane. To a large extent, the Masonic lodges did prepare the way for the French Revolution. They were the great debating club in which the lower middle classes discussed the new ideas put forward by the leading radical thinkers of the time. Not even the connection of Freemasonry with a Cagliostro can deprive it of that blame, or credit, as we look upon it. And because the conflict between reaction and revolutionary France has continued to the present day, the Masonic lodges have continued in full vigor. Especially since the settlement of the Dreyfus affair, the conservatives profess to look upon the French government as a government of Free Masons and Jews. The Separation Law is regarded as the handiwork of the lodges. Government appointments and government policy are, so runs the accusation, determined upon at the sessions of the Grand Orient. This is exaggeration of a substantial kernel of truth. That the Masons are very influential was shown a few years ago in the revelations concerning Gen. André's management of the War Office.

The Masonic lodges are strong in Italy, where, too, they have been lumped with the Jews as sworn enemies of established religion. The election of a man of Jewish descent as Mayor of Rome is cited as proof. But in Italy, as in France, Freemasonry is anti-Christian, chiefly to the extent that the advocates of political reaction have used Christianity and the Church as a screen for their purely secular ambitions. It has been the misfortune of the Church in France that it has stood for monarchism, and in Italy that it has set itself against the national aspiration of a rejuvenated, united, and thriving people. If the Masonic lodges are always found on the side of social progress, and official Christianity is always found on the side of reaction, then militant Freemasonry is bound to be anti-Christian, just as under similar circumstances it would be anti-Mohammedan in Turkey and anti-Shintoist in Japan. Its menace to ecclesiasticism is all the greater because it does offer a ritual and a creed for the satisfaction of the normal man. It is easy to see, for in-

BURLINGAME PUBLIC LIB

stance, how in Turkey, with its motley of nationalities and faiths, the Masonic lodge would offer a national meeting-place for the friends of political progress. That common cause would bring them together, and the lodges' monotheistic creed is respectful alike of Christian, Moslem, and Jew. By as much as Freemasonry may hold truer to the principle of human brotherhood than the established churches, by so much more will it go on making itself felt in the struggle of backward countries towards emancipation.

THE HISTORIAN AND THE DOCUMENT.

A scholar like Signor Ferrero, whose views on so remote a subject as the foundation of the early Roman Empire are quoted by the column in the newspapers, has a serious handicap to overcome. Thoughtful people will be suspicious of him. Can an historian who is brilliant in style, bold in his new interpretation of well-thumbed sources, and given to marshal his facts in accordance with a preëstablished philosophy of history, be as trustworthy as he is fascinating? To start with, brilliancy itself is disquieting. It is all very well to recall that there have been scientists and scholars who have combined charm with authority, men like Huxley and Haeckel, like Gibbon and Mommsen. But at bottom we are still slaves of the ideal of painful dulness which, rightly or wrongly, we associate with the spirit of modern German research. We sneer at Dryasdust but are afraid of him. The brilliant historian or critic is regarded as fair game for the Ph.D. who has just finished counting his syllables. One is so readable, the other is so quite the other thing—the readable scholar must be erratic, like most of the brilliant people we know.

When an historian is not only brilliant like Signor Ferrero, but, like him, assumes to write history in the light of a theory of his own, he has committed the sin of sins, he has trespassed against the Law of the Document, which is at the basis of all historical truth. To gather as many "sources" as one can lay hold of and to quote them without changing the spelling, that is the art of historiography in its highest manifestation as pictured to budding young scholars. The old historians adulterated the pure stream of truth with personal judgments, original interpretations, political conclusions based on such a non-political source as a great poem, a famous picture or statue, or even a popular legend. Germanic rigor has done away with all that. Make use of tradition? Of course not. Make use of second-hand accounts, of collateral sources, of comparative conditions somewhere else, of gossiping memoirs, of ill-informed correspondence? No. The Document reduced to its most insoluble form, that alone will do. Truth lies in the treaty of peace as it was written down on paper, in the judge's decision as it was filed on the court's records, in the Senate document number so and so, or in the official report of the International Reform Association as compiled by its own secretary. No guesswork, no intrusion of the personal element now or at the time of the fact; we are after the truth alone, however uninteresting.

But how if the official document often turns out as untruthful as it is uninteresting? The formalities of diplomacy have always been such as to make the written agreement only partly expressive of the living motives and acts that have produced it. Two hundred years from now, an historian dealing with the economic condition of Spain in 1898 may point out how badly pressed for money the Spanish government must have been when it sold the Philippine Islands to the United States for $20,000,000. In the course of a few months we may have documentary evidence laid up for the future, showing how Turkey foolishly gave up her sovereign rights over Bulgaria for so many million francs, and sold Bosnia-Herzegovina to Austria for an equal amount. The future biographer of Senator Jones may prove that Jones could not have been caught in a poolroom raid on February 6, 1909, because on that day he was delivering a four-hour speech on Philippine sugar in the Senate. But, as a matter of fact, the Senator's speech got into the *Congressional Record* under "leave to print," and Jones was really betting on the horses on that February day. A candidate for a political nomination is successful by 49 votes to 48, whereupon his nomination is made unanimous. From that unanimous vote history may draw wrong conclusions as to his popularity. The official programme of the annual meeting of the International Reform Association commemorates a President-elect of the United States as its principal speaker. But, as a matter of fact, the President-elect was at home that night with a bad cold. The files of the New York *Star* for 1912 disprove the common belief that Mme. Cavalcanti had been secretly married on March 11 to Signor Perugino, by reporting her glorious impersonation of "Aïda" on that night. Actually, the *Star's* musical critic played bridge that night, and wrote up his account from the official advance notices; so he didn't know that Mme. Delmonte had been substituted for Mme. Cavalcanti.

It is easy enough to overstate the case. Document can be used to check up document, source balanced against source, and error tracked down. But that is just the process which calls for brilliancy—intuition, imagination, the dramatic instinct—in the historian. To suspect your document, to feel that it ought to say something else than it does, to cast it aside sometimes on the principle that men in ancient Rome were a good deal like what they are now, and consequently used official phrases that stood for very little—these are the qualities which Dryasdust seldom reveals. He will write you the life of the late Emperor Kwang-Su on the basis of the official biography in 300 volumes, now being prepared by Chinese historians. But if Dryasdust should overlook the fact that Chinese chroniclers make an Emperor's life what it should have been and not what it was, what a mess Dryasdust would make of it!

Danger there is, undoubtedly, in the other method. If you believe the newspapers, Signor Ferrero is doing more to destroy the ancient world than Goths, Vandals, and fanatic monks from the Thebaid ever did. Quintus Horatius Flaccus did not really like to speculate on pleasure, and fortune, and death; was not really fond of Mæcenas; did not really thrill at the sight of snow-capped Soracte; he only wrote advertisements for the Falernian and Cæcuban Wine Growers' Association. Mark Antony did not marry Cleopatra because she was a lady of serpent-like wiles and infinite variety, but because he needed her money to conquer the Persians. Shall we find next that Medea did not murder her children out of insane re-

sentment at Jason, but because they interfered with her club meetings? Was Leander really training for the annual swimming Marathon of the Hellespont Athletic Club? Did the elder Brutus sentence his son to death in order to collect the life insurance? We suspect, however, that in all this there is more of the gifted young newspaper reporter than of Ferrero.

AFTER THE HIGHER CRITICISM—WHAT?

A few days ago a professor in the University of Chicago was reported as saying that Christianity is not of divine or miraculous origin:

> It is not a religion from a god, but an achievement of man, who created his own gods, in ancient times, in order that he might have them to help him in his defencelessness and ignorance; to aid him in conquering his foes, and to dispel the darkness of his future and the fear of death. More and more people are giving up the idea that their religion is something handed down to them from a divine source. . . . Consequently, religion is on a more rational basis, as people are cultivating it just as they cultivate music, language, science, and morality.

To verify this quotation is hardly necessary; for if this particular man did not say this particular thing, the words fairly represent the attitude of many of our higher critics. Their comments recall the satire of Kipling's "story of Evarra—man—Maker of Gods in lands beyond the sea." It is all very well to protest, as the higher critics do, that the Bible still remains one of the noblest monuments of literature. In the past people have not cared whether this book was literature or not; the vital point was that it was the inerrant word of God and the infallible rule of life. If it be robbed of this authority, what, we may ask, is science offering as a substitute? What is to come after higher criticism has done its work?

We put the question in no spirit of hostility. Far from it. We would have the truth at any cost. We are not among those who would cling to a superstition because it happens to be comfortable or because it helps to keep order among the masses of the rude and ignorant. We would not dwell in a fool's paradise. If the Church rests its claims on certain traditions and documents, we would have those traditions and documents submitted to the most searching tests; for nothing can be gained in the long run by building either a house or a church on a foundation of sand. If we have been deceived as to the origin of the Bible and the sacraments, if the Ten Commandments were not handed down from Sinai, let us face the disagreeable facts. But let us also face the facts that if the moral law is not God-given, if the fear of hell and the hope of heaven are illusions, the average man will not look upon life and its duties quite as he did a few decades ago. Clergymen sometimes attempt to conceal the change from themselves and their followers by sticking desperately to the old phrases—though in a new sense—and by sweeping generalizations about the unvarying validity of the essential sanctions of morality. But educated people perceive the hollowness of such formulas. Accepting the methods, if not in every case the detailed results, of scientific criticism, they turn to our professed spiritual guides for some reconstruction of creed that shall touch the emotions as did the old which is now destroyed; or, as Wilfrid Ward has put it, for something that shall keep "a truly spiritual ideal of life . . . untainted by the maxims of an unbelieving generation," and shall help "the affections and the imagination against an importunately visible world."

There are, we grant, men of stoic temper with whom such considerations weigh little. They will pursue their way steadfast and unterrified though the earth rock beneath their feet. Few of us, however, are made of such stern stuff. For the rank and file of humanity it is not exhilarating to reflect that the night is behind and before us; that our tiny globe is but one of a million spinning through the unfathomable gulfs of the universe; that we ourselves are but microscopic specks crawling for a little while in the dim and fleeting light; and that our consolation and our bulwark have been a few silly fables of our own feeble invention. In a recent book which treats the lives of two devout women, "Memorials of Two Sisters, Susanna and Catherine Winkworth," is a striking passage which in reality applies not to one sex only, but to all mankind:

> Women feel the frets and the anxieties of life so keenly, that they need this refuge in the larger, serener life of heavenly love. . . . Their life seems often at once so engrossing and so trivial that they need some points above it, from which they may see how it all forms part of the infinite web of human life through which God's kingdom is to be realized on earth, to give it any freshness and value.

This recourse to "the larger, serener life of heavenly love" is impossible for persons who are convinced that this "love," in any comprehensible sense of the term, is a fiction, and that their gods and their religion are of purely human manufacture. A cold, relentless, impersonal power, even though it make for righteousness, is not the same thing as a father that pitieth his children. For the jubilant lines,

> Jesus lives! no longer now
> Can thy terrors, death, appal us;
> Jesus lives! by this we know
> Thou, O grave, can'st not enthral us,
> Alleluia!

we have the lament:

> Now he is dead! Far hence he lies
> In the lorn Syrian town;
> And on his grave, with shining eyes,
> The Syrian stars look down.

What, then, does science say to those who long to feel that the eternal God is their refuge and that underneath them are the everlasting arms?

The difficulty is staggering, but the duty of the leaders of Christianity is none the less imperative. They cannot much longer postpone the task of addressing themselves to it with energy. For at present most of the churches seem to be drifting without chart, compass, or pilot. We hear on every side the complaint that men of character and capacity will not enter the ministry, but there was never a time when character and capacity were more needed for this great business of readjusting ancient beliefs to modern knowledge. No ecclesiastical organization can retain its vitality or can serve mankind unless it can lift them above their trials and fortify them against temptation; for what shall it profit us to turn from the doubts and hesitancies of our daily toil to the profounder doubts and more disquieting hesitancies of a stumbling, groping church, uncertain whence it came and whither it goes? "Thou art the true peace of the heart," cried the author of the "Imitatio," "thou art its only rest; out of thee all things are full of trouble and unrest. In this peace that is in thee, the one chiefest eternal Good, I will lay me down and sleep." But for the higher critics and their confused disciples of to-day the promise of a peace which passeth all understanding is nothing

more than an empty echo from the age of faith.

AN APOSTLE OF NEW SPAIN.

So much has been written of the awakening of Spain in the last decade, that many persons think of the Spanish nation as already well started on the high-road to religious freedom and prosperity. But as keen an observer as Havelock Ellis finds the typical Spaniard still buried in self-contented indifference, or, at best, but turning in the first restless movement before the dawn. With the exception of Catalonia, whose active, progressive people are abreast of the other nations of Europe in arts, manufactures, and political ideals, the only general evidence of a reaction against the past has thus far been literary—a suggestion of the France of Voltaire, Diderot, and Rousseau in the eighteenth century. Perez Galdós, the chief figure in Spanish letters at the present day, has long been an ardent champion of modern religious and political theories, and the most prominent contemporary dramatist, José Echegaray, has repeatedly made social problems his theme. For several years, however, Señor Galdós has been devoting his best energy to the theatre, leaving only Sra. Pardo Bazán and Palacio Valdés of the older generation still engaged in writing novels; and of these authors, Sra. Bazán is now busy for the most part with literary criticism, while Sr. Valdés seems to have declined from the power he revealed in his earlier works. With the best writers of the old school cultivating the stage as the medium through which to propagate their theories, there has come into prominence a new group of novelists, less competent as artists, to be sure, but inspired with a more virile craving for progress, a more violent spirit of protest against the torpor of Spain. This intense reaction against the Church, a priest-ridden royalty, and the general somnolence of the people, ignorant and indifferent, is the haunting characteristic of the apostle of this new movement, Vicente Blasco Ibáñez.

His life itself has been a fascinating story of adventure. Born of Aragonese parentage at Valencia in 1867—his father was the proprietor of a dry-goods shop—he was graduated in law at the local university. Even as a student he was conspicuous for his revolutionary ideas, and at the age of eighteen was sentenced to six months in prison as a result of a sonnet against the government. In 1890, forced to flee from Valencia to escape a second imprisonment, he took refuge in Paris, where, two years later, he received an amnesty. His turbulent spirit, however, soon involved him in new troubles, this time as the head of a popular demonstration against the measures employed by the government in the attempt to suppress the insurrection in Cuba, and once more he fled. On his return, three months later, he was arrested and condemned to two years in prison. With his release in 1894 begins his career as a novelist; up to that time his only literary efforts, aside from two negligible volumes of impressions of Paris and Italy, had been journalistic. The founder of a Republican paper in Valencia, *El Pueblo* (The People), at first its editor, reporter, and reviewer, he has succeeded in making it one of the most influential sheets in Spain. Through his publishing-house he has directed a library of several hundred volumes of translations of European literature, for the most part works on science and sociology, by such writers as Spencer, Tolstoy, Renan, and Nietzsche. It is not surprising that his political activity found recognition in his election as Republican Deputy from Valencia, and that he soon became the leader of his party in the Cortes. After eight years of service he has retired from "militant politics," to use his own phrase, and is now devoting himself wholly to literature. His one purpose has been and is to arouse his people, to stir them from their ignorance.

The scene of Sr. Ibáñez's early novels is laid in Valencia and the surrounding district. Between 1894 and 1902 he produced six novels and two volumes of short stories, which present a panorama of the life and customs of the region, portrayed with rare insight and intense sympathy. The main theme of all the work of this period is the conflict between the individual and a society deep-rooted in the cruel, selfish prejudices of the past. The best work of this group, "La Barraca" (The Farmhouse), is a picture of the life in the *huerta*—the market-garden district outside of Valencia—and the persecution of an honest farmer and his family by his neighbors, who harbor the tradition that the land of which he has become the tenant shall never be cultivated. Their persecution is successful: his house is burned over his head, and Batiste starts out once more into the world, ruined but undaunted. In marked contrast to these studies of modern perversity stands "Sónnica la Cortesana," a romance of the siege and fall of Saguntum, in which Hannibal appears as one of the characters. From the misery of to-day we are transported into the sumptuous gardens of the Greek courtesan; we live in an exuberant, sensuous atmosphere of youth and beauty; the air is vibrant with a sturdy patriotism.

With his election to the Cortes, Sr. Ibáñez left the novel of manners and in the next three years produced three works—"La Catedral," "El Intruso," and "La Bodega" (The Saloon)—which, had he belonged to the seventeenth century, would have appeared as pamphlets. The plots of the books serve merely as a framework in which to carry his propaganda. Through the long harangues of his anarchistic heroes, Gabriel Luna, Salvatierra, and the doctor, Don Luis, he attacks mercilessly the Church, the Jesuits, and the drunkenness of Spain. Behind these specific objects of his animadversion, lurks the real enemy; it is the people who are to blame; their ignorance and self-seeking are the sources of their subjection and suffering. This, indeed, is the fundamental teaching of all of his novels. A French critic has observed of Sr. Ibáñez's work: "Il est un personnage que le romancier n'a décrit nulle part et qui, invisible, domine l'œuvre: c'est La Fatalité." To make such a criticism is to misinterpret his whole philosophy of life. It is man who is the cause of the evils in this world—man with his pettiness, his self-centred narrowness. And it is just this conviction that human suffering is the result of human weakness, and not a divinely sent curse, that inspires the author to struggle forward toward the ideal of the future, to hope for a day when charity is unnecessary and men are brothers. Without doubt, he would prefer that this progress should be a gradual development through education, but he is convinced that Spain is too firmly fixed in her traditions to make such a growth. In "El Intruso," he says:

> In this country we must take a violent leap, must pass, without any bridge, from the beliefs of four centuries ago—still intact and powerful—to modern life.

And yet his anarchy is never of the bomb-throwing type; Gabriel Luna perishes in the attempt to save the treasures of the Cathedral of Toledo from robbery at the hands of the very men in whom he has inculcated his teachings. We may judge from Sr. Ibáñez's position as Republican deputy to the Cortes that his faith is built on a pacific regeneration, none the less radical for its freedom from the horrors of revolution.

His later works have shown a return to his earlier style. "La Horda" (The Rabble) is a picture of the sordid life of the refuse collectors in the suburbs of Madrid, a subject already treated by Pio Baroja in "La Busca." "La Maja Desnuda" (from Goya's well known picture), published in 1906, is easily his most artistic production, and fittingly, for it is at once an acute psychological study of the conflict between the artistic temperament and human love and a critique of Spanish art in which Goya's realism is extolled. The last of his novels "Sangre y Arena" (Blood and Sand) is a scathing criticism of the bull-fight, "that survivor of the *auto-da-fe*." Despite the vigor of its inspiration, it is distinctly inferior to his previous work.

Blasco Ibáñez is preëminently a preacher of reform. Social justice is

his ideal. If we lend him a willing ear, it is in large measure due to his splendid manliness. "In his life and in his works," to quote from Mr. Ellis, "this son of indomitable Aragon has displayed all the typical Spanish virility, the free-ranging personal energy, the passion for independence which, of old, filled Saragossa with martyrs and heroes." However little sympathy we may have with his materialism, however Utopian his dreams may be, we cannot but admire and respect him as a man. As an artist he is less deserving of praise. His enthusiastic devotion to Zola and naturalism—a moribund *genre* which has found several tardy adherents in Spain, among them Sra. Bazán and Sr. Valdés—too often leads him into violation of the highest standards of art. He is carried away by his exuberant fancy. But he has an extraordinary insight into life and the human heart; his characters move like men and not like puppets, and his plots, when they are not meant to serve as backgrounds, move with climactic interest. In his style certain characteristics will be obvious even to one who is not a thorough master of the tongue. Leaving aside the question of his Gallicisms and bad grammar, with which he is charged by his Spanish critics, his wonderful force and visualizing power cannot fail to make an impression. His riotous imagery, his lack of grace and elegance, may be in part ascribed to hasty production. Now that he is free to give his best to his literary work, we may hope to find in his two next novels, to be published in January, a considerable advance in artistic merit.

In Spain his popularity and influence have been remarkable. No novelist, except Sr. Galdós, has been so widely criticised or so generally defended. In the rest of Europe he has been rapidly gaining a reading-public since the appearance of "La Barraca" in the *Revue de Paris* in 1901, under the title of "Terres Maudites." Reviews of his works have appeared in the leading Continental periodicals, and almost all of his novels have been translated into the other languages of Europe, with the single exception of English. The apathy of the English world toward his work may be due to a complacent sense of freedom and prosperity that makes us indifferent to the problems that confront the Continent. To the Spaniard, more than to any other people of Europe, these questions are at present vital. Since Spain is freed from the burden of her colonies, she may undertake her own upbuilding. It is not easy to foresee the consummation of this process of development and regeneration. At least, in Sr. Ibáñez Spain has a leader whose courage is strong, an apostle whose faith in the future is firm. Whether or not he lives to see the fulfilment of his hopes and ideals, he will have borne no small part in the formation of a new Spain.

R. H. Keniston.

Cambridge, Mass.

DONALD GRANT MITCHELL.

In one of his later prefaces, Mr. Mitchell complained that the public would persist in buying and reading his "Reveries" and "Dream Life" to the neglect of his better work. It is a good deal to lose a man who can complain of any sort of popularity; it is an act of piety to point out that his death means something more than the loss of the author of those old-fashioned pieces of sentiment. Just the other day, every one was saying that Professor Norton's disappearance was the end of the famous writing New Englanders. Now the death in quick succession of Thomas Bailey Aldrich, Edmund Clarence Stedman, and Donald Grant Mitchell closes a group who were, whatever their birth and latest associations, distinctly of New York, the inheritors of Irving, and Willis, and Paulding, and others whose names are fainter echoes.

These men of our commercial city were of a different fibre from the New Englanders, not so great, their aim not so high. They were, in no contemptible sense of the word, amateurs. Mr. Stedman may have attained a grave dignity when he expressed the upright man of the world's ideas on national events; Mr. Aldrich had a refinement of artistic touch which greater artists often lack; but in their verse there is still something of the amateur, a consciousness that they were speaking to a community in which literature had no recognized place, and that they must not take their writing too seriously. And it is as an amateur of the finer sort that "Ik Marvel" also will be remembered.

Mr. Mitchell was born at Norwich, Conn., in 1822. After a youth at school and on a Connecticut farm, he travelled abroad, and then settled in New York to practise law. For a few months in 1853-4 he was United States Consul to Venice. On returning to this country he bought some land about three miles from New Haven, and there at Edgewood, as he christened the place, lived as farmer and landscape gardener and student, until his death on Tuesday of last week, at the age of eighty-six. He had begun early to write, and the product of his New York years was "Fresh Gleanings" (1847), "The Battle Summer" (1848), "The Lorgnette" (1850), "Reveries of a Bachelor" (1850), "Dream Life" (1852), and "Fudge Doings" (1855). Other stories and miscellaneous volumes he published later, but the best of his work and of his life is summed up for us in two books, "My Farm at Edgewood" (1863), which gives his personal experiences with the soil, and "Wet Days at Edgewood" (1865), in which he sits in his library and chats agreeably of a long line of agricultural writers and country poets from Hesiod to the latest scientific analyzer of soils. It was the life of a gentleman and a scholar, dignified by daily and practical contact with the land, enriched with the acquaintance of old books.

If his writing has not the power of great literature, it escapes also the professionalism or illiteracy that mars most of our back-to-the-country product. There is in it nothing of that parade of nature of the professional penman, who goes out to the fields with a fountain pen, instead of a spade, and, above all, none of that ignorance of letters which gives a cheap contemporaneity to the work of those who have their eye on the book market. When, in "My Farm at Edgewood," Mr. Mitchell is engaged in a practical discussion of planting and grafting pears, he still carries memories of his reading with him:

> Early bearing, and brilliant specimens favor the quince; but hardiness, long life, and full crops favor the pear from its own roots. If a man plant the latter, he must needs wait for the fruit. Mœris put it very prettily in the Eclogue:
>
> Insere, Daphni, pyros: carpent tua poma nepotes.

Or when, in his "Wet Days at Edgewood," he is engaged with the ancient agricultural treatises on his shelves, he still has in mind his own homely adventures with the earth:

> And yet I delight in finding black-letter evidence of the age of the traditions and of the purity with which they have been kept. An important member of the County Society pays me a morning visit, and in the course of a field-stroll lays down authoritatively the opinion that "there's no kind o' use in ploughing for turnips in the spring, unless you keep the weeds down all through the season." I yield implicit and modest assent; and on my next wet day find Ischomachus remarking to Socrates: "This also, I think, it must be easy for you to understand, that, if ground is to lie fallow to good purpose, it ought to be free from weeds, and warmed as much as possible by the sun." And yet my distinguished friend of the County Society is not a student of Xenophon. If I read out of the big book the same observation to my foreman (who is more piquant than garrulous), he says—"Xenophon, eh! well, well—there's sense in it."

Nor is our gentleman-farmer's memory confined to the classics—though Virgil is evidently most often in his mind. On a murky November day, he is called afield by the lines of the old vision—

> A May morwenynge
> On Malverne hilles;

and Piers Plowman lays open for him "the first farm-furrow upon English soil." Or, another day, the "Dreme" of Chaucer calls before his eyes the great plain of Woodstock, stretching away under his view, all green and white—

"green y-powdered with daisy"; or Sir Hugh Platt tells him how Sir Thomas Carew astonished the Queen with the sight of a cherry-tree in full bearing, a month after the fruit had gone by in England; or, again in November, the pelting rain reminds him of a similar day spent years since in an English inn, when his only entertainment was a much-bethumbed copy of an old eighteenth-century book, "The Clergyman's Recreation, Showing the Pleasure and Profit of the Art of Gardening," by the Reverend John Laurence.

It is this happy blending of the practical present and the imaginative past that marks Mr. Mitchell's two books as the work of an amateur, if the amateur may be defined as the gentleman who cares as much for gracious tradition as for immediate efficiency. There are whole libraries printed these days on every aspect of country life—books instructive, sentimental, picturesque, humorous, or homiletic—but we cannot, at the moment, recall a single living American writer of bucolics who bears the stamp of sound education, to whom the "Georgics," or even the great English poems, are ever present suggestions. The tradition of the gentlemanly amateur seems to be lost with the passing of our genial "Ik Marvel," and some readers will cherish his memory for these rare traits.

NEWS FOR BIBLIOPHILES.

It has been pointed out in two or three sales catalogues that some copies of the first edition of Fielding's "Tom Jones," 6 vols., 1749, contain a page of errata not found in others, and that such copies have been called the first issue. The fact is that two distinct editions in six volumes, from two separate settings of type, appeared in 1749. They were set from the same fonts, but a comparison shows typographical variations on almost every page. Even A. W. Pollard, in his bibliographical note prefixed to the English Classics edition of "Tom Jones," 1904, has not realized that there were two six-volume editions. He says:

> The first edition, in six volumes, was followed the same year by a second in four, and in 1750, Millar published another edition, also in four volumes. In the second of these three editions over which he had control, the errors of the press, of which a list was prefixed to Volume I of the first, were duly corrected, but the text in other respects appears not to have been interfered with.

This statement is true of the second six-volume edition, which is without list of errata. With a single exception all the errors noted in the list prefixed to the first edition, were corrected in the text of the second. This exception is in Vol. IV, p. 193, line 11, "For *Crime* read *Shame*." In Vol. IV, p. 91, first edition, is a quotation from Othello, beginning "Who steals my Cash steals Trash," and in the errata is the entry "For *Cash* read *Gold*." The second six-volume edition reads "Who steals my Gold steals Trash." In later editions this was corrected to "Who steals my Purse steals Trash." In the first edition, the Latin motto on the title-page of Vol. I is followed by a period and a long dash. In the second edition, there is the dash only, no period. No differences can be detected in the title-pages of the other volumes. The following points will enable any one to determine the first or second edition. In Vol. I, the List of Contents ends on p. lxii, with errata on p. [lxiii], in the first edition; the contents extend over upon p. lxiii and there are no errata in the second edition. The catchword on p. 13 is "one" in the first edition, "be" in the second. In Vol. II, the catchword on p. 3 is "by" in the first edition, "tised" in the second. In Vol. III, the catchword on p. 1 is "Representations," in the first edition, "Repre-" in the second. In Vol. IV, the catchword on p. 1 is "Shake-" in the first edition, "the" in the second. In Vol. V, p. 54, line 4 ends "return" in the first edition, "Home" in the second. In Vol. VI, the catchword on p. 17 is "dle?" in the first edition, "Cradle" in the second. A thousand other differences might be enumerated. In the two copies of the first edition which we have examined and probably in all copies, several leaves are pasted on stubs. These leaves were reprinted, evidently to correct errors, but what these errors were may never be discovered. The leaves are a different setting of types from the corresponding leaves of the second edition. These leaves are:

Vol. I, pp. 17-20; p. 17 has signature mark † (a dagger).
Vol. II, pp. 7-10; p. 7 has signature mark ‡ (a double dagger); pp. 287, 288, with signature mark * (an asterisk).
Vol. III, pp. 147-152, with signature marks *2, *3, *4; pp. 233, 234; pp. 345, 346.
Vol. IV, pp. 1, 2.
Vol. V, pp. 279, 280.

In the *General Advertizer* for February 28, 1749, appeared the following notice:

> This day is published, in six vols., 12mo., The History of Tom Jones, A Foundling.—Mores hominum multorum vidit. By Henry Fielding, Esq.
> It being impossible to get sets bound fast enough to answer the demand for them, such Gentlemen and Ladies as please may have them served in Blue Paper and Boards, at the price of 16s. a set, of A. Millar, over against Catherine Street, in the Strand.

The copies issued "in Blue Paper and Boards" with uncut edges are now very scarce, one having sold at auction in 1902 for £96, while cut copies sell for £3 to £6.

The late Henry Stevens of Vermont (G. M.B. "Green Mountain Boy," he used to style himself on the title-pages of his books) took especial pride in his collections of De Bry, Hulsius, and Ptolemy. The set of De Bry's Voyages (perhaps the best in private hands) was acquired about 1890 by the late E. Dwight Church, who also, in 1896, purchased the Hulsius collection (probably the finest extant). Mr. Church was not interested in the Ptolemy collection, and in 1898 it was purchased from Henry N. Stevens (son of Henry Stevens) by Edward E. Ayer of Chicago. At the time an account of the collection was printed in an edition of twenty copies only. A second edition containing additional matter has just been published. Included is an account of important and inexplicable variations discovered in copies of the Ulm edition of 1482. The Stevens-Ayer set now includes sixty volumes, from the first printed edition, Vicenza, 1475, without maps, to the Amsterdam edition of 1730. The only editions known to Mr. Stevens which are lacking are: Bologna, 1462 (probably a misprint for 1482), and Cracow, 1512. The prefatory matter is of interest, but if full collations could have been added to the list of editions the volume would have been more useful. Notwithstanding the fact that Mr. Eames's bibliography of Ptolemy in "Sabin's Dictionary" is admirable and ideal (as is all his work), surely something could have been added by Mr. Stevens, and not every one is the owner of a set of Sabin.

Correspondence.

KNOWLEDGE OF MILTON IN EARLY NEW ENGLAND.

To the Editor of The Nation:

Sir: As a contribution to the subject broached by Mr. Charles Francis Adams in your issue of December 17, I beg to submit the following:

1722, Jan. 1, *New-England Courant*, p. 2: "'T is said a Noble Duke is about to erect a Monument in Westminster Abby, to the Memory of Milton, the Poet."

1722, July 2, *New-England Courant*, p. 1: "See how the lofty *Milton* sings of this in his own inimitable Strain." Then follow fifteen lines from "Paradise Lost," i, 34-48.

1722, July 2, *New-England Courant*, p. 2:

> We shall therefore only add that we are furnish'd with a large and valuable Collection of BOOKS; which may be of vast Advantage to us. . . . We shall at this time favour you with a small part of our Catalogue, *viz.* . . . Milton.

1723, Dec. 9, *New-England Courant*, p. 1: A writer quotes five lines from "Paradise Lost," viii, 54-58.

1723, "Catalogus Librorum Bibliothecæ Collegij Harvardini," pp. 52, 100: "*Miltoni* (Joan.) Defensio pro populo Anglicano cont. Salmasium. *Lond.* 1651. . . . *Milton's* (Joh.) Poetical Works Vol. 1. Vol. 2. *Lond.* 1720." .. ..

1727, Aug. 14, *New-England Weekly Journal*, p. 1: A writer quotes four lines from "Paradise Lost," x, 1073-1076, and remarks, "The Clouds hung round, as *Milton* expresses it, like a dark Ceiling over the Land."

1727, Aug. 21, *New-England Weekly Journal*, pp. 1, 2: "Verses Written in Milton's Paradise Lost,"; signed "L." This poem in blank verse was by the Rev. Mather Byles and was reprinted in his "Poems on Several Occasions," 1744, pp. 25-34.

1727, Oct. 9, *New-England Weekly Journal*, p. 1: A long poem signed "T.," addressed "To a Gentleman on the Sight of some of his Poems," speaks of "*Milton's* force and *Dryden's* smoothness" and contains also these lines:

> And now, my Muse, attempt one labour more,
> Let *Milton's* fame resound from shore to shore:
> *Milton* who in his works immortal lives,
> And in the deathless praise your Poem gives.

1744, February, *American Magazine* (Boston), i, 260: "An Epistle from Cambridge" contains the line, "Nor tow'ring *Milton's* lofty flights." Whether the Cambridge referred to was the one in England or the one in New England, is uncertain.

1744, April, *American Magazine*, i, 341: "The Art of Preaching, in Imitation of Horace's Art of Poetry" contains the line "Prink *Milton's* true Sublime, with *Swift's*

true Wit." Probably taken from an English source.

1745, June, *American Magazine*, ii, 239-244: "An Account of the Life of Mr. John Milton." Presumably copied from an English source.

1766, April 7, Boston *Gazette*, p. 1: "Harvardinum Restauratum," written by a recent graduate of Harvard, contains the line, "Or British Milton much surpassing both!"

1766, May 23, Rev. Jonathan Mayhew, "The Snare Broken," p. 35:

Having been initiated, in youth, in the doctrines of civil liberty, as they were taught by such men as Plato, Demostbenes, Cicero, and other renowned persons among the ancients; and such as Sidney and Milton, Locke and Hoadley, among the moderns; I liked them; they seemed rational.

1767, Dec. 10, Massachusetts Historical Collections, Fourth Series, IV, 412, 413: The Rev. Andrew Eliot makes some interesting remarks on Milton's prose works.

1773, "Catalogus Librorum in Bibliotheca Cantabrigiensi Selectus," p. 18: "Milton (John) all his Works."

When Phillis Wheatley was in London in July, 1773, she was presented by Brook Watson with a copy of the 1770 Glasgow folio edition of "Paradise Lost," which is now in the Harvard College Library.

Late in life, James Otis (Tudor's "Life," p. 17), declared to a young man:

If you want real poetry, read Shakespeare, Milton, Dryden, and Pope, and throw all the rest in the fire; these are all that are worth reading.

The above notes refer to Massachusetts only. On November 20, 1728, Franklin, who had left Boston only a few years before, drew up his "Articles of Belief and Acts of Religion," and there demanded the singing of Milton's "Hymn to the Creator." There are other interesting allusions to Milton in Franklin's writings. The "Catalogue of the most valuable Books in the Library of Yale College," 1755, listed "Paradise Lost" and "Paradise Regained." (I have not seen the catalogue printed in 1743.). The late M. C. Tyler noted allusions to Milton by William Livingston in 1747 at Princeton, and by John Trumbull in 1770 at Yale. Early blank verse in America is a sure indication of the influence of Milton. Mather Byles's poem noted above may be an early instance, but certainly is not the earliest, for in 1713 Richard Steere published "The Daniel Catcher. The Life of the Prophet Daniel: in a Poem. To which is Added, Earth's Felicites, Heaven's Allowances, A Blank Poem. With Several Other Poems." This volume, perhaps printed in New York, was advertised for sale in the Boston *News-Letter* of August 24, 1713, p. 2. Steere was born in England in 1643, came to Boston in 1684, immediately published there two poems in rhyme, soon went to New London, and later to Southold, Long Island. The "Blank Poem" fills pp. 55-73 of the volume.

These notes prove that Milton was known in Boston in 1722 and that at least some of his works were then here, and indirectly show his influence in 1713. The late Mellen Chamberlain said in 1887 that "before 1700, there was not in Massachusetts, so far as is known, a copy of Shakespeare's or of Milton's poems"; and in his article on "Early Private Libraries in New England," read before the American Antiquarian Society in April, 1907, Dr. F. B. Dexter was unable to refute the statement. Nevertheless, when it is remembered that in 1643, Roger Williams may have met Milton; that in 1653, they did meet and read Dutch and other languages to one another; that when George Downing, a graduate of Harvard, went to Holland as Minister in 1657, he bore a letter of credence written by Milton; that Milton was on terms of more or less intimacy with Sir Henry Vane, Hugh Peters, the regicides Dixwell, Goffe, and Whalley, and others who had lived in New England—is it rash to conclude that the above references are belated and that Milton was known to New Englanders both as a political writer and as a poet before 1722?

It may be added that, as shown by the many inventories of Virginia libraries printed in the *William and Mary College Quarterly*, there was apparently no copy of "Paradise Lost" in Virginia until 1755 (VIII, 77), though "Shakespears Works" were in another library in 1718 (II, 250).

ALBERT MATTHEWS.

Boston, December 18.

A PARALLEL FROM LYLY.

To the Editor of The Nation:

Sir: John Lyly, the Euphuist, was not only a writer of good lyrics himself, but the cause of lyrics in other men. It has often been remarked that the fairy song in "The Merry Wives of Windsor" owes something to the fairy song in Lyly's "Endimion," and the lark song in "Cymbeline" much to the song of Tryco in "Alexander and Campaspe.' In reading "Love's Metamorphosis" the other day I came across a bit of dialogue that seems to contain the germ of a famous modern lyric, F. W. Bourdillon's "The Night has a Thousand Eyes." I quote the dialogue (Act iii, scene 1) and the song:

Silvanus. The whole heaven hath but one sun.
Niobe. But stars infinite.

. . . . . .

Silvanus. A woman hath but one heart.
Niobe. But a thousand thoughts.

The night has a thousand eyes,
  The day but one;
Yet the light of the bright world dies
  With the dying sun.
The mind has a thousand eyes,
  And the heart but one;
Yet the light of the whole life dies
  When love is done.

HOMER E. WOODBRIDGE.

Colorado Springs, December 12.

ANCESTRY OF CHARLES THE GREAT.

To the Editor of The Nation:

Sir: In his book on Paris Mr. Hilaire Belloc states that whatever admixture of blood might have come through his mother, Charles the Great was of "pure Latin stock" on his father's side. What grounds are there for this amazing assertion?

A. R. W.

New Bedford, Mass., December 17.

BACON VS. GOETHE.

To the Editor of The Nation:

Sir: In his "Adolescence" (Vol. II, p. 85), G. Stanley Hall ascribes to Bacon the sentiment, "Character is perfected in solitude and talent in society." President Hall does not, at this time, recall where the adage may be found; can some one else therefore locate it for me? I am especially interested in the line, since in the well-known passage in Goethe's "Tasso" (Act i, Scene 2), practically the opposite view is voiced: "Talent is nurtured in solitude; character is formed in the stormy billows of the world." Agreeing with Goethe, Lowell, too, in his "Among my Books," says: "Society is wholesome for the character."

C. H. IBERSHOFF.

Ithaca, N. Y., December 18.

A PICTURE OF HOMER.

To the Editor of The Nation:

Sir: In your editorial article "Science Correcting Science" in the *Nation* of December 10 (p. 567) you refer to a recent contribution of André Beaunier to *La Revue de Paris*, and speak of his recollection of a picture of Homer as showing "an old man in a long robe, carrying a lyre on his back, his right arm raised to heaven, his left on the shoulder of a boy who was his guide." I have a fine old engraving of what I presume to be the same picture, with the legend:

F. Girard Pinxt. Rapb. Urb. Massard. Sculp. 1816.
Dédié à Monsieur le Chevalier
Ennius Quirinus Visconti
Membre de l'Institut de France
Par son Dévoué Serviteur
Raphaël Urbain Massard.

In this the *left* arm is raised to heaven and the right is leaning on the shoulder of a boy. Which is right, and who reversed the position, and when?

AMASA M. EATON.

Providence, R. I., December 13.

[We have verified the reference to *La Revue de Paris*. The picture which M. Beaunier saw may have been a different one, or M. Baunier's memory may have played him false.—Ed. Nation.]

THE TARIFF ON SCIENTIFIC BOOKS.

To the Editor of The Nation:

Sir: In view of the effort of the American Free Art League to bring about, in connection with the proposed revision of the tariff, the removal of the duty on works of art, it seems appropriate and timely for the scholars of the country to petition also for the removal of duty on scientific works in English, published abroad. During the Christmas week, or shortly thereafter, a considerable number of the learned societies of this country—such as the American Historical Association, the American Economic Association, the American Institute of Archæology, the Society of Biblical Literature, the American Philological Association, the American Philosophical Association, the Modern Language Association, and the American Psychological Association, and the various associations for the natural sciences—will hold their annual sessions. The sentiment among scholars is, it is safe to say, unanimous that to impose a duty on scientific publications in *any* language is not only an unjust tax on scholars without any particular benefit to either the author or the publisher, but is a reflection on the attitude of our government towards scholarship itself. If all the bodies meeting at this season will pass a simple resolution expressive of their opinion on the subject and forward the same to the chairman of the Ways and Means

Committee in Washington, it will undoubtedly have some effect. All that is necessary is for some member of each association to make it his business to introduce a resolution such as is here suggested. As far as I can ascertain, the United States is the only civilized country which imposes a tax on scientific research, and some expression of opinion from our scholars is all the more desirable, because it is not unlikely that an effort will be made to reimpose a duty on books printed in foreign languages. There are mutterings in the air, and it is well to be prepared for a retrograde movement.

I have purposely referred only to scientific books published in the English language, because they are the only ones with which scholars, as such, are concerned, and while I, personally, believe that the duty on English fiction is also an injustice, there is no need for scientific bodies to raise this question.

MORRIS JASTROW, JR.

Philadelphia, December 19.

THE LATE WILLIAM MARTIN AIKEN.

TO THE EDITOR OF THE NATION:

SIR: I have been hoping day by day, since the sudden and unexpected death of William Martin Aiken (see the *Nation* of December 10, p. 587), to see from the pen of some one better qualified than myself some fitting notice of his two years of service as Supervising Architect to the Treasury Department, from 1895 to 1897. It was a brief service, so modestly and quietly rendered that the world at large took too little cognizance of its really strenuous quality and its lasting value. But those who knew the Supervising Architect's office and its work before Mr. Aiken became its head, know that in his unassuming, straightforward way he effected a fundamental reform which more than one predecessor had longed for but had failed to bring about, and which in large measure made it possible for his successor, the present distinguished incumbent, to attain the notable results which have distinguished his administration.

The Supervising Architect of the Treasury is charged with the designing and erection of all the post offices and Federal court-houses, as well as the mints, sub-treasuries, assay offices, and custom houses of the Treasury Department. He directs the largest architectural office in the world, and the volume of work it handles is enormous. When Mr. Aiken entered upon his duties it was the butt of professional satire by reason of its low standards of artistic taste and efficiency. Political pressure and favor interfered at every point with the honest and effective discharge of its complex and onerous duties, both within the office itself and in all its widely scattered outside work. Mr. Aiken took hold of his task with an apparently naïve, but really purposeful, assumption that honesty and straightforward business efficiency were, as a matter of course, the ruling principles to be observed and that Secretary Carlisle had called him to Washington to serve his country rather than his party. Draughtsmen and employees were expected and were compelled to earn their salaries. Contracts were honestly awarded and rigidly enforced, and every reasonable economy was practised. The selection of marbles and granites, limestones, and cements was not determined by the demands of quarry-owning Senators and Representatives, or the pressure of local "interests," but by considerations of quality and cost, as for any business corporation or private owner. To give the country the best buildings within his power, both as to design and construction, was his one undeviating aim.

Mr. Aiken was not a *great* designer, but his work displays refined taste and good judgment. He was a capable administrator, and the buildings he designed and built were creditable to the government and to him. But finer than they was the monument he erected in the reorganization of his office and its deliverance from the slough of inefficiency and political manipulation. When, after the election of McKinley, he resigned his office into the hands of his able successor, he delivered to him a piece of machinery not yet perfect, but reasonably efficient and wonderfully changed from its condition of two years previous; and I am sure no one better appreciates than Mr. Taylor the service he rendered the country in this work of reform. Such service represents one of the highest forms of patriotism. Nothing but a single-hearted devotion to his country's interests, and to the highest standards of his profession under the approval of a clear conscience, could have sustained him in the struggle against intrenched and traditional abuses and the pressure of political influence in both high and low places. There was no gallery to play to for its applause, and Mr. Aiken's modesty would have shrunk from the pursuit of such applause. Quietly, cleanly, efficiently, he did his duty as he saw it, fought his fight, and left the field an unheralded victor.

With equal fidelity, though with far less opportunity for large achievement, Mr. Aiken served this city in 1902-04, under Mayor Low, as consulting architect to the borough president; and through all the remainder of his life, while engaged in private practice, he gave unstintedly of his time and strength to the service of the civic and professional organizations to which he belonged, and through them to the community. Not only the profession he loved, but the country at large, is his debtor for such varied and faithful service.

A. D. F. HAMLIN.

Columbia University, December 11.

Notes.

Mrs. Humphry Ward's first American novel, "Marriage à la Mode," opens in the January number of *McClure's*. What will that eminent psychologist of s ciety do without her dukes and duchesses and her leaders of Parliament?

W. H. Lowdermilk & Co. of Washington will publish, early in March, "Deck and Field," by Frank Warren Hackett, a collection of papers upon navy and army topics, opening with the two annual addresses delivered before the Naval War College by Mr. Hackett, while Assistant Secretary of the Navy.

Houghton Mifflin Company has brought out in the special Riverside Series a beautiful edition of Shelley's translation of "The Banquet of Plato." The press work is all that could be desired, but it would have been well to add a note giving a brief account of the circumstances under which the translation was made. Shelley's English is excellent, but does not convey the flowing character of the Greek as well as Jowett's. We observe that nothing has been done by punctuation or suggested emendation to straighten out the tangled sentence in the speech of Alcibiades, beginning "For Marsyas, and whoever" (p. 133 of this edition). The text follows Moxon's early edition; but surely Shelley never wrote the words as they stand.

A cheap and neat reprint of Jowett's translation of "The Republic of Plato" comes to us in two handy volumes from the Clarendon Press. The introduction, analysis, and text are unchanged from the standard third edition. It is, if ever book were, infinite riches in little room.

Volumes V and VI complete the Eversley edition of Tennyson which the Macmillan Company has been publishing. The contents, being chiefly the plays, give less opportunity than the earlier issues for interesting personal matter in the notes contributed by the poet and his son. A facsimile of the manuscript of "Crossing the Bar" forms a fitting close to the last volume. At a later date, we shall make this definitive edition of Tennyson the occasion for comments on his place as the representative Victorian poet.

In "Historical and Political Essays," by William Edward Hartpole Lecky (Longmans, Green & Co.), are collected several magazine articles and biographical sketches, nearly all of which had seen the light in the author's life. The fragmentary paper on "Formative Influences," which begins temptingly, breaks off abruptly with Lecky's giving up of his Cork living. The historian's grave and measured style marks all the volume.

Charles Scribner's Sons have a new edition, in one volume, of H. Noel Williams's "Madame de Pompadour" (See the *Nation* of November 20, 1902, p. 408). It is an interesting book, in which there is an attempt if not exactly to whitewash that much-abused lady, at least to present her faults and crimes in the most favorable light possible.

A book that went through twenty-two editions in the author's lifetime, the last being dated 1872, is something of a classic. Such was the fortune of Dean Ramsay's "Reminiscences of Scottish Life and Character," which A. C. McClurg now brings forward in an excellent reprint, with sixteen illustrations in color from water-color drawings by H. W. Kerr. The pictures, inset on dark cardboard, go well with the Dean's anecdotes and clever character sketches.

Good editions of Richard Jefferies's "The Open Air," with illustrations in color by Ruth Dollman, and of "The Life of the Fields," with illustrations by Maud U. Clarke, come from J. B. Lippincott. The pictures are agreeable, but for those who care for the brave style of Jefferies it will be more important to know that the page is well printed and the binding plain and suitable.

A singularly diversified and breezy career is described in the "Life of Bishop

McCabe" (F. H. Revell Co.), by Bishop F. M. Bristol. The most interesting part relates to his civil war experiences as chaplain of the One Hundred and Twenty-second Ohio Regiment and delegate of the Christian Commission. Captured at Winchester, he was confined for three months in Libby Prison, the "bright side of life in it" being the subject of a famous lecture of his which is given in full. Gifted with a magnificent voice, he sang with great effect the "Battle Hymn of the Republic" on one occasion in the National House of Representatives. President Lincoln was present and asked for its repetition. Later he was secretary of the Church Extension Society and bishop of the Methodist Church. An idea of his activity in this office may be gained from the fact that during a single year he labored in 100 towns and cities in 27 different States. He died in 1906 aged seventy. The biography is full of anecdotes and interesting incidents. The illustrations are chiefly portraits.

As a companion to his "Devonshire Characters," the Rev. S. Baring-Gould, most prolific of antiquarians, has published a book of "Cornish Characters and Strange Events" (John Lane Co.). In a series of short chapters a long line of worthies and eccentrics pass before us. Some of these were closely connected with Cornwall all their lives, like the John Carter who was called King of Prussia, and for many years ruled the smugglers of Prussia Cove; others left their land for court and city, like Sir Thomas Killigrew, the King's Jester whom Pepys saw on the vessel bringing back Charles II, "a merry droll, but a gentleman of great esteem with the King," and, he might have added, a lewd and lame poet. Some of the characters, such as Hugh Peters, the regicide, Mr. Baring-Gould treats at considerable length; others, such as John Coke, are summed up in two or three paragraphs. As a whole, it cannot be said that the book gives the reader a strong impression of the imaginative character of the people and the land. Far more of that is to be obtained from some of Mr. Baring-Gould's other books, notably his biography of R. S. Hawker, or, better yet, from C. E. Byles's life of that same eccentric, superstitious vicar of Morwenstow.

In the preface to his "Ancient Tales and Folklore of Japan" (The Macmillan Co.) R. G. Smith states that the stories are transcribed from voluminous illustrated diaries which he has kept for some twenty years of travel and sport in many lands. More particularly he has drawn from the record of the last nine years, during which he has been in Japan collecting subjects of natural history for the British Museum. His pursuits have brought him into contact with all sorts of people—the fisher, the farmer, the priest, the doctor—and from these he has gathered and set down a wealth of folklore and legend. The substance of the stories is like that which Lafcadio Hearn drew from old books. Mr. Smith writes them down in a straightforward manner, without, indeed, any of the ghostly art which makes the work of Hearn so unique, but with sufficient honest skill to keep the curiosity awake through a good many pages. It is a book to read at intervals, and not straight through. The illustrations, reproduced in color, were worked up by Mr. Mo-No-Yuki from Mr. Smith's sketches, and present at times a curious mixture of Eastern and Western taste. They vary greatly also in execution, and as a body are more interesting than correct. Altogether, the book can be recommended as one of the most attractive recent works of which Japan has been the theme.

The schism in the Babist ranks on the question of headship has been described by Gobineau in "Les Religions, etc.," and particularly by E. G. Browne, in his books on the Babist movement. The founder of the movement, Ali Mohammed, announced himself as being merely the door (*bab*) to the divine mysteries, the forerunner of him whom God should manifest. On the death of the Bab in 1850, Subh-i-Ezel, the highest in rank of his followers, was recognized as chief of the sect; but in 1866 another follower, Baha-ad-din, professing to show the "signs" indicated by the Bab, asserted his right to the position, and to him the suffrages of the majority of the Babist body were given. He finally found a home in Acco (Acre) in Palestine, where he died in 1892, leaving to his son, Abdu'l-Baha, the task of carrying on his work. Subh-i-Ezel's teaching has been described by Browne, and, now, under the title "Some Answered Questions" (J. B. Lippincott), Laura Clifford Barney reports the substance of interviews held by her with Abdu'l-Baha in Acco in 1904-1906. As he spoke in Persian, and she understood the language at first not at all and later only a little, it is not certain that she has reported him with perfect exactness in all points, but she has doubtless given the gist of his statements. The Persian text of the answers is to appear shortly. Subh-i-Ezel is reported to have confined himself strictly to the teachings of the Bab; Baha-ad-din, as interpreted by his son, aimed more definitely at the establishment of a universal religion—he transformed Babism into Bahaism. While loyal to the Bab, he presents himself as the final Manifestation of God, and the infallible revealer of truth. His utterances, as given in the present volume, exhibit a mixture of ethical purity, religious breadth, and child-like credulity. All the personages, events, customs, and doctrines of Judaism, Christianity, and Islam he accepts and interprets from a spiritual point of view. Abraham, Moses, Christ, Mohammed, and the Bab he recognizes as his inspired forerunners, each adding his quota to the mass of truth, each great in proportion as he manifests the perfections of God. Every doctrine is good so far as it embodies a spiritual conception; thus, in the Christian doctrine of the Trinity, Christ is the mirror of divine Reality, and the Holy Spirit is the Bounty of God, which becomes visible in the Reality of Christ. There is one religion in the world—all strifes, religious and political, are to cease with the triumph of Bahaism. A great variety of subjects is discussed in the volume: Darwinism, immortality, fate and free-will, the existence of evil, reincarnation, pantheism, and others, all treated shrewdly, though sometimes crudely. On the other hand, proofs of the divine mission of Baha-ad-din and other prophets are drawn by elaborate arithmetical calculations from the numbers given in the books of Daniel and the New Testament Apocalypse. Apart from scientific crudeness and the assumption of infallibility, Bahaism, as exhibited in this volume, is ethically broad and noble, and cannot fail to be a valuable factor in the life of those persons (numerous in Asia, Europe, and America) who accept it.

A contribution of prime importance to our scanty knowledge of English colonial administration in the seventeenth century is made by Prof. Charles M. Andrews in his "British Committees, Commissions, and Councils of Trade and Plantations, 1622-1675" (Baltimore: The Johns Hopkins Press). From a first-hand study of material in the British archives, Professor Andrews is able to trace with some detail the history of the various bodies upon which was devolved, from time to time, the supervision of plantation trade, and to point out the steady, though irregular, development of a colonial policy. So little attention has yet been paid to the legal and administrative sides of American colonial history that much of the material in this pamphlet will be practically new, but we have space only to note a few of the points at which Professor Andrews's research corrects hitherto accepted statements. For example, the evidence goes to show that the importance of the first separate commission for plantation affairs, that created by Charles I in 1634 under the headship of Laud, has been much overrated, and that the commission did not in fact accomplish much. On the other hand, the Commission, or Council, of Trade of 1650, with its "statesmanlike and comprehensive instructions" (p. 24), has been unaccountably neglected. Some idea of its activity may be gathered from the fact that by November, 1651, it had made no less than seven reports to the Council of State and the same number to Parliament, had ready for submission opinions on six subjects, and had under debate eight other questions (pp. 25, 26). Of Cromwell's interest in colonial affairs something has been written, but Professor Andrews, though recognizing his activity, concludes that "there is nothing to show that Cromwell himself ever rose to a statesmanlike conception of colonial control and administration" (p. 37), and that the management of colonial affairs during the interregnum was "without unity or simplicity" (p. 48). Chapter iii, dealing with the proposals of the London merchants, particularly Noell and Povey, on the eve of the Restoration, is especially informing for the light which it sheds on the commercial interests behind official plans, and on the influences which affected Clarendon's policy. With the fall of Clarendon, in 1667, came further changes in organization and widespread demoralization in trade, although a sincere desire to benefit the kingdom seems to have been a controlling motive under Charles II quite as often as politics or extravagance. Appendices give the texts of important instructions, and a useful "Heads of Business of Councils," 1670-1674.

"The American Executive and Executive Methods," by President John H. Finley and John F. Sanderson (The Century Company), completes the American State Series, edited by Prof. W. W. Willoughby of Johns Hopkins. The eight volumes, covering the entire organization of public authority in our system of government, form a useful set of text-books. The present work gives a comprehensive view of the legal powers of the chief executive in State and nation,

with citation of important judicial decisions. The broad distinction is noted that exists between the State Governor and the President in actual power and influence, owing to the disintegration of executive power in the State, but the vast importance of the consequences does not receive due appreciation. In the sections relating to the national executive one could desire that there should be a fuller consideration of what might be called the prerogative powers of the office—those deriving not from positive law, but from the incumbent's own conception of duty in fulfilment of his paramount obligation to "preserve, protect, and defend the Constitution of the United States." At the outset the authors lay down a proposition which negatives the idea that there can be anything in the nature of prerogative: "The American executive power has been always a constitutional power, in the sense of a written power." But elsewhere activities of executive power are mentioned which cannot be traced to written power. For instance, it is remarked (p. 189):

> In the conduct of foreign affairs the executive power is guided, restrained, and explained by the law of nations, and in the conduct of military operations it is interpreted by the laws of war.

It is further averred (p. 266) that "the Constitution does not specify the powers which he may rightfully exercise in his character as commander-in-chief, nor are they defined by legislation." Not only does his authority extend beyond written power, but it is noted that it overflows written power expressly denied him. Thus Congress alone has written power to declare war, and yet "the President may establish the legal status of war, without such declaration, by using defensively those means and measures which, under the law of nations, are employed in lawful war" (p. 292). On the general subject of the distribution of authority, the work says (p. 49):

> The duty of the Legislature is to prescribe the rule of action for the State, that of the judiciary to interpret that rule or to expound that law, and that of the executive to see that the law is faithfully administered.

In view of the admissions noted in the foregoing, it is manifest that this statement of constitutional doctrine does not agree with existing facts and circumstances. The narrow, legalistic view taken in this work precludes just consideration of the development of the Presidency as an organ of political force, and of the transformations it has experienced in this respect. The message of President Polk, December 5, 1848, in which he declared the Presidency to be a representative institution—the only one representative of the nation as a whole—is a landmark of our constitutional development, the significance of which is yet to receive proper recognition.

"All this Herbert Spencer has clearly revealed," remarks Andrew Carnegie, in sketching a process by which there "came life from the ooze of the sea," culminating in the development of the human race and the spread of civilization. Basking in the light of Spencerian revelation, Mr. Carnegie is able to give us positive assurance that all is for the best in this best of all possible worlds:

> We of to-day have become more civilized, more peaceable; the arts of peace, not not those of war, our occupation. We have reached the industrial age with its problems.

These problems form the theme of Mr. Carnegie's "Problems of To-day" (Doubleday, Page & Co.), mainly devoted to a consideration of Socialism in its various phases. He contends that Individualism can beat Socialism at its own game, instancing old-age pensions, New Zealand land legislation, government ownership of railways, and municipalization of public utilities as triumphs of Individualism. American public policy is cited as an illustrious example: "In America there are no duties of moment, except such as bear upon the rich, who alone use imported articles." In this statement there should be some balm for the "standpatters" whom lately he wounded by declarations that the tariff would bear trimming. The final essay deals with "Railway Rebates," a subject on which Mr. Carnegie is qualified to speak with authority, without the aid of Spencerian revelation. But here, again, his fondness for gross optimistic assertion precludes anything like true discussion. In view of actual conditions the complacency seems astonishing that enables him to say:

> The ease and rapidity with which the commission was established, which has already abolished demoralizing rebates and is rapidly giving to corporate investments the security they possess in other lands by bringing them under supervision, is a great triumph for our governmental system.

Mr. Carnegie's habit of cutting discussion short by oracular utterance gives to his style a peculiar quality, that can only be described as pudgy.

Somewhat as Goethe and Schiller, in stimulating rivalry, entertained and inspired the little Duchy of Weimar and led on the rest of literary Germany, so Gerhart Hauptmann and Sudermann still contend for the mastery. A few weeks ago Sudermann surprised his admirers by a return to fiction; and now Hauptmann, whose last work, "Kaiser Karls Geisel," was a play, furnishes a still greater surprise in a compendious volume, beautifully printed, giving his impressions of springtime in Greece, "Griechischer Frühling" (imported by Lemcke & Buechner). The book is not of travel, in the conventional sense; it is a series of highly-polished paragraphs, as if torn from the leaves of a poet's diary. Hauptmann roams among gods and goddesses; though he cannot get away entirely from screaming, fighting hawkers and exorbitant guides, these but serve as natural background for a scene in the foreground of which still move the ancient deities. All along the sea-route to Greece Hauptmann finds endless stuff of poetry, recalling the "clever liar" of the Odyssey, and concluding that, when he is seasick, a god is but taking revenge upon him. Rainbows encircle sea and land; the roar of the ocean fills his soul. He goes into ecstasy over Corfu, wandering here and there until darkness prevents his visiting the monument to Heine. Everywhere the spring encompasses him: the sweet aroma of orange-thickets, pomegranates, and raspberries rises from the hillsides like incense. Fair skies become overcast and drizzle; Hauptmann's thoughts turn to a crowd of young Athenians, and he wonders if Alcibiades may not be among them. In sacred but joyful intercourse with both gods and those of old who worshipped them, Hauptmann wanders from corner to corner of classic Greece, lost in wonder at the ruins; he climbs the sides of theatres, descends into the caverns of temples, and tosses a wild-flower into the dark well; and at length, all too reluctantly, of course, bids adieu to Athens, "the light, the heart, the head, the breathing breast, the blossom of Greece."

Heine's complete works, with introduction and commentary, are published in four volumes by the Deutsche Verlagshaus Bong & Co., Stuttgart. Of the five editors engaged upon the task, Veit Valentin is an author who looks back upon forty years of activity as writer on various philological and literary subjects, and editor of numerous school classics.

The tragedy of Heinrich von Kleist's life has never ceased to engage the attention of students. One of the latest contributions to the subject is Hanna Hellmann's "Heinrich von Kleist: Das Problem seines Lebens und seiner Dichtung" (Heidelberg: Carl Winter).

Aus der Gedankenwelt grosser Geister is the collective title of a series of books edited by Lothar Brieger-Wasservogel (Stuttgart: Robert Lutz). Each volume contains selections from the writings of some great thinker. The twelfth volume was devoted to Rousseau, the thirteenth presents Pascal.

Theodor Wolff is the author of a book which, in the variety of subjects treated and in the sprightly tone in which it is written, suggests the atmosphere of the city to which it is dedicated. The "Pariser Tagebuch" (Munich: Albert Langen), a collection of papers originally written for the *Berliner Tageblatt*, gives vivid impressions of figures and phases of French art and letters and intimate glimpses of life in Paris.

Dr. Heinrich Meisner, author of a history of the invention of printing and other historical works, and editor of the writings of Ernst Moritz Arndt, of posthumous poems by Eichendorff, and letters by Wilhelm von Humboldt, has published separately, under the title "Ernst Moritz Arndt: Sein Leben und sein Schaffen," the biography of Arndt which originally appeared as introduction to the works. (Imported by G. E. Stechert & Co.)

The *Harvard Gazette* announces that by bequest of the late Prof. Charles Eliot Norton, the College Library has received an interesting early portrait of Chaucer, painted in oil on an oak panel. An inscription on the back of the panel, formerly legible, but now too faint to read, states:

> This picture was presented by Miss Frances Lambert to Benjamin Dyke on the 6th of September, 1803, to perpetuate the memory of her late invaluable relation, Thomas Stokes, Esq., of Llanshaw Court, in the County of Gloucester, where it was preserved for more than three centuries, as appears from the inventory of pictures in the possession of that ancient and respectable family.

Nothing more is known of the origin or early history of the portrait, but it shows a close resemblance to the only known authentic portrait of Chaucer, the miniature in Occleve's "De regimine principum" (Harleian MS. 4866), written in 1411-12, and to a later full-length portrait in another British Museum manuscript (Additional MS.

5141). In recent years, it has been known as the Seddon portrait. It was bought, after Mr. Seddon's death, by Fairfax Murray, who later sold it to James Loeb. Mr. Loeb presented it to Professor Norton. Professor Norton bequeaths it to the library, with the request that it be inscribed as a memorial of two lovers of Chaucer, Francis James Child and James Russell Lowell.

The original manuscript of Cyrano de Bergerac's "Voyage à la lune" has been found in the Bibliothèque Royale of Munich According to this MS. the romance, which has heretofore been attributed to 1649-50, was written in 1641-3.

The Modern Language Association of America will hold its twenty-sixth annual meeting at Princeton, December 28-30. President Woodrow Wilson will give an address of welcome. The programme lists the following papers: "Chaucer's 'Legend of Meden,'" Robert K. Root, Princeton; 'An Unpublished Collection of Old French Fables," Murray P. Brush, Johns Hopkins; "Goethe's Homunculus: A Study in Faust Criticism," Karl D. Jessen, Bryn Mawr; "The Results of Mrs. Macdonald's Discoveries regarding Jean Jacques Rousseau," Albert Schinz, Bryn Mawr; "The Purport of Lyly's 'Endimion,'" Percy W. Long, Cambridge, Mass.; "Ælfric's Legend of St. Swithin," Gordon Hall Gerould, Princeton; "A Plea for the Study of Mediæval Latin," Frederick Morris Warren, Yale, president of the association; "The Poetry of Sully Prudhomme," E. P. Dargan, University of Virginia: "Milton and the Revival of the Sonnet," Raymond D. Havens, University of Rochester; "A Definition of 'Petrarchismo," John Milton Berdan, Yale; "'Chauvin' ('Chauvinisme'—'Calvin,' 'Cauvin'): Truth and Fiction in the Story of Its Origin," A. Marshall Elliott, Johns Hopkins; "Pössneck and 'Hermann und Dorothea'," Charles Julius Kullmer, Syracuse University; "French Poetry and English Readers," Brander Matthews, Columbia; "The Facts of Pierre Du Ryer's Life," H. Carrington Lancaster, Amherst; "The United States in European Literature," Camillo von Klenze; "The Beginnings of Byronism in Spain," Philip H. Churchman, Clarke College; "The Moor in Spanish Popular Poetry before 1600," William Wistar Comfort, Haverford; "'Amore e Monna Lagia e Guido ed Io': A New Interpretation of the Sonnet by Guido Cavalcanti," James E. Shaw, Johns Hopkins; "'Beowulf' and the 'Saga of Hrolf Kraki," William W. Lawrence, Columbia; "The First Book Printed in England and Its Source," Ernest F. Langley, Dartmouth; "The Influence of the Translation Technique of J. H. Voss on Goethe's Hexameter," Clarence W. Eastman, Amherst; "Fortune's Wheel in the 'Roman de la Rose'," Stanley L. Galpin, Amherst; "The Fabliau in English Literature," G. H. McKnight, Ohio State University; "Tennyson's 'Idylls of the King' as Epic and as Drama," Percy A. Hutchison, Harvard; "A Recently Discovered Fragment of an Old French Life of Julius Cæsar," Henry A. Todd, Columbia; "The Collaboration of Webster and Dekker," Frederick E. Pierce, West Haven, Conn.; "A Prospective Edition of the 'Chanson de Roland'," F. B. Luquiens, Yale. The following papers are to be read by title only: "Stress in 'The Wars of Alexander'," C. R. Baskervill, University of Texas; "On the Supposed Dramatic Character of the 'Ludi' in the Great Wardrobe Accounts of Edward III, 1345-1349," Arthur Beatty, University of Wisconsin; "Is a New Laokoön Needed?" Samuel P. Capen, Clark College; "Barthélemy du Chastel, Archdeacon of Avignon," John L. Gerig, Columbia; "The Influence of Salvator Rosa in English Literature of the Eighteenth Century," E. E. Hale, jr., Union College; "The Relation of Thought and Language," Theodore W. Hunt, Princeton; "The History of French Fable Manuscripts," George C. Keidel, Johns Hopkins; "The Fisher-King in the Grail Romances," William A. Nitze, University of California; "The Supernatural in American Literature," Arthur Hobson Quinn, University of Pennsylvania; "A Note on Marlowe's Dramatic Technique," Martin Sampson, Cornell: "Some Changes now Going on in English," C. Alphonso Smith, University of North Carolina; "English for Engineers," Wilbur Owen Sypherd, Delaware College. The American Dialect Society and the Concordance Society will meet at the same time and place.

The Prix Goncourt (5,000 fr.) has been awarded to Francis de Miomandre, subeditor of *L'Art et les artistes,* for the history of a "jeune littérateur marseillais." The Prix Vie-Heurcuse for 1908 goes to M. Estaunié, author of "La Vie secrète."

Orlando Jay Smith died Sunday night at Dobb's Ferry, N. Y., at the age of sixty-six. During the civil war he served in the army, rising from private to major. He then went into the newspaper business, and in 1882 founded the American Press Association, of which he remained president until his death. He published several books: "A Short View of Great Questions" (1899), "The Coming Democracy" (1900), "Eternalism" (1902), and "Balance" (1904).

Cardinal Victor Lucien Sulpice Lecot, archbishop of Bordeaux, died at Chambéry, France, on Sunday. He was born at Montescourt January 8, 1831. He was appointed bishop of Dijon in 1886 and archbishop of Bordeaux in 1890, and was created cardinal January 16, 1893. He was one of the most prominent figures in the question of the separation of church and state in France, and led the party of conciliation, maintaining that resistance would entail a religious war, which would be the worst of evils, in view of the indifference of the greater number of Catholics. He strongly condemned, however, the separation law in a pastoral letter, and later issued an appeal to the faithful not to join "false Catholics and bad priests" in the formation of associations to take over church property. His published works are: "L'Abbé Nollet, inventeur de l'électricité dans les nuages," and "Foi picarde."

Frau Ilse Frapan-Akunian has died at Geneva, at the age of fifty-six. Her stories of life in Hamburg, where she was born, brought her considerable reputation. Her works include: "Hamburger Novellen," "Zwischen Elbe und Alster," "Enge Welt," "Zu Wasser und zu Lande," "Die Betrogenen," "Arbeit," and "Die Ritter der Moral."

PROBLEMS OF EDUCATION.

The American College: A Criticism. By Abraham Flexner. New York: The Century Co. $1 net.

America at College: As Seen by a Scots Graduate. By Robert K. Risk. Glasgow: John Smith & Son. 3s. 6d. net.

If the parents of American college youth were all to read the severe indictment of our colleges in Mr. Flexner's volume, and to accept it at its face value, the average college might not find students enough next year to justify it in keeping its doors open. This, however, would hardly be the impression intended; doubtless, the reader will get nearer Mr. Flexner's true meaning by crediting him with the common though often dangerous device of seeking emphasis through exaggeration. With due allowance on this score, the destructive side of this book contains much to which college authorities may well devote serious attention.

There is only too much concrete evidence to justify the complaint that college students are lacking in spontaneous and disinterested intellectual activity; that they "are, and for the most part emerge, flighty, superficial, and immature, lacking, as a class, concentration, seriousness, and thoroughness." It is well to remember, however, that, consciously or unconsciously, we pass this judgment, not in comparison with what the same young man would probably be without college associations and training at all, but with an ideal which we have in mind as the legitimate fruit of college opportunities. Flightiness, lack of spontaneous and disinterested intellectual activity, immaturity, and superficiality, are unfortunately still a large part of the mental inheritance of us all. Many of the world's really great men have carried a varied assortment of these qualities through life, and we have hardly reached the point where we can fairly expect the college to divest the average boy entirely of this burden. Still, that is just what education should aim at, and Mr. Flexner's over-coloring of the picture may well be excused if it shall rouse college authorities out of a lazy satisfaction with inadequate results.

It is doubtless possible to overestimate the significance of such statistics as are often circulated to prove the high average of success in after life on the part of college men as compared with others. Mr. Flexner demonstrates by his own handling of the subject that it is just as possible to underrate this evidence. The fact that college-educated men have been better able, on the average, than others to attain what they regard as reasonable success in various walks of life does, we hold, demonstrate a high value in this education, despite its unquestionable shortcomings. It is easy to say that the col-

lege deserves no credit, since it receives the ablest and most energetic youth to work upon, but most college teachers would qualify that assertion. Is there any college which has not its large element of students who display a distressingly low level of mental ability? Does any college teacher fail to be troubled with a goodly number in whom energy is wofully lacking? How many colleges are without a noticeable contingent of wealthy idlers who see no necessity for energetic effort on their own part? We grant that our colleges show shameful slackness, and even cowardice, in not setting higher standards, and, even at the expense of tuition fees, getting rid of the idle and the vicious. Nevertheless, the college, as it has been and is, must still be credited with making a great many useful and successful citizens out of extremely raw and unpromising material.

We go hand-in-hand with Mr. Flexner first in admitting that necessity of extending the field of college study, which brought in the principle of election, and then in the opinion that the colleges have as yet failed to work out such a practical application of the principle as will secure to students in general all the advantages hoped for. Too many students fail to gravitate toward some department for which they possess natural aptitude and to throw themselves enthusiastically and hence successfully into that work; nor do they attach themselves to individual teachers whose personality is such as to take a powerful hold on their respect and affection and call out their most vigorous efforts. Again, too many students never rise to a fitting sense of responsibility and elect a fairly varied and broadening and yet inherently consistent course. For this defect of the elective system, Mr. Flexner assigns three reasons: First, that the preparatory routine demanded by the college suppresses just that power of wise choice, which the college assumes that it will develop; second, the chaotic condition of the college curriculum; and third, the fact that special research has appropriated so large a share of the college energies and facilities. To meet this last difficulty, he calls for "a vigorous reassertion of the priority of the college as such." The proper methods for research and the needs of the undergraduate do not coincide. "The necessary pre-condition to highly specialized research is thorough preliminary training in past achievement and a more than superficial knowledge of correlated branches." The freshman, of course, enters college without this equipment, and the "research work" into which he is forced during his undergraduate years is consequently a farce.

When Mr. Flexner comes to deal with the relation of the preparatory school to the college, however, there is more room for question. His demand, in brief, is that the college shall take its controlling hand off the secondary school. The range of choice among different preparatory subjects permitted of late years by some colleges, does not content him. Even in these cases, the requirements predetermine the methods of the secondary teacher. He would shove the elective principle back bodily into the secondary school, and admit no such examinations by college authorities, or control of any other kind, as would limit the judgment of the secondary teacher in matters concerning the content of the course, or the methods of instruction. Behind this radical demand lies his belief that the secondary teacher has the pupil just at that plastic period when his natural aptitudes may most easily be discovered and his energies enthusiastically engaged in the most effective channels. The secondary period, he thinks, is far more favorable than the college for the "free exploration" of the boy. After the preparatory school, thus left to its own insight, "has actually laid bare the individual, has started up vital and characteristic activities," the college will have something solid to build upon. The youth will enter with an adequate foundation for an intelligent choice of his status in life; and with this determined at the outset, "the college must then organize for him the intermediate steps to his chosen end." Of course, this carries with it the view that in the college "imminent vocational or professional necessities should largely determine both the content of the curriculum and the form of the instruction." The curriculum would thus naturally be organized into groups, the contents of each group being determined by the "status" towards which it aims. But this plan would easily lend itself to the promotion of very narrow views of the fundamental purpose of education. Too early a realization of the "imminent vocational or professional necessity" may readily defeat its own end, to say nothing of that broader view of education, which would use the college years for laying a mental and moral foundation, upon which any life status whatever might rest. The present college does not insure this, but we have hardly reached the point where it must be dropped as an impossible ideal.

"America at College" is a fairly entertaining but very superficial account of "some dozen representative universities and colleges in the United States." The author, a Scottish journalist, prepared the matter originally as a series of articles for the Glasgow *Herald;* and they have the excellences and defects of journalism. They are light and readable, but they treat chiefly of externals, and offer no specially profound or searching generalizations. Mr. Risk describes Harvard, Yale, Cornell, the University of Michigan, Hobart, the University of Chicago, Johns Hopkins, Bryn Mawr, Wellesley, Columbia, the College of the City of New York, and Princeton. He then adds chapters on "The Social Side," "Staff and Student," and "Some General Conclusions." His trip was evidently too hasty to allow a thorough examination of the work of any of these institutions, but he saw some of the evils of which Mr. Flexner complains. He questions the efficiency of the unrestricted elective system; he complains of the low standards of scholarship; he deplores the undue emphasis on intercollegiate athletics. The "organized applause" impressed him "not only as a novelty, but as something grotesque and infantile." Perhaps we can best characterize the book by quoting the closing sentences:

> The American universities fulfil one part of their work, the forming of character with notable success. When they are some centuries older, they will produce scholars as well as engineers, doctors, lawyers, agriculturalists, and administrators in politics and commerce. In the meantime, the universities are training the kind of man required by a nation whose material resources have only begun to be developed. It is a great country, America. In university matters, as in social and political affairs, it does not know where it is going; but it is determined to get there.

The Teacher. By George Herbert Palmer and Alice Freeman Palmer. Boston: Houghton Mifflin Co. $1.50 net.

Personality in Education. By James P. Conover. New York: Moffat, Yard & Co. $1.25 net.

The supreme importance in education of the teacher is the central idea of Mr. Conover's book and of the opening essay of Mr. and Mrs. Palmer's. The latter, however, would have been better entitled "Essays on Educational Matters," for it is really a heterogeneous collection of writings, differing much in subject, timeliness, and intrinsic value. Of its three groups, the second, "Harvard Papers," consisting mainly of articles written in the '80s in defence of the elective system, seems oddly out of date—not because that system bas been established past all need of defence, but because the criticisms now based upon experience of its twenty years of triumph must be met with other arguments and evidence than served to refute the fears and guesses of its original opponents. Tucked into this group, by the way, we find a sketch of the eccentric and picturesque Prof. E. A. Sophocles, a portrait altogether delightful in itself, but quite out of place in this series of arguments and expositions. The four short papers on women's education, by Mrs. Palmer, with which the book closes, are also lacking in any vivid present interest, although there is something pleasant in the friendly,

hopeful, rather uncritical spirit in which they are written.

The really valuable essays in this book are those of the first group, especially "The Ideal Teacher," "Self-Cultivation in English," and "The Glory of the Imperfect." In these Mr. Palmer's rare mixture of practicality and idealism, his humor, his faith in human nature, and his love of life inspire scores of helpful and memorable passages. "The Ideal Teacher," in particular, should be published by itself and placed in the hands of every man and woman engaged in "the impartation of knowledge"—which, as Mr. Palmer usefully reminds us, is an entirely different matter from the acquisition of it. As he says:

> While no doubt it is well for a teacher to be a fair scholar—I have known several such—that is not the main thing. What constitutes a teacher is the passion to make scholars.

It is interesting, in view of the reaction so perceptible in the educational world against specialization and the elective system, to see how heartily and undoubtingly this veteran believes in both. Partly, this faith has been the result of experience—he was a slow convert, he tells us; partly, it seems to spring from his hopeful, democratic spirit. It is this spirit which enables him to write so sympathetically, albeit with a twinkle:

> Any man who loves knowledge and his native land must be glad at heart when he visits a summer assembly of Chautauqua; there listens to the Orator's Recognition Address; attends the swiftly successive Round Tables upon Milton, Temperance, Geology, the American Constitution, the Relations of Science and Religion, and the Doctrine of Rent; perhaps assists at the Cooking School, the Prayer Meeting, the Concert, and the Gymnastic Drill; or wanders under the trees among the piazzaed cottages and sees the Hall of Philosophy and the wooden Doric Temple shining on their little eminences; and, best of all, perceives in what throngs have gathered here the butcher, the baker, and the candlestick-maker—a throng themselves, their wives and daughters a throng—all heated in body, but none the less aglow for learning and a good time. . . . To find a popular movement so composite and aspiring, we must go back to the mediæval Crusades or the Greek Mysteries. In these alone do we observe anything so ideal, so bizarre, so expressive of the combined intellectual and religious hopes of a people.

If Mr. Palmer's ideas, however true and helpful, are not remarkably original or profound, they borrow some distinction from the medium through which they are put forth, a style of limpidity, suavity, and familiar elegance.

In comparison with it Mr. Conover's well-meant sentences suffer perhaps unfairly. Still, it remains true that in manner as well as matter Mr. Conover is inferior not only to Mr. Palmer, but, as he would be the first to admit, to the three writers and teachers from whom he quotes so modestly and generously—President Hyde, Dean Briggs, and Thring of Uppingham. The real value of his book, indeed, lies chiefly in these full and admirable selections, chosen and arranged to bring out and fortify the author's thesis:

> After all improvements in books, methods, and appliances, *the teacher* is the one absolute requisite, and all true advance must go *through him.*

Mr. Conover's book is practical, concentrated, professional. Founded on long experience in St. Paul's School at Concord, N. H., it excels where its scope is narrowest and where the earnest, conscientious labors of the teacher enable him to offer useful suggestions to those in similar situations. On the vexed question of athletics Mr. Conover speaks with no uncertain sound:

> What can we expect in finance and social rivalry of those who have imbibed for many years the spirit that now commonly pervades the playgrounds of our schools and colleges?

This spirit, he finds, is that of "undue rivalry," which "has not only subverted the whole idea of play, but . . . has tended to breed in our stock an inordinate and impatient desire for immediate success":

> . . . The boy is in the way of being trained into an utterly false standard of life. His eye is fixed on all the little trumpery prizes by the way; he is ever racing with somebody; he is worn out with the competition, and loses sight of the great prize: to find that place among his fellows which is *his* and which he can fill better than any other man.

Mr. Conover's remedy is that the school shall "be the absolute arbiter of the games to be played and . . . see to it that its boys play, and not solely or principally train a team to down some other team. Men at college will play what they have learned at school. Now the sequence is reversed. Boys at school try to play what graduates arrange for college men to perform." On religious education the author's views are liberal, but are naturally much colored, especially in expression, by the atmosphere of a "Church" school. It seems a little curious that, while stress is laid on the desirability of careful instruction in the Prayer-Book, Bible-study is mentioned but once, and then to be deprecated.

CURRENT FICTION.

The Wind in the Willows. By Kenneth Grahame. New York: Charles Scribner's Sons.

It is difficult to describe the impression made by this beautifully written book, or to determine whether it was intended for children, for grown people, or for grown-up children—perhaps it was meant for all. It is full of dewy nature, breathes the open air of field, winding river, and forest. The pipes of Pan are in it, the lure of far blue distances, strange whiffs from gypsy-land. There is wood magic and melody enough in it—apart from the sprinkled songs—to set up a minor poet for life. Yet it tantalizingly fails in its total effect. It goes at times as far over the heads of children as at others it descends beneath the heads of adults. It seems as if the author had set out to write a kind of poetical journal of a group of high-spirited collegians in their *Wanderjahr.* When he had done, it seems, in an odd whim he blotted out the names of human characters and wrote in their stead Water Rat, Toad, Mole, Badger, and Otter. Aside from their names, there is nothing to connect their adventures with the lower animal world. The result is neither a naïve animal story nor evenly sustained allegory—it is a sort of puzzling medley with many happy lucid intervals and promise of better things.

The Shadow World. By Hamlin Garland. New York: Harper & Bros.

Although certain fictitious names of persons and places are used in this book, it is not so much a work of fiction as a record of "the most marvellous phenomena which have come under the author's observation during the last sixteen or seventeen years." He has based his narrative, moreover, not upon general recollection, but upon notes made at sittings, and reports of his to the American Psychical Society, of which he was at one time a director. He also rehearses many of the phenomena vouched for by Crookes, Wallace, Zöllner, Botazzi, and others. But the chief interest of the book for most readers will lie in the record of Mr. Garland's own experience. What is the upshot for him of his commerce with mediums or "psychics"? It has been his determination from the outset "to strip away all romance and all superstitious religious ideas from this subject," and to "insist on the normal character of these phenomena." There is nothing supernatural about them; the problem is simply to find out what unknown law of nature they embody. From this point of view the phenomenon of "telekinesis" is the important one. The remarkable cases of impersonation, or apparent reincarnation of departed souls, he dismisses as of little interest to the scientific investigator. "You are still in the tattered fringes of spiritism, even when you have seen all that impersonation can show you." That material objects may be actually moved by forces other than those which we call physical is the first alleged fact which he sets out to test. In most cases the tests were, to his mind, satisfactorily met: the usual somewhat absurd things happened. The

author is convinced that tables climbed about the room, accordeons were played by unseen hands, books and other small objects were mysteriously transported, "messages" were received, in writing, by raps, and by whispers. These utterances were commonly trivial in themselves, as were the feats of lifting and moving. Mr. Garland believed that what was involved was "not the mystery of the discarnate soul, but the mystery of the X-ray." The difficulty is that such a work as this can hardly be criticised as a scientific discussion. On the other hand, it has small claim to be read as fiction. Yet its form as such will no doubt result in putting the more recent scientific investigations in "the shadow world" before a great many people who would dodge the reports of the psychical societies.

The Elusive Pimpernel. By Baroness Orczy. New York: Dodd, Mead & Co.

There yet remains to be written a book, "How to 'Novelize' a Short Story." Whoever undertakes the work should begin with Baroness Orczy, whose wealth of expansive devices commands admiration. "The Elusive Pimpernel," a daring Englishman, moves in the hazardous society of Robespierre and his guillotine; he gets into terrible scrapes and out of them. One of these is the "plot" of this book. Told in forty-four pages, it might have made as lively romance as one could wish for; there are fair ladies, dark intrigues, and surprises enough for that space. But when they fill precisely three hundred more pages, the reader thinks less of them than of the consummate padding.

Leonore Stubbs. By L. B. Walford. New York: Longmans, Green & Co.

Certain things are confidently to be looked for in a book by the author of "Mr. Smith" and "The Baby's Grandmother"—an English country parish, a group of country neighbors gossiping, tea-drinking, shooting, match-making and breaking. Her new story fulfils all rational expectations without repeating the characters of former parishes. A young widow returns to her father's roof, no heiress as he had supposed, but a poor dependant. He strives to keep her cooped up in the enclosure of ceremonious mourning that the neighborhood may still consider her, and incidentally himself, personages of importance. Of course, serious consequences follow on this forced and false policy, all culminating at last, however, in the correct dénouement for a light novel. The ingredients of dilemma and deliverance are, beside the bullying father and girl-widow daughter, one soft and two hard sisters, one normal aspirant to the lady's supposed fortune, one half-witted suitor, one daft apothecary suitor, the family doctor, a match-making grandmother with an eye to shekels, and the somewhat impalpable true and only prince. The heroine, a very human young person, flinches at loneliness, rebels at suppression, but at last acquires wisdom at the price of a few bruised hearts and impaired lives. The characterizing is one of the book's chief attractions, and includes a variety of new and not unoriginal actors. The story flows unhindered, perfectly readable if not soul-stirring. The parting touch, a perfect example of life's little ironies, shows that it is a mistake to think an author shallow because she writes on a small scale.

The Fly on the Wheel. By Katherine Cecil Thurston. New York: Dodd, Mead & Co.

A hackneyed subject may be redeemed by original treatment; a great theme may mould to its own beauty the threadbare garb that clothes it; but a trite plot, tritely handled—what shall be said of that, save that it finds and loses its readers with equal ease? The case in point presents the version of the Triangle now most in vogue—a Man, a Wife, and a Young Girl. The Man, we are candidly told, is a type—and how well we know him! Strong, silent, masterful, with a square jaw—the family resemblance to his great-grandfather, Mr. Rochester, is distinctly traceable. Chafing (like many a man) in garments of his own making, he blames the loom on which the fabric was woven. "It's not me," he cries, his emotion rising above grammar, "it's the world that's out of joint." The Wife, having brought him during five years of wedlock nothing more inspiring than a large dowry and three children, seems to have exhausted her possibilities, and grows monotonous. He wearies for dreams, and finds them in the eyes of the Young Girl—only a few years younger than the Wife, to be sure, but full of temperament—familiar euphemism!—and of a bewildering exotic beauty. When his conscience finally asserts itself, strenuously nudged by the one lovable character in the book, he discovers, like the Arabian fisherman, that it is easier to let a genie out of prison than to get him back again. Too much has been said and done to ignore; and even the sudden suicide of the affinity—with whom the author deals as firmly as Barrie with Tommy—does not greatly better matters, except by ending a story which, with the exception of Father James's share in it, is both unwholesome and unnecessary, though possessing undeniable interest.

The Story of a Border City During the Civil War. By Galusha Anderson. Boston: Little, Brown & Co. $1.50 net.

Dr. Anderson, a professor in the University of Chicago, was, as a young man, from 1858 to 1866, pastor of a Baptist church in St. Louis, and he relates here his experience. It is an interesting account of the struggle for the city between North and South, all of which he saw and part of which he was. A book of this kind has no value except as recording what the author observed with his own eyes, or caught from the air at the moment when the events were happening. Hence when Dr. Anderson takes from John Fiske's "Mississippi Valley During the Civil War," written a generation later, the story of Lyon's visit to Camp Jackson disguised in a "black bombazine gown," he merely encumbers his page. The incident is picturesque, and had Dr. Anderson been an eye-witness, or indeed learned of it at the moment, his confirmation of it would have been worth while. In a similar way the picturesque story of Grant's first recorded shot during the civil war, is quoted from John Fiske. When in a Fifth Street horse-car, in the spring of 1861, a blatant Secessionist was declaiming against the intolerance that would not allow men to fly what flag they chose, "not so intolerant after all," came from Grant, shabby and undistinguished in a corner, "for though many fly rebel flags, it is to be noticed that none have been hanged for it as they deserve." It is a good story, and it is unfortunate that Dr. Anderson does no more to establish its truth than repeat the hearsay of a time long subsequent. Such slips, however, are rare. For the most part our author relates what he heard and saw himself, and makes a good contribution to our knowledge of the time.

It is well to have the memory revived of such patriotic private citizens as James E. Yeatman, J. B. Johnson, W. G. Eliot, Truman Post, and Montgomery Schuyler, of the too-little known work of the Western Sanitary Commission, and of the great fair of 1864. Probably no pictures in the book are more valuable than those of the military administrators, who in succession guided the destinies of the city during the difficult hour. Among these, it has passed into history that Lyon was a marvel of quick decision and good judgment, that Fremont was vainglorious and inefficient, and that Scofield bore himself well between jarring factions. These estimates Dr. Anderson's pages fully confirm. As regards Gen. Halleck, however, this record will tend to unsettle the ordinary view, that he was a man of many shortcomings, and quite inadequate for a high command. In this book he appears as a model officer, keen, intrepid, business-like, vigorous, bringing order out of the forlornest chaos within the city, and managing well a vast department. In our recent history-writing there are signs of a revision of the country's estimate of Halleck. He, no doubt, made vast mistakes, but that his services at

times were of high value is also true—a fact which this book corroborates. Dr. Anderson's portrait of Rosecrans, too, is engaging. Discredited at Chickamauga, where his discomfiture was largely a matter of ill-luck, he was consigned to the administration of Missouri, as to a limbo fit for a man of fallen fortunes. This book shows that he did not sulk in his retirement, but served as he could, keenly alert in unmasking and confronting the widespread treachery with which in 1864 even the loyal Northwest was deeply honeycombed.

Roman Holidays and Others. By W. D. Howells. Illustrated. New York: Harper & Bros. $3.

One would need to command as rich and delicate an assortment of epithets as Mr. Howells himself in order to do justice to this book. Madeira, Gibraltar, Genoa, Naples, Pisa, Leghorn, Rome—which has two-thirds of the space—and several smaller towns pass before us in a series of entertaining cinematograph pictures which, to our thinking, no other living American, or Englishman either, could rival. For Mr. Howells avoids the psychologizing which makes Henry James's essays of travel now too heavy, and now too wire-drawn and recondite; he avoids also the point-blank, *ad captandum* air of the literary landscapists, who sit down before any scene or building and describe it with businesslike impartiality; and, finally, he avoids the flimsiness of most impressionist word-painting. There is, nevertheless, a blending of all three varieties, without carrying any one of them to an extreme. He gives us with perfect definiteness the actual environment, sketching in the beggars or priests or broad-horned cattle that happened to meet his eyes—but he does not insist too much on details; he moralizes and even psychologizes, but in an offhand, touch-and-go fashion, quite different from Mr. James's; and he indulges in plenty of reflections, but these, too, he does not press too hard.

Whoever remembers the vigor, not to say combativeness, with which Mr. Howells some twenty years ago conducted his propaganda of realism, how he satirized those of us who still found something admirable in Scott and Dickens, in Thackeray and George Eliot, will marvel at the urbanity that pervades his latest book. In those earlier polemics we heard the literary partisan, the recent convert, the doctrinaire; here we listen to the genial traveller of three-score-and-ten, who has no cause to defend, no hero to glorify at the expense of others, no creed to preach; one who sees and feels and remembers, and then reports with charming finesse. The absence of propagandism does not spring from an atrophy of opinions—far from it; but Mr. Howells has attained the art of causing his opinions to glide undogmatically into his reader's mind. You take them in along with the glimpse of landscape or with the recollection. Mr. Howells is desultory enough, without becoming formless, after the manner of the impressionists. His humor, which, we suspect, is his most characteristic gift, plays over every page. He refers frequently to the old days in which as a youth he first visited many of these scenes, but he shows no disposition to exalt the old, nor to lament over the personal transition from youth to age. He takes himself humorously, as at every turn some painting or statue or view brings before him his young self, with the undisciplined enthusiasm and immature conclusions of his earliest Italian sojourn.

The value of books of this kind depends almost entirely on the personality of the writer. Most of us have seen Rome and Naples and Genoa; all of us know them through photographs and through numberless descriptions. It is precisely because we see them through Mr. Howells's eyes, colored and shaped by his individuality, that we prize these particular sketches. As we read Mr. Howells, we think of Heine and Gautier and of still earlier travellers, who left their descriptions of travel, and we note the great change that has come about in such writings. Until recently, *Reisebilder* were likely to be spontaneous and unmethodical. The poet or novelist wrote only when he felt like it, only when he was greatly moved. His purpose was to report his intensest impressions, not to furnish an inventory of all his impressions. The modern writer of travel sketches must, on the contrary, be self-conscious, and must furnish so much copy for every day's sight-seeing. So Mr. Howells knows that, whether he spends his morning on the Pincian, or strolling through the streets, or visiting St. Peter's, or exploring the Forum, he must gather enough impressions to fill his daily stint of manuscript. The result is that there is no proportion observed in the objects which make the impressions—the description of a lizard may be longer than that of the Colisseum—and that the quality of unpremeditatedness—"the first, fine, careless rapture"—which gave charm to Heine's sketches, for instance, cannot be had Mr. Howells, Mr. James, Mrs. Wharton, and all the other adepts who travel to "write up" a country, can never experience a *careless* rapture, because at each moment they are taking stock of their impressions and thinking how to translate them into language. The obligation of finding an adjective to fit every object, however trivial, precludes spontaneity and selection, because there are many objects which, for all ordinary purposes, are not worth labelling. Great literary critics do not waste their time in analyzing tenth rate verse; but the literary landscapist can make no distinctions.

Subjective, casual, and miscellaneous, therefore, must such works be. Fortunately, Mr. Howells is subjectively rich, so that it matters little what he describes. He writes unaffectedly, without purple patches and without effort, after the manner of a glorified journalist, who, accustomed to turn out a large quantity of high-grade copy every day, has neither posterity nor an impossible perfection in view. There is a tradition that when Flaubert could not catch the inevitable word, he would roll on the floor in rage, and we are all so familiar with Stevenson's hectic pursuit of the adjective that we can see him pulling his forelock, yearning, and writhing, and at last, when he captures his word, looking up at us with the exultant expression of Little Jacky Horner. But Mr. Howell's epithets and phrases seem to come easily, do their work, and pass on with refreshing naturalness. And with Italy to stimulate his fund of reminiscence and his unfailing humor, he is a delightful companion.

Science.

Through Southern Mexico. By Hans Gadow. New York: Imported by Charles Scribner's Sons. $6 net.

The work of Professor Gadow on the reptiles, and particularly the lizards, of Mexico is widely known; for most of his scientific results have been published in the Proceedings of the Royal, the Zoölogical, and the Linnæan Societies of London. He has lectured in New York, has just given a Lowell course in Boston; and he holds the chair of zoölogy in Cambridge, England. The present volume is based on two journeys which he and Mrs. Gadow took during the period from June to September in 1902 and 1904, through some of the wilder portions of southern Mexico. The style is clear, and the author's observations reveal the keenness of vision of a thoroughly good field naturalist. The material includes personal adventures, short dissertations on fauna and flora, and on the human inhabitants, past and present. Indeed, there is a great deal of novel and interesting information which will often hold the reader's closest attention for many consecutive pages. Some of the ground has been covered by other writers and it would have been as well to have omitted the first three chapters treating the well-known region of Vera Cruz, Orizaba, and Mexico City. But when the author starts southward he offers something of interest at every step. His very method of travel was novel: he secured a full-sized baggage car and transform-

ed it into a "private car" by curtaining off a bedroom, supply-room, and guides' sleeping quarters. This was sidetracked at any station where the surrounding country looked inviting, to remain for a longer or shorter time, as camp and base of supplies. By this method Professor Gadow worked gradually southward to the Tehuantepec Isthmus Railroad.

Since the author touches upon all phases of life and nature, a detailed review is impossible here; but one or two facts stand out sharply. Seldom is there presented in print such a striking example of the enormous development of life and the equally great destruction of it in the tropics, as is shown by the account of the tree-frogs of Presidio. Over an area but little larger than a tennis court there suddenly appeared a vast multitude of large, green tree-frogs, uttering cries which, taken as a whole, sounded like the escaping steam from many engines. An absurdly low estimate gave 45,000 as the total number, of which at least half were females laying from five to ten thousand eggs each. Again taking the lower estimates, this would give at the minimum one hundred million eggs.

> The spawn literally covered both ground and water thickly. But the greatest surprise awaited us on the following morning, when we went to photograph the scene. There was not a single frog left: the water had all evaporated, and the whole place was glazed over with dried up spawn! The prospective chance of millions of little frogs was gone, their expectant parents having been deceived in calculating their day of incarnation. That was on the 4th of July, several weeks after the beginning of the rather fitful rainy season.

In any general account of a country errors cannot fail to slip in, but the chief fault of the author is a tendency to jump at conclusions or to draw inferences that are rather too sweeping. For example, in a general account of the distribution of color in a tropical forest (p. 108) we find the assertion:

> Lastly, those few animals that live on the ground itself, are nearly all dark of color, whether toads, frogs, lizards, snakes, or birds. It would be no good to wear a beautiful dress in a badly-lighted place; or rather, it is impossible, as such colors could not be developed there.

The last seven words have no foundation in fact, for we find many exceptions of color in frogs and snakes (such as the coral snakes, which the author himself describes), and in fishes and other creatures of the deeper, unlighted portions of the sea. A more serious defect is the lack of a good index. The seven pages devoted to one are almost wasted. None of the illustrations is noteworthy, and some of the drawings are slovenly.

The educational museum of Teachers College has opened, until February 13, an exhibit of material collected in various parts of the world by Prof. David Eugene Smith to illustrate the historical development of mathematics. The growth of number systems is illustrated by several Babylonian cylinders, casts and photographs of many others, and similar material; by magic squares and mystic trigrams on stone, and in Chinese silk; and by specimens of dice from Egyptian to modern times. The development of mechanical calculation is shown through Egyptian slates, Greek abaci, Roman reckoning pennies, and mediæval tally sticks down to contemporary machines that perform all arithmetical operations. The growth of trigonometry and astronomy is similarly illustrated through European and Oriental instruments. There are ancient and mediæval compasses, spheres, astrolabes, dials, calendars, weights, and measures. Selections from some 300 Persian, Arabic, and Indian mathematical manuscripts, and from some 600 Chinese and Japanese works are shown —the most interesting probably being the works of Bhaskara, the greatest Hindu mathematician; the monumental Chinese encyclopædia of mathematics, and the series of manuscripts marking the Oriental developments of geometry. The development of arithmetic is illustrated by plates from Professor Smith's descriptive catalogue of some 400 works published before 1601, perhaps the largest collection ever made. Later mathematical developments are illustrated by many rare volumes and selections from Professor Smith's collection of 5,000 autographs, portraits, and medals. Among these are several manuscripts, a dozen medals, and 150 portraits of Newton. The exhibit is open to the public.

Dr. Thomas Gray, vice-president of the Rose Polytechnic Institute of Terre Haute, Ind., head of the department of mechanical and civil engineering, died December 19. He was born in Lochgelly, Scotland, in 1850, and was graduated from Glasgow University in 1878. In 1879-81 he taught electrical engineering in the Imperial College at Tokio. For the succeeding seven years he was the assistant of Lord Kelvin in electrical engineering; he represented him and Prof. Fleeming Jenkin during the manufacture and laying of the Mackay-Bennett transatlantic cable. Dr. Gray was author of "Directions for Seismological Observations" in the British Admiralty "Manual of Scientific Inquiry," of articles on telegraphs and telephones in the "Encyclopædia Britannica," and of many papers on scientific and engineering subjects. He was on the expert staff of the "Century Dictionary" in the department of electricity.

News comes from Würzburg of the death of the eminent pathologist, Eduard G. von Rindfleisch, at the age of seventy-two. He was a student under Virchow, and after various positions became, in 1874, Virchow's successor at Würzburg. His researches into the nature of tuberculosis were of acknowledged importance. He published a number of books, including "Lehrbuch der pathologischen Gewebelehre" and "Elemente der Pathologie."

The death is announced of Dr. Giuseppe Ciscato, in his fiftieth year. He had, since 1886, been connected with the Padua Observatory, where he accomplished a good deal of notable work in meteorology and geodesy, as well as in astronomy. He published studies in spherical trigonometry and in the use of the micrometer.

Drama.

EARLY ENGLISH DRAMA IN RELATIONS TO THE GOVERNMENT.

Documents Relating to the Office of the Revels in the Time of Queen Elizabeth. Edited with notes and indexes by Albert Feuillerat. Pp. xvii.+513. [Vol. XXI. of the series Materialien zur Kunde des älteren englischen Dramas, under the general editorship of W. Bang.] Louvain.

Government Regulation of the Elizabethan Drama. By Virginia Crocheron Gildersleeve. Pp. vii.+259. New York: Columbia University Press; The Macmillan Co., agents.

Every great movement may be studied under two aspects: the Germans call them internal history and external. The internal history of our early drama consists in the treatment of the lives and writings of the dramatists and of the creative impulses to which they gave utterance. This we have had amply presented in the monumental works by Ward and by Schelling. But the external history of the drama, the treatment of those social and political forces which worked for or against it, is still to be written. Some questions have, indeed, been touched upon by Ward, more by Schelling. In the main, however, the relations of the drama to the nation at large and to the government in particular, whether royal or municipal, are not yet clearly and fully adjusted. This is not surprising. Not only are the facts hard to get at, buried in official documents, but the subject itself demands of the historian a large measure of self-abnegation. One must be indeed a model of insight and patience to see one's way through the maze of tricks and counter-tricks between players and censors.

The two books before us, the latest contributions to the solution of the problem, are as different as can well be imagined. Feuillerat's work, a bulky quarto of over five hundred pages, is little more than a verbatim reprint of official papers: first, the documents relating to the establishment of the Office of the Revels, next, the accounts of the Revels. The period covered is that of the reign of Elizabeth. Apart from the editor's notes, pp. 425-476, the volume offers nothing for the ordinary reader. It is literally a storehouse of dry facts and figures, names, dates, from which the future expert must draw conclusions. In the preface the editor informs us that the present volume is but the first of a *corpus* of revels-documents; that a second volume, relating to the Revels in the times of Edward VI. and Mary is ready, that a third volume upon the Court Festivities of Henry VIII. is

in preparation, to be followed by a fourth, on the Revels of the Stuarts. In addition, he hopes to give, in an independent book, "the marrow of the documents." Truly an heroic undertaking. Even admitting that the volumes for Edward and Mary and for Henry will be much smaller than the present, we may safely guess that the Stuart volume ought to be even bulkier. A mere glance at M. Feuillerat's pages fills one with admiration for his unflagging zeal and accuracy. Dry enough the reading is. For example, p. 193:

Predor & Lucia, playde by Therle of Leicesters servaunts vpon Saint stevens daye &c.

Alkmeon, playde by the Children of Powles on Saint Iohns daye &c.

Truth, ffaythfulnesse & Mercye, playde by the Children of westminster . . . vpon New yeares day &c.

Herpetulus the blew Knighte & *Perobia,* playde by my Lord Klintons servantes the third of Ianuary &c.

The entries are for December-January, 1573-4. One gets an insight into the doings of the Earl of Leicester's troupe and Lord Clinton's (see F. E. Schelling, "Elizabethan Drama," Vol. I., 144). In subject we note one classic, or pseudo-classic piece, two pieces from mediæval romance, one from the moralities. All four are mentioned by Schelling; here, however, we get them *in situ.* We also learn that at the one Christmas season these four plays, and two more, six in all, were given at Whitehall. The court drama thus takes on body and movement. The editor gives (pp. xiii-xvii) a chronological list of plays mentioned in this volume (1559-1589), with references to page and line of the text. It is a bewildering list of entertainments, some named, some without title. After the texts have been thoroughly scrutinized by competent scholars, we shall know considerably more about the early drama. For the present we are tempted to echo the colloquy between Faust and Mephistopheles on their way up the Brocken:

Faust. Da muss sich manches Rätsel lösen.

Mephistopheles. Doch manches knüpft sich auch.

We have not discovered that "A historie of fferrar," given on Twelfth Day, 1582-3, is noted elsewhere. The editor, in his note (p. 448), raises the question: "Can this ['The Paynfull Plill-grimage,' 1567-8], be 'Everyman'?" And calls attention to line 565 of "Everyman":

So must thou or thou scape that paynful pylgrymage.

The mere conjecture of a scholar like M. Feuillerat should, of course, be heeded. Yet we venture to remark that the phrase, "pilgrimage of man" was current in Middle English literature in connection with the translations from De Guilevile's "Pelerinage." The editor's note (p. 449) on "The Kinge of Scottes," in criticism of Mrs. Stopes's conjecture, is one of many evidences of his quick perception and wide reading. In conclusion we express to M. Feuillerat our warmest wishes for the completion of his great enterprise; most of all do we long for his "marrow of the documents." Already he has put into our hands the means of correcting the work of Collier and of Chambers.

Miss Gildersleeve's essay is wholly different in scope and character. In scope, it ranges from Henry VIII to Charles I. In character, it deals with everything that helped, checked, or interfered with the acting of plays. The Master of Revels is, of course, the central figure; but, in addition, we read of the doings of King (or Queen) and Council, of judges, lords mayor, bishops, municipal bodies, and other public functionaries. We cannot pretend to give even the briefest outline of contents; we must restrict ourselves to indicating general value and to touching upon a few special points.

As a whole, the essay is most readable and even enjoyable. The humblest lay student of the drama will gain a lucid conspectus of this battlefield of motley forces. The author marshals her data effectively; certainly, she does not weary the reader with a mere show of erudition. The erudition is there, but not for parade. The distinctive feature of her style is clearness and sobriety of statement. Chapter iii, "The Nature of the Censorship" (by the Master of the Revels), will doubtless be found the most interesting. The successive Masters were, it is clear, gentlemen in the aristocratic sense, and their chief function, as concerned public plays, was to maintain public order, or rather to avert public disorder; also, to collect for the Crown some revenue from licenses. There is no evidence that any of the Masters looked upon himself as a Cato, a censor of public morals. On the contrary, they tolerated much that our public opinion would pronounce insufferable. In general, the Masters were well disposed towards players and playhouses. In fact, as licensing became more and more the custom, the licensing of a play seems to have carried with it the guarantee of the Master's protection against mayors, city councils, and other strait-laced busybodies. By the Parliamentary act of May, 1606, the "abuse of the Holy Name of God" was strictly prohibited, and this prohibition was enforced; but mere morals were of minimum importance and seldom furnished an occasion for interference. (See, on this point, the censoring of D'Avenant's "Wits," pp. 127-128.)

Another interesting fact (brought out at p. 83) is that the license of a play might be used as a means of preventing the theft of that play by a rival company. Still another fact is that the best companies, for instance Shakespeare's, seldom if ever got into serious difficulty with the Master. Even where there seemed to be offence given, the trouble was promptly smoothed over; the company's general reputation was evidence that the offence was unintentional. A signal instance was the performance of "Richard II" on the eve of the Essex rebellion (p. 99). Only writers and players of "sorry stuff" were in serious danger. Miss Gildersleeve's judgment (pp. 134-35) seems to us conclusive:

What would the Elizabethan drama have been, had it been free from this supervision? Not materially different, I imagine, from what it was. The dramatists would no doubt have been spared much annoyance, for it must have been peculiarly exasperating to them to have their verses spoiled by such "reformations" as we have seen; but the general content and spirit of their plays would probably have been much the same. They would undoubtedly have indulged in much more personal satire and scurrilous abuse of living individuals—a loss to which we can easily reconcile ourselves, as we can to the expurgated oaths. They would doubtless have written more plays treating current politics, and especially foreign relations and affairs. . . . But even when the drama did touch politics, it was rather, especially under the Stuarts, the mere expression of the views of one faction of the court party . . . than any discussion of the great political and religious questions which were stirring so profoundly the heart of the nation. This was not due to the censorship. Nearly all those seriously concerned for civil liberty and religious reform were comprised in the party loosely called Puritan, and to them the stage was anathema.

Sidelights upon the past and hints for the present are in plenty. Thus (p. 177) we learn that the Lords of the Queen's Council in 1591 became exercised over the frequency of plays on Sundays and Thursdays—Thursday was the chief bear-baiting day—and directed that on these two days no plays be allowed, "for the greater reverence of God and the encouragement of the Queen's bear-baiters." This coupling of piety and sport may provoke laughter or indignation, according to our temperament. Yet shall we throw a stone, we who have seen party managers conducting a great political campaign, with the sophistical confusion of race-track gambling and "personal liberty?" In the matter of language we note one point of present interest. Such constructions as "the *then* King" are usually condemned as Germanisms. Yet in Lord Hunsdon's letter, 1594, to the Lord Mayor (p. 182) we read: "Where my *nowe* company of players," etc.

How far Miss Gildersleeve's data may need to be modified in accordance with Feuillerat's work, we cannot at present undertake to say. She has written, of course, in ignorance of Feuillerat's labors, the two books appearing almost simultaneously. At first glance it seems

to us that her remarks upon Benger, Blagrave, Tilney, and Buc may need adjustment to Feuillerat's notes, pp. 425-426, 439-440. Certainly Miss Gildersleeve has mastered all the literature accessible when she was making her studies. The bibliography is excellent. and the index is up to the highest standard. Her interpretation of Lord Coke's decision (p. 200) shows that she is abundantly able to think for herself. Her judgments are not only sound, but moderate and dignified. We quote from her concluding remarks:

To men who had already developed something of the modern sensibility in matters of decency and morality, most of the later Elizabethan [the term covers the reigns of James I. and Charles I.] drama must indeed have seemed hopelessly abhorrent. . . . There was much to justify extreme measures at the time of the closing of the theatres. As one thinks of the stage of the period, no longer expressive of the best feelings of the nation. as one remembers the preposterous horrors into which tragedy had degenerated, and the inexpressibly offensive indecency of much of the comedy of the time, and with this picture of the drama in mind, reads the grave and dignified phrases of the edict of 1642, one feels that, for the moment at least, the Puritans had the better part.

Yes, truly the later drama might well recall the Biblical saying, that a man's worst foes are those of his own household.

Charles Rann Kennedy's notable tragedy, "The Winter Feast" (see the *Nation* of December 3, p. 557), may now be read in the handsome printed form supplied by Harper & Brothers. Although it failed in stage representation, owing to mistakes in management and other causes, it is a play of powerful imagination and excellent literary and dramatic workmanship, which will well repay the attention of the intelligent reader.

An English translation of Hermann Sudermann's "John the Baptist," by Beatrice Marshall, has been published by the John Lane Co., with all the attractions of black type, fine paper, and ample margins. Whatever may be the case with the original, the English text possesses no special quality to compensate for the inherent nastiness of the Salome legend or for the misrepresentation of an heroic Biblical figure.

Wilhelm von Scholz is the editor of a series of books called Deutsche Dramaturgie (Munich: Georg Müller), of which the second volume, "Schillers Dramaturgie," has just been published. It contains all writings and remarks of Schiller relating to the drama and the stage, compiled and selected by Otto Flackenberg.

"The Battle," by Cleveland Moffett, which was produced in the Savoy Theatre on Monday evening, tells an interesting theatrical story and is likely to prove a popular success, but would have been much more valuable if the author had worked out the problem suggested by his opening acts to some definite and logical conclusion, instead of exerting his ingenuity to create an apparent balance between opposing arguments, and so bring about the conventional happy ending. In a speech before the curtain he explained that he had no intention of taking sides; the result is a commercial play instead of a vital drama. He imagines the case of a multimillionaire who discovers his abducted son in the person of a young agitator filled with the crudest socialistic theories. The father becomes the inmate of a tenement himself in order that he may study the lad's character, win his esteem, combat theories with facts, and qualify him for the management of the vast estate to which he is unconsciously heir. The story, on the technical side, is melodramatic, artificial, and improbable; but the scheme is a good one, and throughout three acts the different points of view of capital and labor are illustrated and contrasted with considerable cleverness and effect, if without much originality or depth of insight. The fact that there are two sides to this, as most other questions, is emphasized and the follies and vices of improvident labor are dwelt upon, as well as the remorselessness and greed of predatory wealth. The play, therefore, is something out of the common, so far as the main idea of it is concerned, but comes to naught in the end, because the author lacked either convictions or the courage of them. But it undoubtedly contains the promise of something far better and stronger in the future.

H. Granville Barker and J. E. Vedrenne are no longer at the little Court Theatre, which, under their management, was the most interesting in London, but their influence survives. As most of our readers know, they inaugurated special afternoon performances for the presentation and trial of new, and the revival of old, plays which would have then seemed impossible ventures of any but private societies and amateurs. The afternoons were dramatically a success, and, to judge from the crowds they drew, financially as well. An example was set which Beerbohm Tree now bravely follows with an "Afternoon Theatre," whose object is "to give further opportunities for the presentation of modern plays and for the occasional revival of classical plays." Mr. Tree, naturally, devotes his own theatre to the purpose, and Tuesday, Thursday, and Friday are the afternoons set apart for the purpose. This is distinctly a new departure for a popular theatre like His Majesty's, and it has been awaited with much curiosity and doubt. But the first performance (Tuesday. December 8) has been encouraging. Mr. Tree has a striking capacity for transforming the play that comes into his hands, whether modern or classical, romantic or realistic, native or foreign, into an elaborate spectacular display with himself. varying in get-up but seldom in personality, as the principal figure. At the Court Theatre, however, the stage setting was always of the simplest and there was no principal figure; indeed, the excellence of the performance depended upon the thorough training of the entire company to act together, with no one actor or actress dominating the others. It is pleasant then to find that Mr. Tree, on his first afternoon, has had the wisdom to efface himself and not to appear at all, and moreover to take no undue advantage of the chance offered by the play for elaborate or meretricious effects. This play was Hauptmann's "Hannele," as translated by William Archer. It would be hard to imagine "Hannele" on the regular programme of any theatre in London. It is, in fact, as in name, a "Dream Poem," and dreams or poems, unless interpreted with the melodramatic emphasis of Irving in "The Bells" or Mr. Tree in "Ulysses" and "Herod," would be unintelligible to the great British public. One matter of regret was the inability of most of the actors to deliver their lines with the clearness and intelligence that, especially in a play like "Hannele," is the first essential. No matter, however, what the defects of the performance, there is no question of the interest and importance of the experiment. With the stage so largely given over to musical extravaganza, to light and trivial comedy and farce, any effort to appeal to people who ask for drama is to be respected.

Music.

Chapters of Opera. By Henry Edward Krehbiel. New York: Henry Holt & Co. $3.50 net.

In the years 1885-1890 Mr. Krehbiel gave to the world five volumes containing reviews of the musical season in New York. While extremely valuable for reference, these books contained too much that was of ephemeral interest to appeal to the general reader, and the publication was discontinued—a fate which has overtaken similar experiments in Paris and elsewhere. Of an entirely different character is the new volume, "Chapters of Opera," which contains much more than its unpretentious title indicates. The sub-title gives a better idea of its contents: "Historical and Critical Observations and Records concerning the Lyric Drama in New York from its Earliest Days down to the Present Time." Here everything is eliminated except what is almost or quite as interesting to-day as it was at the time when it happened. Take the contents of a single chapter as a sample:

The Public Clamor for German Opera—Oscar Hammerstein and his First Manhattan Opera House—Rivalry between Anton Seidl and Walter Damrosch—The Latter's Career as Manager—Wagner Triumphant—German Opera Restored at the Metropolitan—"The Scarlet Letter"—"Mataswintha"—"Hänsel und Gretel" in English—Jean de Reszke and His Influence—Mapleson for the Last Time—"Andrea Chenier"—Melba's Disastrous Essay with Wagner—"Le Cid"—Metropolitan Performances.

Nearly every one of the twenty-four chapters calls up similar memories, and it may be said at once that the record of the facts is here presented, not only in a readable manner, but without bias, and with a painstaking accuracy of which only two other musical scholars in this country—Philip Hale and O. G. Sonneck—would be capable.

What prompted the preparation of this volume at the present time was the

completion of an existence of a quarter of a century by the Metropolitan Opera House. During all this period Mr. Krehbiel has occupied the same seat at nearly every important performance, and he is thus able to record at first hand the interesting and instructive struggle which has been going on in that house between fad and fashion on one side and serious artistic endeavor on the other. This struggle has a social as well as a musical interest. The history of manners, as well as of music, is touched on more than once. At the present day, frequenters of the Metropolitan are seldom annoyed by talking or laughter in the boxes; but it was not always so. At one time the conduct of the plutocrats in these boxes grew to be so intolerable that there were frequent demonstrations of disapproval and rebuke from the listeners who sat in the parquet and balconies, and in January, 1891, the directors posted in each box a notice reading:

> Many complaints having been made to the directors of the Opera House of the annoyance produced by the talking in the boxes during the performances, the board requests that it be discontinued.

Mr. Krehbiel begins with the first performances of Italian opera in New York, which occurred at a period so recent that they are within the memory of persons still living. He dwells briefly on the ballad operas, the Garcia troupe, Malibran, Niblo's, and has a good deal to say about Mozart's librettist, Da Ponte, on whom he is an authority. In those early days, Italian opera was the only kind in vogue, but it is interesting to note that already before the civil war, a plea for the permanent substitution of English for Italian opera was made by the *Tribune's* critic, Mr. Fry. He wrote three and a half columns on the subject, to the great indignation of Horace Greeley, who had gone to Washington to expose Pierce and Cushing's "perversions of history," and then found his article crowded out to make room for Fry's, concerning which he wrote: "I don't believe three hundred people who take the *Tribune*, care one chew of Tobacco for the matter." There are other good anecdotes in this volume, one of the most amusing of which relates to Mapleson and his success in the unprecedented feat of not only getting into debt with Patti (who always demanded cash in advance) but actually borrowing $75 of her under the circumstances. Almost equally strange is the historic record of the failure of Patti, in her prime, to save Italian opera at the Academy from the deadly rivalry of German opera at the Metropolitan. The story of the seven happy years of German opera at that house is related in full, with details not known to newspaper readers Then came the reaction, the banishment of German opera, and its restoration through the enthusiasm of the very singers who had been brought from Europe to kill it. Mr. Krehbiel's remarks on the part played in our operatic history by Seidl, Lilli Lehmann, Jean de Reszke, and others are extremely interesting, and valuable. He dwells, too, on the important fact that it was in this city that the two greatest of all Wagner singers, Lehmann and De Reszke, first discovered their specialty. The narrative is continued down to the present year, two chapters being devoted to Hammerstein's first two seasons. The volume is embellished by over seventy portraits, mostly in costume, and to Anton Seidl falls the deserved honor of serving as the frontispiece.

August Göllerich has written a 350-page book on Liszt which includes, among other things, seven compositions not before printed (Berlin: Marquardt & Co.). Another new book, Dr. Julius Kapp's "Wagner und Liszt: Eine Freundschaft" (Berlin: Schuster & Loeffler), is a monograph with much new material on the friendship between those two men.

The first novelty which Mr. Gatti-Casazza provided at the Metropolitan Opera House was "Le Villi," a juvenile opera by the beloved Puccini. As this lasts only an hour and a half, it was followed last Thursday by the popular "Cavalleria Rusticana," with the biggest cast ever heard in it—Caruso, Destinn, Gay, Amato. As a matter of course, there was a large (though not crowded) audience, although the price of $5 seats had been advanced to $7. But nobody was deluded as to the part played by the novelty. It was voted a bore and a dead failure. To students of musical history, it was, however, of interest, because it contains the germs of the "Young Italian" style which Mascagni borrowed, developed, and brought to the attention of the whole world with his "Cavalleria Rusticana."

Walter Damrosch has made two new orchestral arrangements for concert from Wagner operas, which will have their first hearing at the holiday programme, to be given by the Symphony Society at Carnegie Hall Sunday afternoon, December 27. The first is from "Siegfried," and includes the music descriptive of Siegfried's ascent of the mountain, and pressing through the flames surrounding the sleeping Brunnhilde. The second, which Mr. Damrosch calls "The Magic of St. John's Eve," is from "Die Meistersinger." Other selections in the afternoon's programme will be "Tannhäuser's Pilgrimage" to Rome, the prelude to "Lohengrin," and the "Tristan" finale. Madame Jomelli will be the soloist.

The Oratorio Society's Christmastide performances of "The Messiah" will be the seventy-fifth and seventy-sixth since its organization in 1873. Handel's work will be sung, under Frank Damrosch's direction, at Carnegie Hall, on Saturday afternoon, December 26, and the following Tuesday evening. The chorus of the Oratorio Society will be assisted by an orchestra and organ, and by the following soloists: Corinne Rider-Kelsey, Gertrude Lonsdale, George Hamlin, and Dalton Baker.

Mendelssohn performances are being everywhere prepared for, in order to celebrate the hundredth anniversary of Mendelssohn's birth, February 3, 1909. The first entertainment of the season bearing direct relation to the celebrations will be a stage performance of "A Midsummer Night's Dream," at Carnegie Hall Saturday afternoon, January 2. The Ben Greet players will give a regular stage performance, with costumes, and the orchestra will perform all of Mendelssohn's musical setting.

Art.

Painting in the Far East. By Laurence Binyon. New York: Longmans, Green & Co. $6 net.

Mr. Binyon has not produced the great history of Chinese and Japanese painting which awaits the hand of some exceptionally endowed and privileged writer. The resources upon which he has drawn are scanty: the paintings in the British Museum, the Arthur Morrison Collection, the Freer Collection, and the reproductions in the *Kokka* and the superb "Select Relics of Japanese Art" edited by S. Tajima. His task has thus been comparable to that of a critic who should attempt to describe Italian art without the treasures of Italy. But within the limitations imposed upon him, he has made a useful and interesting volume. If he writes of Professor Fenollosa as if that critic were still living and able to give us the promised and much-desired work on Japan, such slips are rare, and in general he has availed himself of the most recent helps—still very few—toward mastering his subject.

Among these sources Mr. Binyon does not omit Dr. Stein's great work on the explorations in Chinese Turkestan ("Ancient Khotan," reviewed in the *Nation* April 9, 1908, p. 332), with its astonishing evidence of the influence of Greek art on the Far Eastern peoples of Asia. These glimpses into the past throw daily more light on that miracle of history by which a little folk on the Ægean Sea sent out their sense of form in lines of power radiating endlessly to the East and the West. Mr. Binyon lays sufficient stress on this fact historically, but in his chapter comparing the art of Orient and Occident he does not take advantage of this influence as a point of departure. He has his eye too exclusively on the painting of the middle ages and the renaissance in Europe. The contrast he draws is initially sound. He explodes easily the earlier view which found in the West an art of form and in the East an art of color. Not color, but line, is the characteristic of Eastern painting, or, more precisely, rhythmical line:

> In this theory every work of art is thought of as an incarnation of the genius of rhythm, manifesting the living spirit of things with a clearer beauty and intenser power than the gross impediments of complex matter allow to be transmitted to our senses in the visible world around us. A picture is conceived as a sort of apparition

from a more real world of essential life. That is well said, but we question whether Mr. Binyon goes quite to the root of the matter. This apparition is not precisely a glimpse into "a more real world of essential life"; that, we take it, is an Occidental philosophy. What seems rather to need emphasis is the feeling always of rhythmical evanescence caught from the Buddhistic law of universal impermanence. This bit of moon-lit scenery, this poised tiger or fish, this delicate spray of blossoms, this floating human figure, produces its entrancing effect because it is a glimpse of life vibrating from one impenetrable obscurity to another. The most fruitful point of comparison would be to show how on one side the Greek vision of form was modified and subtilized by the Oriental sense of transitoriness, and on the other side by the renaissance conception of stability and scientific law. And to this comparison should be added the still more important truth that in Greek art itself, at its best, there was a Platonic mystery of pure stationary form as the impress of the infinite on the finite, which neither Oriental nor Occidental ever again quite recovered or understood.

But in adding our own theory to Mr. Binyon's excellent discussion of principles we are forgetting the chapters in which he follows the course of Chinese and Japanese painting from the work of Ku K'ai-chih in the fourth century A. D. (with a reproduction from a picture of his in the British Museum, the oldest Chinese painting whose existence is known) to the marvellous and comparatively well-known works of Hokusai (b. 1760) and the color-prints of Ukiyoyé. The record necessarily touches on only the chief moments and the great names, but Mr. Binyon's text is pleasant and discriminating, and the full-page reproductions are excellent collotypes. For those who desire an amateur's acquaintance with a great and fascinating art, the book can be heartily recommended. It is also one of the handsomest of the holiday productions.

David C. Preyer's "The Art of the Netherland Galleries; Being a History of the Dutch School of Painting Illuminated and Demonstrated by Critical Descriptions of the Great Paintings in the Many Galleries" (Boston: L. C. Page & Co.) is a mildly entertaining book by an author with no charm of well-formed literary style, with apparently no profound convictions, no original philosophy of art and life, but with an equipment of generally sound ideas as to the relative standing of the Dutch painters, and with an indubitable fund of information on various aspects of his subject. His interest and erudition find expression in a well illustrated volume of nearly 400 pages, which would be of undoubted assistance in preparing for a paper at the woman's club or for a tour of the Netherlands. Mr. Preyer is proud of not having "burdened these pages with the romancing fancies and fairy tales which tradition has gathered around many of the more prominent men." Yet, to the student who appreciates art in its larger relationship to society the legends and apocryphal stories are often quite as illuminating as verified facts, and should at least be stated for what they are worth. Fortunately the author's practice is somewhat better than his theory, for he gives not a few entertaining personalia. Mr. Preyer, like many who write harmlessly harmful criticism (for these illustrated art books, it may be suspected, are looked at more often than read), builds his whole work around Leonardo's aphorism that "the true artist must study and follow nature alone," a dictum which is true only if a very broad definition of "nature" is accepted. For art itself is certainly not supernatural. Every act of artistic creation is an outcome of varied experiences, extending over the greater part of the artist's life. No realist, no impressionist who has ever seen works by other painters, fails, however sincerely he thinks he is following nature alone, to be influenced in his technical procedure by concepts thus previously integrated. No artist, on the other hand, who imitates or even copies work of another country and age can help putting into his art some of the results of his observation of his immediate surroundings and his reaction upon them.

"The Old Masters: One Hundred Examples of Their Work Chosen from European Galleries and Reproduced in Color with Notes on the Pictures," is a handsome quarto in two volumes, published in London by J. M. Dent & Co., and imported by E. P. Dutton & Co. Most of the great collections have been laid under contribution, but the National Gallery has been drawn on almost too freely. We confess, indeed, that the principle of selection is not wholly intelligible. No two critics, of course, would agree in such a matter, and it is perhaps sufficient if, as in this case, practically all the pictures are important work of important painters. Possibly the exigencies of mechanical reproduction have in some instances determined the choice. The defects of the three-color process are so well known that we need not dwell on them. In these volumes one can, of course, find typical specimens of hardness of outline and inaccuracy in rendering tint—for example, Murillo's Immaculate Conception from the Prado. But the results as a whole have been remarkably successful and the collection is very instructive and interesting. The text consists of brief biographical data, usually adequate; explanation of the pictures, and general comment on the artist. The commentator, whose name is not given, has occasionally been unable to resist the temptation to gush, which has overcome so many art critics. But the pictures are the thing.

A pretty piece of sentiment is "Our Home and Country," pictured by W. L. Taylor (Moffat, Yard & Co.). Mr. Taylor's illustrations to patriotic poems of Longfellow and others are brought together in a series of full-page plates that will find warm acceptance among those of a certain taste.

With progress in the making of beautiful books so evident among the Germans, the fifty-seventh volume in Marquardt & Co.'s Kunst series, "Buchkunst," seems timely. The author, Felix Poppenberg, is one of the most interesting critics of art in Germany to-day.

Dr. Oscar Münsterberg, whose comprehensive work on Japan and its art was published a decade ago, has now written a small volume on Japanese art alone: "Japans Kunst" (G. E. Stechert & Co.).

The eighth annual report of the managing committee of the British School at Rome has just been published, showing the activities of the school in investigating the Roman remains of Central Italy, the aqueducts of the Roman Campagna, and the prehistoric remains of Sardinia and Malta, and in preparing a full descriptive catalogue of the Capitoline Museum, which is soon to be published. The work done in Malta is of special interest, since the prehistoric remains of that island are of great importance. The great megalithic structures of the Gigantia, Hagar-Kim, and Mnaidra have long been known. They are generally believed to date from the Bronze Age, and to have served as sacred buildings. Recently an extensive *hypogæum* called Halsaftieni, has been discovered close to Valetta, cut in the rock, the arrangement of which is similar to the other edifices, though it seems to have served at some period as a burial place. In it was found a large quantity of pottery, some of which is peculiar to Malta. Other prehistoric structures, probably dwellings, were also located.

Commendatore Boni has been pursuing his investigations of the Velia and the area adjacent to the Arch of Titus on the Roman Forum with interesting results. There are now uncovered two great parallel lines of masonry enclosing a vast area at the foot of the northern slopes of the Palatine. These massive foundations, composed of fragments of tufa and travertine, mixed up with pieces of terracotta and broken marble ornaments, are attributed to the sixth century A. D. They furnished a fortified defence to the Palatine Hill of which the towers, connected by corridors, can still be traced. Within the area which these walls enclosed stand the ruins of the ancient *horrea* (magazines and granaries of all kinds), and of many other buildings, some of which date back to the earliest days of the Roman Empire. Near the Arch of Titus the line of fortifications cut through a building which dates either from the later republic or the beginning of the empire. The ground floor of this republican house still retains some of its mosaics. The most remarkable feature of the house is its underground portion divided into numerous small corridors and courts and small chambers, the floors of which still preserve the brick ridges that once supported beds. In one of these chambers the walls, which were filled with nails, showed traces of about twenty coats of paint and whitewash; some traces of an inscription are still discernible, as well as a painting of three Bacchic thyrsi. Another series of rooms contained baths. A large quantity of pottery was found in this house, including about 200 lamps, some with painted designs, a number of fine fragments of Arretine vases, and many pieces of glass.

Prof. J. Garstang of the University of Liverpool, in a recent lecture before the Royal Asiatic Society in London, gave the

results of an archæological expedition in Asia Minor, from which he has recently returned. A concession had been obtained for excavating the ruins of Sakji-Geuzi, and a preliminary survey was made of this important site, which is expected to yield valuable evidence for the state of culture reached by the Hittites. On excavating one of the mounds the explorers discovered a temple in excellent preservation and a series of sculptures. As these had not been exposed to the weather, the inscriptions and carvings were much clearer than on any Hittite monuments previously discovered. Although found in what was only a provincial city the sculptures were of good quality. By paying special attention to the stratification of the mound it was found that the site was occupied from neolithic times to the end of the Hittite power. The soundings made in other mounds proved that they would abundantly repay excavation, and Professor Garstang is therefore looking forward to ten or fifteen years of excavation of that site, and is confident that the work there will throw much light on the great Hittite problem.

Among the exhibitions at the dealers' galleries in this city are "thumb-nail" sketches by well-known artists at Powell's, till December 30; bronzes by American artists, Macbeth's, December 31; pastels by Walter Griffin, Bauer-Folsom's, December 31, Italian laces and embroideries copied from old designs by women of the New York Italian colony, Scuola's, December 31; paintings, Edward Gay, Clausen's, January 4.

Finance.

THE REALITIES.

A severe break in prices on the Stock Exchange, such as has just occurred, usually opens the eyes of many people to facts which they had been unable or unwilling to see before. This office the present reaction in prices has helped to perform.

The best judges, in and out of Wall Street, declared in October that Mr. Taft's success could hardly of itself cause prosperity, or Mr. Bryan's success adversity. They admitted the "holding-up of orders" on the eve of election day, but they now explain both the spasm of trade activity in the fortnight after November 3, and the subsequent relapse to quiescence, as a perfectly natural result of these postponements. Some of them are beginning to hint that, with merchants' shelves so bare and underlying conditions working so normally towards improvement, we might by this time have been pretty much where we are to-day, even if Bryan had pulled through. We should have had a break on the Stock Exchange, of course, and a week or two in which merchants would have shaken their heads sorrowfully when they met, wondering who was to foot the bill at Christmas. But, say the heretics, real conditions will in the long run win over sentiment. Even the worn-out rails of the Pennsylvania would have had to be replaced, whoever was choosing Cabinet officers; the $7,778,000,000 worth of American crops in 1908 would have equally found a market, whatever the voters had decreed; and shoes and clothes and hats and furniture call for renewal as surely as do rails. Therefore, one may even go so far as to imagine the great "bear movement"—the immediate and highly probable sequel to the news of a Bryan victory—to have been followed in its turn by a sudden "raid on the shorts," by a violent Stock Exchange recovery, and, finally, by a volume of general trade exactly what it appears to be to-day—something like three-fourths of normal, with an output from the Steel Corporation, on December 19, ranging from 58½ to 60 per cent. of the mills' capacity.

What have we really accomplished, since October, by way of return to real prosperity? A trained economist, when this question is put to him as regards either past or present conditions, has several tests to apply. The iron output is one, bank clearings another, business failures a third, and transactions on the Stock Exchange a fourth.

The testimony of November's iron production is commonly called disappointing, because increase in daily output over October was only 4 per cent., increase in capacity December 1 only 5 per cent. over November 1, and both of them far below the same date in such a year as 1906. But against this must be placed the fact that November's output reflected a steady and unbroken increase over midsummer, making daily production larger by 56 per cent. than that of January—a far more rapid rate of increase than in the previcus after-panic year.

November bank clearings in the United States, with their increase of 7 per cent. over October, their approach within 5 per cent. even of the enormous exchanges of November, 1906, and the actual breaking of the record of 1906 in the returns of the agricultural West, are striking facts. Expanded as the bank clearings undoubtedly were by the outburst of speculation and by an abnormally early movement of the wheat to market, they must nevertheless have had a substratum of legitimate trade underneath them.

Business failures in November were in number the smallest of any month this year, barring September, and in liabilities the smallest of any month. They do, it must be admitted, still compare unfavorably with the November record of any year in the decade past except 1907, but they none the less show consecutive improvement.

What Stock Exchange trading has had to show, last month and this, every one knows already. Stock trading had no parallel in any previous November, except in 1905 and 1904. Very much of this must be ascribed to unwarranted speculation, but transactions in bonds, with only one parallel for magnitude in our previous history, must have more meaning. They show at least one genuine point of vantage in existing conditions, as compared with those of the similar date in any previous after-panic year. The investing community is not poor. It has not, as in 1894, been compelled to forego interest on a great part of its bond investments, and to prepare for assessments on its stocks. Defaulting bonds are rare, and stocks which paid dividends in 1906 generally pay dividends now. Nor does this reasoning apply alone to investments on the Stock Exchange. When one recalls how largely holders of mortgages on real estate, East and West, had to foreclose and patiently await the doubtful sale of the property in 1894 and 1874, one will understand how different the present situation is. The contrast doubtless goes far towards explaining the strong support of the recent investment market by what Wall Street calls the "outside public"; one may ask if it does not have some bearing also on general trade. People who can buy investment bonds can also spend money liberally among the merchants.

FOR NEW YEAR'S

The Carolyn Wells Year Book

A delightful gift that reminds one daily of its giver. The inimitable Carolyn Wells, with a "star cast" of illustrators, including Miss Bertha Stuart, Mrs. M. E. Leonard, de Fornaro, Oliver Herford, and Strothmann. With weekly engagement blanks. $1.25 net; by mail, $1.35.

HENRY HOLT & CO, 34 W. 33d St. NEW YORK

OUR LIBRARY SERVICE

We have recently supplemented our service to Libraries, by procuring Out-of-Print and Scarce Books, and by importing English books.

Our Educational Catalogue contains a full list of Supplementary Reading, indicating the grade to which each title is adapted.

Our Clearance Catalogue contains overstock at special prices, and an alphabetical arrangement by authors of all cheap editions of Recent Popular Fiction and Standard Library 12mos in one list.

Our Library Catalogue of 3,500 approved titles, following A. L. A. lines, is of great convenience to small libraries.

Our Monthly Bulletin notices promptly every new book of importance.

These Catalogues are sent on request.

Three notable features of our service are: Promptness, thoroughness, and low prices.

NEW YORK, THURSDAY, DECEMBER 31, 1908.

The Week.

Mr. Taft's letter in condemnation of the Maryland plan for disfranchising the negro, will open the eyes of some people in the South. They have taken his cordial advances and amiable expressions of good will as a sign that he would wink at the injustice of tricky suffrage laws, designed to exclude all negroes, even if educated and property-owning, and to include all whites, even though poverty-stricken and illiterate. But that was a mistaken inference. Mr. Taft now leaves no doubt where he stands. He is against the enactment of any suffrage measure which would be unfair in operation as between the races. In dissecting the Maryland plan of dividing the voters into classes, he shows that the aim is to "free the whites from education or property qualifications, but to subject all negroes to them." This idea he truly declares to be repugnant to "the spirit of justice and equality," as well as in violation of the Fourteenth and Fifteenth Amendments. The whole law, asserts Judge Taft, "ought to be condemned," and he calls upon every Republican, and every Democrat, who "desires equality of treatment to the black and white races" to oppose it. The doctrines of this admirable letter apply, of course, not to Maryland alone. They strike just as hard at the suffrage laws of Mississippi and Alabama and Georgia. They make it evident that, in Mr. Taft's endeavors to win over the South, he is not going to forget the elementary principle of political justice.

Sober-minded people will be glad that Judge Wright has passed exemplary sentence upon the labor leaders, but will also be glad that the decision is to be reviewed by a higher court, and that the men are meanwhile out on bail. This gives time for passion to subside, and furnishes an opportunity for the officials of the Federation of Labor to purge themselves of contempt. Indeed, it is now reported that Mr. Gompers will discontinue in his organ, the *American Federationist*, the "We Don't Patronize" list by means of which he has carried on his boycotting, and that he will obey the law hereafter, until it is changed. If he and Messrs. Mitchell and Morrison duly submit to the legal authorities, the gravamen of the complaint against them will be removed. For their attitude has been exactly that of John Y. McKane, once boss of Coney Island, with his defiant: "Injunctions don't go here!" In the face of such a claim to be above the law and beyond reach of judicial process, the courts were bound to vindicate their dignity and assert their power. In vindicating the courts, no one wishes to see anything like vindictiveness. It is the principle which is at stake, not the exact form or severity of punishment. The somewhat turbid rhetoric and occasional excess of heat and of epithet in Judge Wright's opinion cannot blind Mr. Gompers or his counsel to the fact that it lays down what are now settled principles. Since the decision of the Supreme Court in the case of the Danbury hatters, boycotting is illegal. Labor leaders combining or conspiring to impair the property rights of any man or company are just as clearly criminal as heads of corporations or speculators would be in doing the same thing.

What is more, the protests of innocence which Mr. Gompers makes are hollow. Consider his repeated efforts in Congress and elsewhere to have the law amended. He knew that, as it stands, it is against his practices. He knew to what penalties he was exposing himself and his fellows. He gloried in the fact that he might have to go to jail. To show the real issues involved, we have only to imagine the reception of the news that the heavy hand of the law had so been laid upon Rockefeller or Harriman. There would have been an uproar of delight. It would have been said that no man had been found powerful enough to defy with impunity the law of the land. But that is precisely what Gompers set out to do. Boasting himself the head of 2,000,000 laborers, he dared the courts to touch him. No capitalistic magnate ever assumed a more insolent port, and none ever more richly deserved punishment. We may add, however, that we have no wish to see him imprisoned, provided the ends of justice can be compassed, and the needed salutary lessons brought home, in other ways. No one desires to make a martyr of Mr. Gompers, or to give him the slightest chance to complain that capitalistic violators of the Sherman law are not punished by being sent to jail for contempt. We should all much prefer to see him become a law-abiding citizen. It is idle for him to talk about the right of free speech being impaired. He is not sentenced for criticising the court, but for disobeying its order. He may rail at the law as much as he pleases, but he must not violate it. The thing to be aimed at is, not the punishment of Mr. Gompers, but the ending of the tyranny and illegal oppression of boycotting, of which he stands as head and front.

The chance that Ohio may be represented in the United States Senate by a man like Congressman Burton must make honest Pennsylvanians look at that State with envious eyes. For to Pennsylvania's shame, it seems certain that Boies Penrose will be reëlected. A less useful member is not to be found in the Senate; in his personal characteristics and in his policies, political and commercial, he belongs to a bygone age—the days of Quay and Hanna. He is a reactionary of reactionaries, a man of good family and traditions who has deliberately turned his back upon training and antecedents to descend to the lowest plane of Pennsylvania ring politics. He is himself unfit to hold any office; so far as his influence goes, it is a trifle better than Platt's and a little below Depew's, to whom he is politically a full brother. Senator Penrose is the head of the corrupt and infamous old Quay machine, which is in politics solely for money-making and office-brokerage.

The expected election of Secretary Root to the Senate is already said to have disturbed that body, because it seems to necessitate a change from the rule of rating a man according to age, to rating him according to ability. By the inexorable custom of the Senate,

Mr. Root would have no better chance than the rawest man from Nevada; he would have to go to the foot of unimportant committees, and wait for time and death to promote him. But in the case of a man like Mr. Root the system seems too absurd. The advantage of having him on the Foreign Affairs Committee is obvious; yet that position is usually one of the prizes of long service. Similarly, Mr. Root's fruitful labors in the War Department would seem fairly to dictate his assignment to a place on the Military Committee; but here again the same difficulty arises. The discussion of the matter only shows what a good thing it is to have a system, but how bad a thing it is to let a system strangle you. No doubt, the law of seniority is, on the whole, useful. But there are at least two occasions when it should be set aside: one is when, in Lord Rosebery's phrase, seniority spells senility; and the other is when a junior in point of service has had so much experience elsewhere in the kind of work to be done, and has shown such talent in it, that not to utilize him would be a thing not only ridiculous in itself, but an outrage upon the public.

Nearly sixty counties of Ohio have voted out the saloons, by an average majority of close to one thousand. Nine counties have voted "wet," mostly by very small majorities. The campaign has demonstrated that the opponents of prohibition have no class of voters, outside those directly concerned in the traffic, upon which they can absolutely depend. The mining districts in counties like Perry, Hocking, and Athens were regarded doubtful, but the miners themselves furnished a heavy "dry" vote, as did also the laborers in many of the smaller manufacturing centres. It was supposed that the farmers could be much influenced by the fear of increased taxes if the $1,000 saloon license should be given up, but the farmer vote invariably goes heavily against the saloon. The rapid spread of the trolley has made the farmer's boy more than ever a frequenter of the town, while the increased tax has driven the saloon in the smaller places to a more vigorous quest than ever for profitable trade. The connection of the saloon with gambling and with immoral women as profitable adjuncts, has made the danger to the unwary boy from the farm much greater than was encountered in the average drink-shop of a generation ago. The large German element in the rural population of certain counties was expected to oppose prohibition, but only in a few localities has the expectation been fulfilled. Nor has the temperance wave been broken in those sections which habitually give Democratic majorities. The "dry" list now contains something like half the counties which returned majorities for Judge Harmon a few weeks ago, including Monroe, which has never gone Republican in its history and which yet went "dry" by nearly 1,200. In the Seventeenth Congressional district, with a Democratic majority of over 7,000, every county but one has voted "dry" by a good majority, and that one is almost wholly "dry" already under the former township option law. The river towns were to be adverse, but twelve of the fourteen counties touching the Ohio have declared themselves "dry." It is now freely predicted that the next Legislature will submit a State-wide prohibition measure to popular vote.

The result of the November examination for consular positions indicates the need of making a complete break between politics and the diplomatic service. The examiners complain about the "discouraging lack of suitable material for appointment to the student interpreter corps and, in a less degree, the lack of good candidates for the consular assistant corps." Last July only nineteen out of seventy-one candidates endured the test; in November twenty-three out of fifty-eight. Such a poor showing, doubtless, reflects to some extent upon the intellectual equipment of young Americans. Too much familiarity with foreign languages and international law must not be expected from college boys. But the chief difficulty is touched in the examiners' remark:

> It seems impossible to obtain the men absolutely required without drawing upon States already over-represented in the service.

So long as consuls are picked according to geography, good material will be scarce. Wyoming will always have proportionately fewer young men with the training and inclination for the foreign service than New York.

The Hon. Timothy L. Woodruff, clearing-house for places of honor and profit under all State officers except Gov. Hughes, will find his duties slightly contracted as a result of the latest civil-service revision. Ten places within the gift of Mr. Woodruff's clients have been removed from the exempt to the competitive class. He may find consolation, however, in the fact that most of the 299 other positions placed within the competitive class have hitherto been in the hands of the Governor. Consolation, but also astonishment and contempt. For a man who would just throw away the disposal of three hundred offices must always remain a puzzle to the mind which figured out that the renomination of Hughes would spell defeat for the Republican ticket. With President Roosevelt taking the postmasters out of their reach and the Governor hacking away at their State patronage, the politicians confront an increasingly bleak prospect, while all good citizens rejoice.

Only a few days ago Austria was reported as well on the way towards a reconciliation with Turkey. There was to be an indemnity for the annexation of Bosnia-Herzegovina—the sum of $20,000,000 was mentioned—Turkey was to discontinue the boycott against Austrian importations. But, according to the latest dispatches, Austria has changed her mind. There is to be no indemnity. In Bosnia the Austrian army of occupation enters on another of those phases of "alarming activity" which it has been assuming so frequently of late, and Europe is presumably approaching another deadlock. Nevertheless, it is difficult to discern any very heavy war clouds. In undiplomatic terms, Austria's latest move may be described as largely a bluff. That game would be quite a safe one to play at the coming of winter, even if any of the Powers most closely concerned were anxious to fight; but Turkey, Russia, Italy, and France all wish to avoid war. The chances are that, ultimately, Austria will pay an indemnity. It is inconceivable that a European conference shall meet without allowing Turkey compensation for her lost provinces. The Russian Minister of Foreign Affairs has hinted that the conference might concern itself with the kind of government Austria shall erect in the annexed provinces; but Austria, once having made Bosnia-Herze-

govina her own, would naturally refuse to allow any interference with what would become an internal affair of the Empire. The Balkan States may be placated with this or that bit of territory. But so far as Turkey is concerned, she can be granted no other than a pecuniary satisfaction. Upon that she may reasonably insist.

But if for the moment Austrian diplomacy may play fast and loose with Turkey without seriously affecting conditions in the Balkans, the effect is quite different on general European politics, and specifically on the future of the Triple Alliance. Here the attitude of Italy is of primary importance. Italy's feeling has changed materially in the course of the last ten years. She joined the Triple Alliance out of fear of French aggression. She now has a good understanding with France. Conversely, her sentiment for Austria-Hungary, which has never been anything but dislike, has been growing more bitter. Italian ambitions concerning Trieste and the Adriatic coastland have been one cause of irritation. Recurrent conflicts between Italians and Germans in the Tyrol and other Austrian crownlands have been another. At the conference of Algeciras in 1906, Italy ranged herself on the side of France and against her allies, Germany and Austria-Hungary. In a conference about Bosnia-Herzegovina she is sure to play a rôle even more distasteful to Austria. Only a few weeks ago, a former Italian prime minister declared, in the course of debate, that Italy must henceforth arm, not against France, but against Austria. The Parliament cheered him, ministers embraced him, and Premier Giolitti shook hands with him in congratulation. True, the Chamber approved the foreign minister's formal declaration that Italy continued her adherence to the Triple Alliance; but the real spirit of the nation had been sufficiently shown by the preceding demonstration. In the strain it puts on the Triple Alliance, rests one of the dangers of Austrian policy in the Balkans. Dissolution of the Triple Alliance is, of course, not imminent. Germany would not allow such a thing to come to pass; and even Italy will perceive that, hate Austria as she does, it is better, for the time, to have her as an ally than as an avowed enemy. But the strands that bind the Triple Alliance are being cut one by one. Italy is not only on friendly terms with France, but she is on the point of concluding an arrangement with Russia. Within Austria, the danger is recognized, and there are protests against Baron von Aehrenthal's policy of needless irritations.

The world hears but little nowadays of Russia and her domestic troubles. Apparently, the revolutionary movement has come to a standstill, and the reactionaries are once more securely in control. But that is a wrong idea. On December 9, the St. Petersburg morning newspapers recorded seventeen executions and thirty-seven death sentences as the harvest of the day before. That may be called making a wilderness and calling it peace; but Russia cannot be spoken of as pacified. With thirty-seven death sentences recorded on a single day, it is evident that revolutionary forces are still active. Could the official statistics of the incessant blood-letting be compiled, the world would be aghast, particularly as there have been so many "executions" of which the official world has wisely taken no cognizance. Sooner or later, it would seem as if there must be a more violent explosion than heretofore; human nature cannot endure violent repression and injustice of the kind that is now the lot of the Russian people.

That the Russian Jews are still being persecuted appears from the news that the anti-Jewish agitation in Finland is becoming more and more serious. For some days past dispatches have reported that the Russian authorities in Finland are driving Jews from their homes into the fields to starve and freeze, and that the Finnish Legislature has promulgated an edict prohibiting the slaughter of meats in accordance with the Jewish ritual. If not all the blame must be awarded to the Russians it is, of course, plain that the Russian authorities, who have subjugated Finland with such an iron hand, will not object to anti-Jewish brutalities on the part of the Finns themselves. They are willing to aid in the persecution by forcing young Jews into the army, and, after the expiration of their term of service, preventing them from returning to their homes. The American-Jewish Committee again expresses the hope that American financiers will refuse to make loans to Russia and thus help to bring outside pressure to bear upon the Russian Government. We heartily wish it were practicable to focus an outraged world's opinion upon the Czar and his autocracy, for we are convinced that such an action would be in the interest of Russia herself.

REFORMS FOR INDIA.

The dispatches from Madras this week report the deep satisfaction of the Indian National Congress with the plans of the British Cabinet for reforming the system of governing India. This news will be very gratifying to the Viceroy, Lord Minto, and to Lord Morley, Secretary of State for India. In the face of unrest and sedition and spreading assassination, they have persisted in their determination to give to India a larger measure of self-rule. They have done this, too, despite something like a panic dread of a new Mutiny, despite protests against a policy of conciliation, and a powerful demand that a sufficient number of Hindu Nationalists be blown from the guns to teach the others submission. Hence it must give both pleasure and hope to those responsible for order in India, to learn that the National Congress, representing educated aspiration, receives their proffers with enthusiasm.

The speech in which Lord Morley laid his project before the House of Lords on December 17 was at once weighty and eloquent. The biographer of Burke dealt with his vast problem in something of Burke's largeness of spirit. It was a statesmanlike thing to announce liberal plans of reform and concession, at the very moment when bomb and dagger were making the faces of Englishmen in India blanch. Lord Morley's speech, with his outline of proposed legislation, was intended primarily for India to hear. To get his needed authority, he must wait till the next session of Parliament; but he would not wait to let his policy be known. He would yield to no administrator in the rigor with which he would put down mobs and anarchy; but he said he was "sick of all the retrograde commonplaces about the weakness of concession to violence, and so on." The government was simply persisting undismayed in reforms to which it had publicly set its hand. To keep on in your chosen course, undeterred by an occasional explosion of

picric acid, is "simply standing to your guns."

The phrase is happily borrowed, when a Liberal statesman takes it from the mouth of repression to use it in defence of conciliation and enlargement. There is such a thing as great firmness in placatory measures, and iron constancy in the pursuit of healing legislation. The government of India, under the direction of two such men as Minto and Morley, is to-day giving a lesson to all the world—to Russia and Turkey, yes, and to the United States—in the wisdom of joining indomitable courage with unconquerable leniency. On the one hand, it deals out speedy justice to the native murderer; on the other, it opens the door of self-rule to native leaders. Lord Morley spoke as a man having no illusions on the subject of severe punishment of political crime, by magistrates armed with extraordinary powers. It was a procedure hateful yet necessary. "There are situations in which a responsible government is compelled to run these risks." And the Secretary for India declared that the list of crimes, showing an anarchic conspiracy in India, justified the resort to a Summary Jurisdiction Bill, though it might be made an instrument of despotism. "I deplore this necessity," said Lord Morley, "but we are bound to face the facts." But he was just as positive in asserting the need of at once taking steps to meet the natural and legitimate desires of the people of India. In a fine passage, which we would commend to those who believe in doing brutal things in order to "impress the Oriental imagination," Lord Morley said:

> A number of gentlemen of whom I wish to speak with all respect addressed a very courteous letter to me the other day that appeared in the papers, exhorting me to remember that Oriental countries inevitably and invariably interpret kindness as fear. I do not believe it. The founder of Christianity arose in an Oriental country, and when I am told that Orientals do not appreciate kindness and are only influenced by fear, I will say that I do not believe that any more than I believe the stranger saying of Carlyle that, after all, the ultimate question between any two human beings is, Can I kill thee or canst thou kill me? I do not agree that any organized society has ever subsisted upon either of those principles or that brutality is always present in the relations between human beings.

We can but mention the chief heads of the reform proposed for India. The entire plan will be under debate in Parliament next spring. There is to be, first of all, an increase in the number of Legislative Councils. In these local bodies, there is to be "due representation of the different classes of the community." These Legislative Councils are to be empowered, besides dealing with local affairs, "to discuss matters of public and general importance, and to pass resolutions." There are also to be Councils for the Lieutenant-Governors, as well as the Viceroy; and the right to discuss and vote upon financial projects is to be given to both. The representation of natives is everywhere to be enlarged. The details are yet to be worked out, but the whole plan, as unfolded by Lord Morley, is far-reaching and prescient. It clearly looks forward to the day when education and a free press in India shall have done their work, and brought the people from the fifth century into the twentieth. Then it will be no more surprising to read of an Indian Parliament than it is to-day to read of the Russian Duma or the Parliament in Constantinople.

THE PHILIPPINE REPORT.

It is, perhaps, not to be expected that the report of the brigadier-general in charge of the Bureau of Insular Affairs (dated October 31, 1908, but just published) should be as interesting as reports which issue direct from the Philippine Commissioners. Yet so scanty is the news, official or unofficial, which comes from the islands that the words of Gen. Edwards deserve careful consideration for the light they throw on our progress in civilizing the Filipinos.

Primarily, Gen. Edwards is interested in the material development of the islands. There are the railways, for instance, upon which the government has guaranteed 4 per cent. to the investors. For them, Gen. Edwards is convinced that the future is very bright. In the Orient, he says, two-thirds of the income from railways is usually from passenger traffic; and since he is able to prove that the density of population in Cebu is 336 per square mile, as opposed to 152.6 in New York, and since the figures in Panay and Negros are also very favorable, "no reason appears why these three Viscayan lines should not pay a fair interest on the investment above the 4 per cent. guaranteed." This is delightful official optimism, since it brushes aside with a stroke of the pen all such things as the habits, customs, likes and dislikes of the populace, and the question of rates. It is gratifying to know, however, that the work of construction goes steadily on. More than 210 miles of new road have already been built in Luzon; in Panay forty miles from Iloilo north are open for construction operation, and nearly sixty miles are finished in Cebu. Authority has been given to extend the railway to Bagnio, in Benguet, the "summer capital" of the Philippine government, but despite the offer of the costly highway to Benguet as the roadbed, no one has yet been found ready to bid.

Another undertaking which has been put through by government credit is the Agricultural Bank. Private capital "hesitated to enter"; but, with the consent of the Attorney-General of the United States, the Philippine Commission appropriated one million pesos from the general funds as the capital of the new institution, and embarked in the banking business. On October 9 the first loan was made—to an American farmer of Tarlac province. Gen. Edwards thinks it "beyond question" that this bank will do much to restore and promote agriculture in the islands. Another government institution, the postal savings bank, has been in operation since October, 1906, with 245 branch offices and deposits of 1,031,994 pesos. Of the 7,346 persons who have made deposits since the beginning of the bank, 44.84 per cent. are Filipinos; and since the Filipino depositors, for whom the banks were primarily established, increased 10 per cent. in the second year, Gen. Edwards regards the outlook as "encouraging."

So far as trade statistics are concerned, Gen. Edwards cannot make out any great advance in prosperity for the islands, or show that the United States is making much money out of them. The exports of the islands fell short by $896,790 of their value in 1907, because of the decline in the price of hemp. Of the total exports, valued at $32,816,567, $10,323,233 went to the United States—a smaller figure than for any year since 1902. The imports were estimated at $30,918,357, of which only $5,079,487 came from the United States. It is not surprising, therefore, that Gen. Edwards earnestly urges the passage of the bill now before Congress to put on the Philippine free list agricultural machinery and implements, and to reduce

the rate on mining machinery, now 10 to 20 per cent., to a flat rate of 5. Naturally, Gen. Edwards favors also the reduction of duties on Philippine exports to this country, urged on Congress by Mr. Taft and President Roosevelt, for upon these exports the real prosperity of the Filipinos now depends. Finally, he shows that the expenditures of the Philippine government were $36,500 greater than the revenue.

Beyond this, he has practically nothing to report. To his superiors Gen. Edwards left all discussion of the general welfare and progress of the natives. But even in the President's message, the place assigned to the Philippines was after the Census, the Soldiers' Homes, and the Government Printing Office, and the space allotted to it shrank to insignificant proportions. There was praise for the official work done in the Islands, and for the admirable bearing and record of the native Philippine Assembly. The Secretary of War, however, fails to mention the Philippines; they have passed wholly beyond his ken, although the Bureau of Insular Affairs is under his direction. In short, in official eyes, the Filipinos now appear to rank in interest with Highways in Alaska, National Cemeteries, and the Boundary between Mexico and the United States, and stand far below the arming of the militia and the building of new battleships. Yet it was these same Filipinos who were to quicken and reform our entire political life, to purify our public service, and relieve us from too close observation of such purely parochial questions as Trusts, corporation control, and railway rates. But if we may believe unofficial reports, the Filipinos hate us worse than ever; they would rather be uncivilized than uplifted by the Americans; and their hopes, aims, and ideals all have to do with cutting loose from the United States.

A NICELY-TIMED REVOLUTION.

A woman with a "great peard" could have seemed no more suspicious to Sir Hugh Evans than will the Venezuelan revolution to a skeptical world. The *émeute* has so often been turned into a revolution in Carácas, that the steps in the process are now well recognized. One of the first of them is the destruction of the statues, or busts, of the President. Erected to himself by himself as the well-deserving saviour of his country, they are torn down as the effigies of a hated tyrant and traitor. This was done in the case of the famous Venezuelan Dictator-President, Guzman Blanco. And shortly after Castro sailed for Europe on November 24, his bust in the Concordia Club was pulled down and smashed to pieces. This was a sure sign of what was to come.

It would appear that President Castro has studied the career of his notorious predecessor, Blanco, to good advantage. That other dictator fled to Paris only after a revolution; Castro, being like the colonel in the story "a little lame," started early and got away before the revolution broke. Whatever else may be said of him, it cannot be charged that he is lacking in astuteness or in knowledge of his own people. It must have been the case, therefore, that when he abandoned Venezuela for Europe, he knew that he might never return—except, possibly, after a counter-revolution, some years hence. It must have become clear to him that his course as the unspanked boy of international relations was about run. Having insulted every nation with which Venezuela had anything to do, he thought it time to go. There can be no doubt that he had been prudently laying up treasure for himself in the European heaven, and where his treasure was, there was his heart also. He has almost certainly gone in imitation of Guzman Blanco, to be one of the South American "rois en exil" in Paris. At all events, we may be sure that the revolution in Carácas was no surprise to him.

Neither was it apparently, to the diplomatic world. The promptness with which the foreign representatives in Venezuela have begun to do business with the new government, shows that they were not exactly stunned by the suddenness of the upset. They acted, rather, like men who had their instructions in their pocket, written in sure anticipation of the event. It was no secret at Washington, last spring, after our diplomatic deadlock with Venezuela had become complete and Congress had washed its hands of the affair, that the State Department was approached to discover whether its attitude towards a Venezuelan revolution would be "benevolent." Of course, Secretary Root let it be known that this government could countenance no movement of that kind. Still, it somehow got about that we at least would not interfere to prevent such a nicely timed uprising. So little by little the stage was prepared for the comedy. As Castro left the scene, exiled generals began to return, and asphalt *concessionnaires* hovered in the wings. The battleship Maine, followed by the cruisers, sailed from our shores almost before the curtain went up in Carácas. There was, to be sure, no such stage mismanagement as occurred during the famous Panama revolution, when the ships got off before any news came, and a nervous Acting-Secretary cabled to Panama to ask if any hitch had occurred in the uprising. In Venezuela, however, the time had come for a revolution. If one did not exist, it would have to be invented. And the inventors appear to have been thoroughly convinced that they would not lack the approval of foreign nations.

In all seriousness, the advent of a new régime in Venezuela cannot fail, for a time at least, to make for the peace and comfort of the world. The series of affronts to other countries, of which Castro had been guilty, and the absolute impossibility of getting him to accede to the ordinary and peaceful methods of diplomatic adjustment of controversies between nations, had resulted in an intolerable situation. It had to be dealt with by force, somehow, and it is much better that the force should have been applied from within than without. Already the revolutionary government is coming to terms with Holland, having rescinded the order forbidding the trans-shipment at Willemstad of goods destined for Venezuela, and the Dutch warships are to be withdrawn from the coast. Other outstanding difficulties will probably be settled before long. It is to be hoped that our State Department will not take advantage of the somewhat precarious position of the new President to press him beyond reason in the asphalt matter; but that a settlement of long-standing disputes may be reached, satisfactorily and honorably to all concerned, now seems much more likely than it did a month ago.

THE GROWTH AND ISOLATION OF GERMANY.

The German Empire, within an area not so large as Texas, contains 63,000,000 people. At the present rate of increase, in forty years the population will amount to 100,000,000. The Germans have almost ceased to emigrate: for a number of years past the country has had more immigrants than emigrants. In this state of things, the public men of Germany cannot help looking ahead to the time, and that perhaps not remote, when the German people will feel a compelling need to overflow somewhere.

One naturally shrinks from contemplating the possibility of an armed movement eastward, the only direction in which the Germans can hope to expand in Europe. That would be a revival in the twentieth century of the *Drang nach Osten* which, in the tenth century, impelled King Henry the Fowler, at the head of the Saxons, Franks, and other German tribes, to undertake to push back the tide of Slavdom which in the great migration of nations had rolled westward as far as the Elbe and the Thuringian Forest. To the east, the Germans have not been able altogether to hold the ground that they have won. Time was when Russia was ready to take as many Germans as were willing to come, and there are not far from two millions in the various parts of the Czar's dominions. But the German no longer finds Russia to his liking; neither does Russia want him. The rôle of the Teuton as civilizer of the Muscovite is ended. Russian industry, mining, and agriculture, together with the Russian universities, have learned to do without him. No Peter or Catharine invites him to take up his abode in the realm. The Baltic Provinces of Russia, where the Teutonic Knights and the Knights Swordbearers spread Christianity and *Deutschtum* with fire and sword in the thirteenth century, are steadily losing their importance as northern outposts of German power. The Lett has dared to assert his nationality against the land-owning Teuton.

In the struggle for supremacy between Slav and German in Bohemia, the country which witnessed the foundation of the first German university in 1348, the balance is shifting in favor of the sturdy and versatile peasantfolk of the Czechs, who are increasing in numbers faster than their more civilized neighbors. In Carinthia and Carniola the Slovenes are vigorously holding their own, and in Galicia it is the Jew, and not the German, who to some extent disputes the ground with the Slav. The lands of the Hungarian crown contain two million Germans, but in spite of the ties that bind this kingdom to Austria, the percentage of German-speaking inhabitants is steadily diminishing.

It is not a cheering spectacle for the German patriot as he views, in the face of the waxing population, power, and splendor of the Hohenzollern realm, the waning of the German influence beyond the borders of the Empire. Still more is he depressed when he turns his gaze from Europe to other continents. He cannot help realizing that his long-cherished dream of a world-pervading *Deutschtum* is dissolving into an empty vision. As he surveys the map of the globe, instead of an advance he sees a positive retrogression. Less than a generation ago he beheld millions of Germans settling in the United States, which they were helping mightily to build up, cherishing their mother tongue, and not altogether unwilling, as he imagined, to remain linked by filial bonds to the fatherland. Others were making their way to the fertile plains of Canada. The map of southern Brazil was thickly sprinkled with German names. As for the Germany of the West, which was springing up on the soil of the American Union, it will ere long be nothing more than a reminiscence. The German colonies, which have blossomed within the last eighty years in the Brazilian States of Rio Grande do Sul, Santa Catharina, and Paraná, have likewise been sent adrift into the world by the almost complete stoppage of immigration; and, although the Teuton will not readily fuse with the Latin, the dream of a Little Germany beyond the equator will have come to nought.

Moreover, the stream of emigrants from Germany to Australia, which at no time reached large dimensions, has, in the last few years almost completely dried up, and practically no beginning has been made of German colonization in the Australasian and Polynesian islands. While the Germans have played such an extraordinary rôle in the exploration of Asia and Africa, there is hardly a German-speaking child to be found throughout nearly the entire expanse of those two continents. The author of the article "Deutsches Volk," in Meyer's "Konversations-Lexikon," has to admit that outside of Transcaucasia and Palestine there is but one German settlement in the whole of Asia, that at Tsing-tow. He complains that even the building of railways by German companies in Asiatic Turkey brings no German colonists in its wake. No kind of pioneer life seems any longer to have any attraction for the dweller between the Rhine and Memel. The "Statesman's Year-Book" for 1908 says that on an average just one person a year migrates from Germany to Asia. The writer in Meyer claims but 4,000 German-speaking inhabitants for the whole of the German colonies in Africa. The German absolutely refuses to go to Africa, and there is therefore no prospect of colonial development for Germany in that quarter of the globe. The rest of the world is preëmpted.

The German Empire is naturally restless under its political isolation. The Anglo-Saxon is controlling the destinies of a large part of the globe; the Latin of a not much smaller portion; the Slav has appropriated one-third of the largest continent. The German holds sway merely within a territory but little larger than the land of his ancestors nearly a thousand years ago. This condition of affairs is due in part to the fact that Germany is paying now the penalty for the state of things under that strange political fabric known as the Holy Roman Empire. Then the maritime power of the nation was parcelled out among a group of city republics, united in the Hanseatic League, but incompetent to engage in any national enterprise, while Spaniard, Portuguese, Hollander, Frenchman, and Briton, had both the energy and the facilities for taking possession of distant continents and islands.

THE OLD PROFESSOR.

The old professor is going; if he will not go, he is being sent. A fortnight ago, according to the newspaper dispatches, the regents of the University of Minnesota ordained that all contracts with members of the faculty shall expire when teachers reach their sixty-fifth birthday. Next June, it is said, half-a-dozen old gentlemen will call the

class roll for the last time, unless they have already followed the example of their president, Dr. Northrop, and sent in their resignations. What Minnesota has done others are doubtless contemplating seriously. The world is for youth, and youth is not for elderly scholars who can no longer appreciate the humor of throwing chalk across the lecture-room.

But will a fixed age-limit rid the schools of senility? Set sixty-five as the deadline, and the most obnoxious of all old professors will continue to fill chairs; we mean the kind that enters upon its dotage at the age of fifty, the premature fossil whose joy in life is dead, whose sympathy for ambition and ideals has gone cold, or whose mind sluggishly revolves, like an airless satellite, around a single idea. If the age-limit will not surely work, an endurance test might. Make every professor over forty pass an examination in lecturing, and "flunk" the man whose students fall asleep. Lead the faculty on a long jaunt through contemporary affairs, and give a passing mark only to those who are running strong at the finish. So long as one has no prejudices against mere years, this plan might do admirably.

The very week when Minnesota ordered off its sixty-five-year-olds, the distinguished French economist, statistician, and administrator, Prof. Émile Levasseur, was rounding off the fortieth year of his connection with the College of France, his fifty-fifth of teaching, and his eightieth of life. Academic Paris, led by the Minister of Public Instruction, turned out to do him honor; and nobody suggested that M. Levasseur might best show his gratitude for this display of public appreciation by resigning. The French are notoriously parsimonious; they believe in getting all the profit they can out of an investment, be it a cabbage-patch or a professor. They take especial pride in the venerable *administrateur* of the College of France, therefore; he is, as the *Temps* says, the greenest, liveliest, busiest old man ever seen, always ready to go to distant congresses and never overcome by the longest debates, the richest banquets, or the dullest addresses. So long as he can hold the pace, nobody is going to stop him. Two days before his anniversary, a correspondent found him in bed dictating letters and articles to a secretary. He was not ill; oh, no! He never felt better in his life. But there were some extra lectures to be prepared for the following week, and he wished to be fresh for the *petite fête* on Sunday.

Age, after all, is a relative disability. A more troublesome question is the retirement of teachers who can no longer teach. Too little thought has been brought to bear on the existence of four distinct species of old men and the four distinct problems they present. There is the old man with failing body and failing mind; we need not tarry long over him, for he usually retires without pressure. Then there is the old man with strong body and weakening mind; the old man with frail body and sturdy mind; and the rare old man of M. Levasseur's stamp, whose mind and body are both young. How shall we deal with these three? It is not enough to get rid of the first, even at the price of losing the other two. The ripe old teacher is a college's most valuable asset. He keeps alive respect on the part of young men, and also the finest traditions. Sometimes his own traditions are turned against him; a college in the front rank of progress, it is said, cannot tolerate exploded ideas. But an alert mind which can defend even antiquated thoughts vigorously will keep students in the attitude of inquiry and restrain a few from rushing after hot-waffle theories that are served on every corner at a penny a-piece—and well-sugared. And when these antiquated notions happen to be unfashionable truths, he who does battle for them is the happiest of our warriors. He should not be forced to lay down his arms while his strength lasts.

If he is a Levasseur, the retiring board should find him no problem at all. But the normal type is the professor whose physical frame cries for rest long before his mind. It is cruel to keep him at the mill of daily lectures; it is both cruel and wasteful to cut him off from work he loves. Some intermediate status between *ordinarius* and *emeritus* seems called for. In Europe and our own most richly endowed universities it has been partly realized; the old professor with many assistants can reduce his class work to a minimum. But even that may prove too much. Could he not be made a kind of consulting professor? Let him be to the college what the consulting engineer, the consulting surgeon, and the consulting attorney are to their professions. Send students, and also professors, to him for advice. That would give the old professor an abiding interest in life. Isn't he entitled to it?

"ROBINSON CRUSOE" FOR GROWN-UPS.

"Robinson Crusoe," in two handsomely printed volumes, with reproductions of the popular Stothard plates, has just been issued by the Houghton Mifflin Co. The publishers explain that, although the work "has never failed to make a powerful appeal even to the most sophisticated readers," it is "not at present readily obtainable in fine, adequate literary form"—that is, apart from sets of Defoe's works. The venture will, we hope, prove successful; for it is true that "Robinson Crusoe" is generally printed in a cheap style with coarse illustrations for children; and that most adults, having read and reread the story in youth, seldom return to it. If this edition finds for it new friends and tempts the oldsters to renew their acquaintance with it, the publishers will have deserved well of the republic of letters. For we are confident that any man who has not touched "Robinson Crusoe" since he was fifteen, will, on taking it up again, be surprised and delighted to discover the range and the interest of that wonderful tale. True, it lacks the love-making which, modern critics assure us, is of the essence of good fiction, at least in the opinion of women; but surely that defect may be forgiven, as we forgive it in Stevenson's "Treasure Island," and "Kidnapped." We grant also that there are *longueurs* in the action, passages of rather tedious dialogue and moralizing. Through these a boy blithely ploughs, usually without either edification or distress; but any adult who has mastered the art of reading (which, rightly viewed, is the art of skipping) may pass them at a jump. Moreover, the "Further Adventures," like most sequels, is a falling off. With these provisos, we assert that the life of Crusoe on his island is good enough entertainment for anybody; in its class it is supreme.

Frederic Harrison's praise of it (in "The Choice of Books") is sufficiently enthusiastic, but in our view rather misses the main point:

"Robinson Crusoe," which is a fairy tale to the child, a book of adventure to the young, is a work on social philosophy to the mature. It is a picture of civilization. The essential moral attributes of man, his innate impulses as a social being, his absolute dependence on society, even as a solitary individual, his subjection to the physical world, and his alliance with the animal world, the statical elements of social philosophy, and the germs of man's historical evolution have never been touched with more sagacity, and, assuredly, have never been idealized with such magical simplicity and truth. It remains, with "Don Quixote," the only prose work of the fancy which has equal charms for every age of life, and which has inexhaustible teaching for the student of man and of society.

Our quarrel with Mr. Harrison relates not so much to what he says, as to his emphasis. For a man of philosophic temper "Robinson Crusoe" may be all that he says it is—a work on social philosophy and a picture of civilization. He who can read in the apparently casual act and trifling incident the wide-sweeping laws of human action and the organization of society, will find abundant food for reflection in Crusoe's entire helplessness without the product of the labor of others—the guns, saws, clothing, and food which he brought ashore from the wreck; and, in the final building up of a busy little community with the aid of Friday and the castaways. But it is not to be supposed that Defoe was moved by any desire to expound what we now call theories of sociology: his aim was to tell a good story; and, because he made it so true to life, we can discern in it all sorts of profoundities which we dignify by such terms as historical evolution.

The idea which we urge is that "Robinson Crusoe," though it may be a work on historical evolution and social philosophy, is much more than that. Social philosophy, for those who want it, may be had from many sources every day in the week. Mr. Harrison, himself, has offered us a good deal of it; and in this country Professor Giddings is an unfailing spring of it. But neither of them could write "Robinson Crusoe." We hold, rather, with Charles Lamb that "all ages and descriptions of people" may "hang delighted" over the adventures of this sea-rover and practical man of affairs. As a piece of characterization, he is fascinating—to men, but not, we regret to say, to the ladies. He is no figure of romance, like Launcelot; he could never play the languishing lover; he lacks the attractions of a Don Juan. But, though he could not pose as any of these accomplished wooers whom women think so delectable, he would be an admirable husband. Without a trace of the subtlety or exacting taste of Henry James's creations—hard men to live with—without that instability which we politely call temperament, he is the model of a solid, steady man. He would do his best for the wife of his choice; he would never be ruffled by her shifting moods; and as a "good provider," in the old New England phrase, he would be incomparable. On that slender ground we may commend him to the suffrages of those for whom novels are chiefly written. But what we like most about Crusoe is the fine stoicism with which he inflexibly faces the world as it is. Heat and cold, hardship, sickness, and peril that would shatter the mind and body of ordinary mortals leave him unshaken, unafraid, and ready for the duty that lies next his hand. No character in the range of fiction has a better right to quote those lines by Henley:

> I am the master of my fate;
> I am the captain of my soul.

But aside from the character of the protagonist, the incidents form an absorbing and often thrilling tale. It is nearly two centuries since the book first appeared. There have been innumerable imitations in many languages, but the most accomplished practitioners have failed to reach the level of the great original. We have just been turning the leaves again, to be struck once more by the freshness and vitality of this narrative. Dip into it almost anywhere and you are tempted to read on and on, and renew your vanished youth. There is the escape from the Moor at Sallee and the voyage with Xury, the vivid account of the shipwreck, that wonderful cave with the stockade about it—can the wit of man conceive a more attractive dwelling?—the making of the earthen pots, the building of the big boat, the cruise about the island in the little *periagua*, the discovery of "the print of a man's naked foot on the shore," the fight with the savages and the rescue of Friday—how captivating it all is! Merely to glance at the familiar pages strikes thirty years off the reckoning. The roar of the street traffic dies away in our ears; the stock-tables in the newspapers and the dispatches from Washington are forgotten. This hard practical world is transfigured into a land of romance: with Crusoe and Friday we are creeping through the woods to surprise the cannibals and save their European captive; in breathless suspense we are levelling our muskets, and—by heavens!—the other prisoner is Friday's father!

NEWS FOR BIBLIOPHILES.

Although the fact is not stated in the bibliographies, collectors and dealers are generally aware that the colored plates in "Damascus and Palmyra," by Charles G. Addison, Bentley, 1838, were by Thackeray. It is not so commonly known, however, that, while most copies have ten plates only, some copies have eighteen. The drawing is not like Thackeray's later work, and the proof that he was the artist lies, we believe, solely in the fact that the receipt for payment in his autograph is extant. This document, which was inserted in Augustin Daly's copy of the book, reads as follows:

> Received of C. G. Addison Esq're twenty pounds for illustrations &c to his work on Damascus & Palmyra. W. M. Thackeray
> £20: 00: 0
> London, 22 December 1837

This brief memorandum unfortunately does not give details as to the number of plates. In the hope that some information may be gathered from owners of copies of the book, we give a list of the titles of the eighteen plates as found in two copies examined, with an asterisk prefixed to those which are found in the copies with ten plates only:

> Vol. I—*Dancing Dervish, Greek Peasant, Turkish Recruit, *Arabat or Turkish Ladies Carriage, *Turkish Lady, *Dancer at the Cafés, Musician of the Harem, *Muezzin Calling to Prayers, Turkish Gentleman.
> Vol. II—*Scene in the Bazaar, Egyptian Soldier, Syrian Merchant, *Bon Bon Seller, An Eastern lady Waiting on Her Guests, *Damascene Lady, *Sherbet Seller, The Bedouin Sheikh, *Lady of Damascus.

The entire eighteen are uniform in style of drawing, execution, and lettering. Each has the lithographer's name "Modeley lith. 3 Wellington St. Strand," below the plate, in a curve. It has been suggested that the extra plates might have been inserted from a book published in 1814, "Picturesque Representations of the Dress and Manners of the Turks," but a comparison shows that execution and lettering are different. Thackeray had not visited the East in 1837, and he might have got ideas from this book or other books on Eastern costumes. The private collector who now owns the Daly copy also owns a water color, representing some Oriental officer or notable standing by a chair, signed "W. Thackeray, Dec. 5, 1836." This was submitted to Mrs. Ritchie, Thackeray's daughter, some years ago, and she wrote: "I have little doubt that it is my father's." This drawing is dated a year earlier than his receipt for £20 from Addison, but it seems not improbable that it was made for that work, but for some reason found unsuitable, and so never reproduced.

In Johannes Wegeler's "Die deutsche oberrheinische Type (M44) im 15, und 16. Jahrhundert" we have the first study of a single "Haebler" type in all its variations.

Not less than 134 varieties of the general type are tabulated, and the variations of each letter are described with great minuteness. Dr. Wegeler's study is a further development of the "natural history" method of typographical investigation, which was first tried by Henry Bradshaw, and which has already resulted in the determination of the origin of many incunabula. The present study will in all probability be followed by others, and if each "Haebler" type be taken up in this way, the time will not be far away when it will be possible to determine the origin and perhaps even the dates of most incunabula with incomplete imprints. The volume is published in Haebler's Sammlung bibliothekswissenschaftlicher Arbeiten (Leipzig: Haupt).

The Milton Exhibition at the Grolier Club will continue until January 9, and should be visited by every one interested in seeing the largest collection of engraved portraits of Milton ever brought together. Three hundred and twenty-eight portraits are shown, 150 more than in the Milton exhibition at Cambridge, England, last summer. These engravings for the most part are derived from a few sources, of which the following are the more important:

The portrait painted by Cornelis Janssens, showing Milton, at the age of ten; first engraved by Cipriani, 1760.

A painting by an unknown artist, formerly in the possession of the Onslow family, and known as the Onslow portrait; engraved by George Vertue, 1731.

The engraving by William Marshall, 1645.

Faithorne's engraving, 1670. This print, the first published as the frontispiece of Milton's "History of Britain," is the best of the old portraits. It was frequently copied and sometimes altered.

Engravings after or influenced by the "Baker drawing," owned at one time by the Tonsons, but now lost.

Engravings after or influenced by the "White drawing," also lost.

Portraits founded upon busts, medallions, seals, etc.

A further class includes portraits from various spurious or doubtful originals. Of these no less than ninety are included.

The exhibition contains first editions of all of Milton's poetical works as well as most of the prose, besides later editions. The original printer's copy of Book i of "Paradise Lost," thirty-three pages small quarto, which belongs to J. P. Morgan, is also shown. Though not in Milton's autograph it is almost certainly the manuscript which was written down by his daughter from his dictation, and is, with the exception of the volume of poems in Milton's autograph, known as his commonplace book, which belongs to Trinity College, Cambridge, the most valuable Milton memorial in existence.

The Grolier Club has just distributed to subscribing members the edition of "The Scarlet Letter" which has been under way for a long time. The book is a large octavo, and one of the most perfect specimens of printing ever done at the DeVinne press. There are thirteen full-page plates from drawings by the late George H. Boughton, almost his last work. These have been printed in colors in Paris by a new process not used before in any book published in this country. Three hundred copies have been made, besides three copies on Japan paper. Of these three, one is reserved for the club library; the other two will be offered to the members at auction at the annual meeting in January.

On January 4 and 5, Stan. V. Henkels of Philadelphia, will sell that portion of Judge James T. Mitchell's library which includes works on engraved portraits, the finest collection, probably, dispersed at auction in this country. This forms the eighth part of Judge Mitchell's print collection.

On January 7 and 8 the Anderson Auction Co. of this city, sells a private library including some important books, among them Smith's "History of Canada" (1815), 2 vols.; Holbrook's "North American Herpetology" (1842), 5 vols.; and an album containing sixty-four drawings by F. O. C. Darley, for the illustration of the works of Cooper and Irving.

From January 18 to 28 Dario G. Rossi of Rome, will sell the library of the late Duc D. Mario Massimo. The collection is chiefly remarkable for the large number of books of predictions or prognostications, more than a hundred titles being catalogued under this heading, thirty-one of them printed before 1500.

Correspondence.

THE ORIGIN OF THE LAND GRANT BILL.

To the Editor of The Nation:

Sir: There is a growing consciousness on the part of people interested in education that the Morrill land grant act of 1862 will prove to be one of the most important steps ever taken in any country in the direction of public endowment of higher education. With the growing prominence of the institutions which owe their origin to this land grant act, is coming of course an increasing interest in everything relating to the early history of the movement which culminated in this celebrated act of legislation.

I am very desirous of ascertaining the exact facts as to when and by whom the proposition was first made for a Federal grant of land in support of an institution or institutions in each State and Territory in the Union for the development of agriculture and the mechanic arts. The claim has been made at various times that Senator Morrill was the first man to make a proposition of this sort, as he was certainly the man whose active support was of great service in securing the passage of the law with which his name is connected. This claim does not seem, however, to be fully substantiated.

The first proposition which I have been able to find looking toward Federal support for the endowment of colleges for agriculture and the mechanic arts, upon the basis of a land grant made to each State in the Union, was in the form of resolutions adopted at a farmers' convention held at Springfield, Ill., June 8, 1852. In a memorial addressed to the Legislature of Illinois, the desire was expressed for such action on the part of the Legislature of Illinois as would assist in securing "an appropriation of public lands for each State in the Union for the appropriate endowment of universities for the liberal education of the industrial classes in their several pursuits in each State in the Union."

At a similar convention held at Springfield, January 4, 1853, a memorial was adopted addressed to the Senate and House of Representatives of Illinois to the effect that they present a united memorial to the Congress now assembled at Washington "to appropriate to each State in the Union an amount of public lands not less in value than $500,000, for the liberal endowment of a system of industrial universities, one in each State in the Union, to coöperate with each other and with the Smithsonian Institution at Washington for the more liberal practical education of our industrial classes and their teachers in their various pursuits, and developing to the fullest and most perfect extent the resources of our soils, our arts, the virtue and intelligence of our people, and the true glory of our common country." A petition to adopt these resolutions was sent to the Legislature of Illinois, and resolutions to the above effect were adopted by that body February 8, 1853.

That this action attracted general attention throughout the country among the people interested in the development of public education is evidenced by an article in the semi-weekly *Tribune*, New York, March 1, 1853, p. 2, col. 1, in which the resolutions of the Illinois Legislature above referred to are printed in full, with the following comment, possibly by Horace Greeley himself:

Here is the principle contended for by the friends of practical education, abundantly affirmed with a plan for its immediate realization, and it is worthy of note that one of the most extensive of the public land or new States proposes a magnificent donation of public lands to each of the States, old as well as new, in furtherance of this idea. Whether that precise form of aid to the project is most judicious and likely to be effective we will not here consider. Suffice it that the Legislature of Illinois has taken a noble step forward in a most liberal and patriotic spirit, for which its members will be heartily thanked by thousands throughout the Union. We feel that this step has materially hastened the coming of scientific and practical education for all who desire and are willing to work for it. It cannot come too soon.

The Senate Journal of the Thirty-third Congress, first session, p. 269, under date of March 20, 1854, notes that these resolutions above referred to were presented to the Senate in the form of a petition by the Hon. James Shields, Senator from the State of Illinois, and referred to the Committee on Public Lands.

All this would seem to indicate that the credit for the first distinct proposition to develop a series of institutions for the higher liberal and practical education of the people in each State of the Union upon the basis of a Federal land-grant, belongs to the farmers of Illinois. The resolutions were presented to the Farmers' Convention by a committee of which Jonathan B. Turner, once professor in Illinois College at Jacksonville, was chairman.

The first bill incorporating this provision was introduced into Congress, if I am correctly informed, December 14, 1857.

Can any students of our educational history point to any earlier formulation of this proposition? Edmund J. James.

Urbana-Champaign, Ill., December 18.

"MUGWUMPS."

To the Editor of The Nation:

Sir: In your notice of the last instalment of the "New English Dictionary" (December 17, pp. 601, 602), you cite "Mugwumps"

as used for "dukes" in Eliot's Indian version of the Bible, 1653. In "A Key into the Language of America," written hy Roger Williams while on his journey to England, to procure the first charter for Providence Plantations, and printed in London by Gregory Dexter in 1643, we find

"Keénomp } pañg. Captaines, or Valiant men."
Múckquomp }

AMASA M. EATON.

Providence, R. I., December 21.

KNOWLEDGE OF MILTON IN EARLY NEW ENGLAND.

TO THE EDITOR OF THE NATION:

SIR: The conclusion reached in my communication printed in the *Nation* of Decemher 24, that the American allusions to Milton there given were helated, turns out to he correct. In his "Pietas in Patriam: The Life of His Excellency Sir William Phips, Knt." (1697), Cotton Mather writes (Section 10, p. 31):

They found, that they were like to make no Weapons reach their Enswamped Adversaries, except Mr. *Milton* could show them how

To have pluckt up Hills with all their Load,
Rocks, Waters, Woods, and by their shaggy tops,
Up-lifting, bore them in their hands, Therewith
The Rebel Host to'v over-whelm'd.

These lines, somewhat altered hy Mather, are from "Paradise Lost," vi, 644-647. The "Pietas in Patriam" was included hy Mather in his "Magnalia" (1702), where the ahove passage will be found in Book ii, p. 47. In the same work (Book vii, pp. 44, 50) Mather quotes from "Paradise Lost," vi, 483-490, and vi 386-392, in one place changing Milton's "Chariot and charioteer" to "Salvage *and* Sagamore." These allusions were pointed out hy Mr. C. W. Ernst in the Boston *Evening Transcript* of Decemher 23.

ALBERT MATTHEWS.

Boston, December 26.

ARNOLD AS ANTIDOTE.

TO THE EDITOR OF THE NATION:

SIR: As an answer to your editorial of Decemher 24, "After the Higher Criticism, What?" pray print Arnold's sonnet, given below. That is the antidote—the consolation. All the underlined words are in italics in my edition—the definitive edition of 1895. S.

New York, December 25.

THE BETTER PART.

Long fed on boundless hopes, O race of man,
How angrily thou spurn'st all simpler fare!
"Christ," some one says, "was human as we are;
No judge eyes us from Heaven, our sin to scan;

"We live no more, when we have done our span."
"Well, then, for Christ," thou answerest, "Who can care?
From sin, which Heaven records not, why forbear?
Live we like brutes our life without a plan!"

So answerest thou; but why not rather say:
"Hath man no second life?—*Pitch this one high!*
Sits there no judge in Heaven, our sin to see?—

More strictly, then, the inward judge obey!
Was Christ a man like us? *Ah, let us try*
If we then, too, can be such men as He!"

[This citation from Arnold admirahly illustrates our point that the progress of the Higher Criticism seems to leave only the stoics unscathed. It seems hardly possible, however, that the gospel according to Matthew Arnold can in the minds of the rank and file make any such appeal as the gospel according to Matthew has made through eighteen centuries.—ED. NATION.]

THE BIBLE AS THE WORD OF GOD.

TO THE EDITOR OF THE NATION:

SIR: In your editorial entitled "After the Higher Criticism—What?" (*Nation,* Decemher 24) you appear to assume that the so-called higher critics have robhed the Bihle of the divine authority which it was formerly held to have. It appears to me, however, that modern criticism, as Canon Driver (among the foremost of modern critics) affirms, has done nothing to invalidate the Bihle as the word of God and the infallihle rule of life; and that its divine character, though hidden from the wise and prudent, is manifest to the simple who order their lives hy its teaching.

CHARLES H. MOORE.

Cambridge, Mass., December 27.

THE DUTY ON MATERIAL FOR FERTILIZERS.

TO THE EDITOR OF THE NATION:

SIR: I have just seen your issue of Novemher 19, in which, discussing the hearings before the Ways and Means Committee, you say (p. 477):

George R. Bower of the Henry Bower Chemical Company of Philadelphia likewise confesses that fertilizers are profitably manufactured in this country, and yet he wants more protection in order to get still greater profits.

It is quite evident to me, in reading this, that you draw your conclusions from the garhled newspaper reports of my hearing, which appeared after I made my verhal statements. The fact is that neither I nor my company is interested in fertilizers in any way, and I made no recommendations whatever concerning them. As a matter of fact, the recommendations I have made are, for the most part, merely to the effect that present ad-valorem rates be made specific on the hasis of present values.

It is hardly consistent with the standing that you claim for your puhlication to attempt to hang your "clear-cut political criticisms" on newspaper inaccuracies. The dignity of your journal and a desire to deal justly with the ohject of your criticism, it appears to me, should call for greater care in your editorial columns. You will recollect that the programme outlined for the Committee on Ways and Means is to revise the tariff from the protectionist's standpoint. If you will take the trouhle to read the printed reports of the hearings, which also contain copies of the hriefs submitted by the various interests that have heen heard, you would find that all recommendations, in the chemical industry, at least, have been of a most moderate character and well supported hy facts and logical arguments. I would appeal to you to suhstitute for the spirit of carping criticism you display, an exhibition of a spirit of fairness that should prevail in all discussions in a puhlication of the character of the *Nation.*

GEORGE R. BOWER,
President of the Henry Bower Chemical Manufacturing Company.

Philadelphia, December 19.

[We must plead that if we make any comment on current events, we are generally hound to follow the press reports. The printed stenographic reports of these sessions of the Ways and Means Committee did not appear till some days had elapsed. On consulting them, as Mr. Bower suggests, we find (p. 22) that Mr. Bower asked that the present duty be retained on sulphate of ammonia, a material used in the manufacture of fertilizer. We reprint (p. 24) the following stenographic report of the close of Mr. Bower's testimony:

Mr. Bower. We manufacture all of the articles which I have mentioned.
Mr. Underwood. You have been ahle to manufacture them successfully under the present tariff?
Mr. Bower. Yes, sir.
Mr. Underwood. What reason can you assign why we should increase the tariff?
Mr. Bower. We could make more if we could secure more of the market.
Mr. Underwood. It is not for the protection of your industry that you desire the increase, hut it is purely a question of increasing the profits of the manufacturers?
Mr. Bower. Yes, sir; that is what it hoils down to.
Mr. Dalzell. You think the duty you suggest would he prohibitive?
Mr. Bower. Yes, practically so.
Mr. Underwood. Where do you expect the government to derive any revenue if you have prohihitive duties?
Mr. Bower. There are a great many articles subject to the tariff that have to he imported. There is no necessity of importing things that we can make here, so far as I can see.—ED. NATION.]

REFLECTIONS ON THE ELECTION.

TO THE EDITOR OF THE NATION:

SIR: Would it he amiss hefore turning hack to the daily routine to spend another quarter of an hour in considering somewhat more carefully the significance of what happened at the polls the other day—the causes and the reasons, and the prospects to which we are for the present shut in? Clearly it was an event over which thinking people should not play the blinkard; for some of the questions now for the moment gone out of discussion will return again to plague us, and none of them ought to he thought settled, or, indeed, can he, if not disposed of in accordance with the actualities.

To begin with, as to the broad fact of the overthrow of the Nehraskan, how can it he said with so much assurance, how can it he said at all, that it was due, as many people appear to imagine, altogether or chiefly to a popular conviction of his instahility? Whether indeed he is unstable, this is a point upon which I make no argument. I would simply say that it is a point upon which much has heen said that is not persuasive. But is it not plain that enormous influences have been at play, some of which, at any rate, have little more than an incidental relation to the character of candidates, good or bad? For one thing, is it not plain beyond cavil that vast numhers of voters, voters who, of whatever age, are not yet grown up, are still in the inflamed stage of Rooseveltism? How else shall we understand the amazing dumhness with which the man in the White House was suffered to dictate the nomination and to use the powers of government openly, boldly, wholesale, to carry nomination into election? Here was an influence powerful enough, perhaps, augmented with the jingo fervors that everywhere go with it, to account for everything that happened.

But more powerful even than this, more powerful, I believe, than all else, was the influence of money. I do not refer to the campaign fund, although a fund running into the millions seems a strange enough thing in a land where there are people who look about supperless for a bed that cannot be found. If political truth were carried home to some one man somewhere, preferably a tributary farmer in darkest Vermont, the expenditure might not be regretted. But I do not refer to this. I mean the unhappy power over the minds and lives of men generally of the thought of personal monetary gain, or the fear of personal monetary loss.

Let us consider, for a moment what has been growing and unfolding before us along with what we fondly call our prosperity these recent years—a society in which the material good is not merely the highest good, but the *All*. Let any one recall for a moment the odds and ends of talk he has been everywhere hearing—on street cars, on railway trains, in the corridors of hotels—floating scraps of the common thoughts of men, thoughts of which the ways of getting and of spending have been the endless theme; consider for a moment the men, all of whose powers one knows to be bent not on noble living, not on life in which the truly good things have the foremost place, but on the amassing of fortunes and luxuriating in them; consider the thousands upon thousands whom these schemers employ and exploit; consider the other thousands who hang upon the fringes of this eager life and subsist as they can! And consider the indisputable revelations of unscrupulous eagerness which have been unrolled before us—of bankers banking with one foot on the threshold of the jail; of men everywhere, thieving legislators, defaulting trustees for widows and orphans running neck and neck from a justice which sometimes pursues, but seldom overtakes! What more natural in a society so prepossessed, so overwhelmed by a desire for the shining metal, whether to hoard or to spend, than that money should be more powerful than all else in determining the votes of men? What more natural than that the election should stand first of all as good evidence, or not evidence, but proof, of what money, wealth, consolidated capital can do for itself when it is owned or controlled by persons who are mainly of one opinion as to where their interests lie, and who work single-mindedly to promote them?

We are so accustomed to the material, the money-material, point of view, that the concentration of attention upon this point has been little noticed, but the conservative press has teemed with arguments having no other bearing, and the platform has resounded with them. Where will you find your profits? Where lie the dollars? Has the voter a good place at a good salary? Then he must vote for the good old Republican régime and prosperity, and so keep it and better it. Is he the father of a family, and possessed of hands only as a means of their support? Then he may vote for Bryan, if he like; but in that case the mill will shut down, or wages will be cut.

What more natural than that the real questions now long before the country should receive no real consideration—that voters should really not ask themselves whether the tariff was an economic folly and a political peril? Nor whether war or the machinery of war is a dispensable evil? Nor whether we stultified ourselves before a cyuical world when we set up to govern the Filipinos as a subject people, and ought now to establish them in independence. Nor even what should be done as to the Trusts and other great monopolistic combinations by which a free political life is visibly threatened? The question the voter was induced to put to himself was the unmixed and immediate question of money. A sordid question, sordidly and dishonestly put and sordidly and not very honestly answered. Sordidly and dishonestly, but also ignorantly and mistakenly. The mill would not have been shut down, or, if shut down, it would have been started again on a more equitable footing. If the protected mill owner cannot have a tariff under which he can make a rascally fifty per cent. all for himself, he will still go on and take his ten per cent. and let other people, perhaps his own employees, have the other forty. Wages would not have been cut, or, if they had been cut, the prices of the necessaries of life would have been still more cut.

What more natural, what, indeed, more inevitable, than that years upon years of steady attention to what they call the "main chance" should come to precisely such results? People seem to have no difficulty in perceiving that a man cannot play Shylock all the week, and be heart and soul in the beauty of holiness all Sunday, but they are virtually told that they can spend over and over their three years and eleven months up to their necks in the not over-clean activities of mere money-getting and in the remaining four weeks examine with the prepared mind and deliberately settle great complex questions of mixed political justice and political expediency not only for themselves, but for generations yet to be born.

RACHEL EDGEMORE BURLEIGH.

Madison, Wis., December 15.

Notes.

The index of the *Nation*, July 1 to December 31, will be printed with the issue of January 7.

The publishing department of Paul Elder & Co. will in January return from New York to its home office in San Francisco.

T. Fisher Unwin of London announces for early publication a book on "The Panama Canal and Its Makers," by Dr. Vaughan Cornish. The engineering problems of the work are here considered, and also the bearing of the canal on the future of the white races in the tropics.

The Oxford edition of Thackeray is completed by the issue of four volumes (XIV to XVII), which contain "The Newcomes," "Henry Esmond," "The Adventures of Philip," and several of the minor works. Professor Saintsbury continues to discourse prefatorially in his jaunty vein of the books and the characters that live in them. He is a convinced Thackerayan, naturally, but he does not hesitate to put his finger on the weak joints here and there of the novels. "Esmond" is evidently his favorite; "one of the furthest explorations that we yet possess of human genius," he reckons it, "one of the most extraordinary achievements of that higher imagination which Coleridge liked to call *escnoplastic*." More interesting than such laudation, however true, is his analysis of the autobiographical hypothesis into its three elements, Esmond being Thackeray "himself and 'the other fellow,' and also, as it were, human criticism of both." One point Prof. Saintsbury does not bring out, nor does any other critic, so far as we remember; that is the fact that these memoirs are supposed to have been written by Esmond for the perusal of his wife, and are colored throughout by this personal relation. Thackeray never forgets this, and in many places allows the reader to get glimpses between the lines of the state of affairs as they really were, and not as they are presented for the eyes of the jealous wife. With this point in mind we should hesitate to say quite so emphatically as does Professor Saintsbury that "Harry had been in love with the mother, as well as with the daughter, all along." The tragedy of the book is deeper than it at first appears—though deep enough under any light. Its burden, shown in many aspects besides the final marriage, is the difference between the ideal love of beauty and the inevitable compromises of life, and its solution is the philosophy of victory through resignation. Professor Saintsbury has much to say also on "Philip" and "The Newcomes" that might suggest comment. "The Newcomes," he thinks, must be the most popular of Thackeray's novels, and himself ranks it higher in the scale of excellence than we at least are inclined to admit. Despite its marvellous scenes and still more marvellous character sketches, "The Newcomes" has always seemed to suffer from one essential weakness; it is a novel not "without a hero," but that hero, Clive, is uninteresting. In this respect the book falls far below "Pendennis." In fact, it seems to us demonstrable that the greater novels, with the exception of "Esmond," which stands apart, degenerate in value in the order of publication, "Vanity Fair," "Pendennis," "The Newcomes," "The Virginians," and "Philip." And the reason no doubt is that Thackeray, like a good Englishman, depended too much on the spontaneity of genius, and rather despised the laborious lessons of art.

To its green and gilt bound series the Oxford University Press has added three volumes of exceptional interest. One is John Galt's delightful "Annals of the Parish," a perfect example of dry Scotch humor. Another contains the "Select Poems of William Barnes," with an introduction by Thomas Hardy. Barnes has had the good fortune to win the applause of two famous lovers of his Dorsetshire—Hardy and Lionel Johnson, and his homely pathos and beauty will have a charm for any reader who can surmount the first repulsion of the Wessex dialect. The third volume is "Echoes from the Oxford Magazine," printed from the second (1890) edition. It is a book of academic humor at its best, a worthy continuation of Calverley, a rich and fine growth which has never taken root on this side of the Atlantic, though Dr. Holmes sometimes came close to it. Some of the best pieces in this collection are parodies of Tennyson and Swinburne and others by Q. (Mr. Quiller-Couch), a clever skit on "The Art of Bowling" written as a Socratic dialogue by C. T.—but all the pieces are so good that there is little choice, and, besides, they are prob-

ably already known to the reader of this note.

"The King's English," which we noticed editorially July 12, 1906 (p. 29), has been reduced to something less than half its original bulk, and so issued by the Clarendon Press as a schoolbook. The omissions are of non-essentials and scarcely diminish the value of the work. As we remarked of the original edition, no one can acquire the positive qualities of style by reading such a manual, but one may be warned of many faults. The book is an excellent example of its class, and there are few writers who would not be improved by going through it carefully.

Little, Brown & Co. have gathered the "Poems and Sonnets" of the late Louise Chandler Moulton into a volume, for which Harriet Prescott Spofford has provided a preface of glowing eulogy. Mrs. Moulton's verse suffers somewhat from reading in mass; its saccharine taste becomes cloying after a while, and the eye begins to run forward at each new elegy to catch the word "moan." But taken singly or in small groups many of her pieces undoubtedly possess a rare beauty, rising in a few of the sonnets and at least in "Laus Veneris" among the poems to something very near the sublime.

The "Poems" of E. C. Stedman in a standard series published by Houghton Mifflin Co. emphasizes the fact that this genial critic and poet has laid down the pen and taken his reward. We have no intention of attempting to characterize Mr. Stedman's verse. Its qualities are well known. His best work, of serious vein, is found, we think, in the poems written to commemorate great names or important events. Here, without reaching too strenuously after the exalted, he assumes easily a grave and pleasant dignity.

Copies of the "Facsimile of the MSS. of Milton's Minor Poems, preserved in the Library of Trinity College, Cambridge," may be obtained of Bowes & Bowes of Cambridge, England. This is a volume of collotypes privately printed by A. G. Dew Smith in 1889, and shows clearly the complicated corrections of the poet.

Now is the season when annuals of various sorts make their appearance, and among the first of these and the most generally useful is "Whitaker's Almanack" for 1909, published by Joseph Whitaker of London. The present edition has undergone considerable rearrangement, which was made necessary by the introduction of a number of new topics. Some notion of the wealth of material included may be gained from the fact that the index contains more than 6,000 references.

The "Almanach de Gotha" for 1909 also makes its appearance (imported by Lemcke & Buechner), with its usual genealogical and political information. The engraved portraits this year are of the King and Queen of Sweden and the Duke and Duchess of Baden.

The fourth edition of "Wer ist's?" for 1909 appears promptly, coming to our table from G. E. Stechert & Co., the American publisher. About 2,000 new biographies are included, and the type of almost the whole work has been reset, giving a clear impression. The volume has grown so large that the editor will soon be compelled, as the editor of the English "Who's Who" found it necessary, to banish the preliminary statistical tables and other miscellaneous matter to a separate volume. One of these additions, however, is highly useful for those who would consult such a book, containing a list of some 3,000 pseudonyms. Continual use has only brought out more clearly the fulness and excellence of this publication. The only difficulty it presents is the severe abbreviation of the titles of books, but the names of German books are commonly so long that some such compression was necessary for saving space. As it is, the present issue runs to 1,626 pages.

A. & C. Black have added to their series of illustrated description books a handsome volume, "The Isle of Wight" (imported by the Macmillan Co.). The narrative by Hope Moncrieff bears the respectable and unexciting character that one would expect. The colored illustrations by A. Heaton Cooper are vigorous and interesting, though the color is not always convincing, while the artist's impressionism sometimes taxes the resources of reproduction.

Of "Travels of a Lady's Maid," by "A. B.," (L. C. Page & Co.), it may be said that while the travels are the well-known article that any one could dictate with his eyes shut, the lady's maid is of a type that never was on sea or land. The book abounds in the sort of English humor which it is admitted that Americans cannot understand, although it is usually as in the present instance, thoroughly explained and edited with a key attached.

In "From the North Foreland to Penzance" (Duffield & Co.), Clive Holland has amassed a sufficiently readable agglomeration of anecdote, description, moral reflection, and history bearing on the south coast of England. But the reason for the book's existence is to be found in the admirable illustrations by Maurice Randall. These are exceptionally artistic and effective instances of the three-color process, showing the great range of which that process is capable. Apart from their technical excellence, they have qualities of sentiment that will charm every lover of the characteristic sea-coasts of England, and the artist has anticipated with great tact the requirements of the method of reproduction. The painter and the printer must divide the credit for an achievement in the presentation of skies and sea stretches that marks high-water in the mechanical use of color.

W. H. Hudson's exquisite talent has won him a body of warm admirers, but the very nature of that talent, its restraint, its simplicity, its refusal to force the note, keep the body a small one. Those who hold "Green Mansions" among their chosen books will be glad to find in "The Land's End" (D. Appleton & Co.), although it is not a romance, the same power to observe and reproduce nature. "Green Mansions" presented the tropical forest as mere literature has hardly painted it elsewhere; this latest book uses a different palette altogether and gives us the water-charged atmosphere, the scanty, wind-tormented flora and the strong and struggling fauna (from men to adders) of the Duchy of Cornwall. Birds are Mr. Hudson's chief interest in life, but he conceives his subject in a large spirit, and as for instance the prevalence of Methodism in Cornwall bears indirectly but indisputably on the welfare of the birds, that and many other sociological phenomena come into his discussion. The book is profusely illustrated with half-tones and with line-plates in the text, well enough drawn by A. L. Collins, but rather coarsely reproduced.

The Rev. John P. Peters has published a pamphlet, "Hilprecht's Answer," in which he analyzes the contents of Prof. H. V. Hilprecht's volume, "The So-Called Peters-Hilprecht Controversy." Dr. Peters says:

This little pamphlet is intended both as a response to Hilprecht's answers, which seem to me, while attempting to evade the real issues, to be in fact an admission of substantially everything alleged by me, and also as a summary of the situation as it now stands. My hope is that, instead of controversy as to the past, we may now have an actual publication of the Nippur material in an orderly and scientific way, which will enable the world to ascertain precisely what was discovered, with proper identification of the provenance of each object. If this unsavory controversy shall end in such a good result, I shall be sufficiently repaid for my part of the pain and unpleasantness.

"The Control of Public Utilities," by William M. Ivins and Herbert Delavan Mason (Baker, Voorhis & Co.), gives the Public Service Commission Law of New York, together with the text of the Interstate Commerce Act and the Rapid Transit Act of New York, all carefully annotated, with citations of leading American cases. The whole is a bulky volume of nearly 1,200 pages, which, with its full indexes, cross-references, and judicial precedents, is itself an obvious public utility. As Mr. Ivins contends in the preface, there is no doubt that the movement to regulate public-service corporations by the several States is bound to have a wide extension and thorough trial. Acts modelled on the New York statute are almost certain to be passed in New Jersey and in Connecticut, within six months. To legislators, therefore, as well as lawyers, this work is of timely interest. On the chief legal points involved, judicial opinion is not yet fully crystallized. When the Supreme Court finally decides the Consolidated Gas case, it may easily be that a new judicial landmark will be set up, by which all future legislation of the kind will need to orient itself.

The American Academy of Political and Social Science, in consultation with the officers of the National Society for the Promotion of Industrial Education, has devoted the issue of its *Annals* for January to a discussion of industrial education in its different phases. This issue includes articles by Col. Carroll D. Wright, the retiring president of the society; M. W. Alexander, sometime its vice-president; Dr. J. P. Haney, secretary; John Golden, president of the United Textile Workers of America; W. B. Prescott, secretary of the International Typographical Union Commission on Supplemental Trade Teaching, Chicago; N. W. Sample, superintendent of apprentices of the Baldwin Locomotive Works, Philadelphia; John Wanamaker; Dr. Booker T. Washington, principal of Tuskegee Institute; and Frederick W. Atkinson, president of the Brooklyn Polytechnic Institute. Mr. Golden writes on the position of labor

unions regarding industrial education; C. W. Cross on the "Apprenticeship System of the New York Central Lines," and Mr. Wanamaker on "A Store School."

"The Gay Gordons," by John Malcolm Bullock (London: Chapman & Hall), is well enough described by the second title, "Some Strange Adventures of a Famous Scots Family." The author, who is engaged in editing a many-volumed history of the House of Gordon, has extracted from the "immense amount of material at [his] disposal" a number of highly picturesque characters and incidents and put them together "to illustrate some well-defined characteristics of the family." The most marked of these traits would seem to be that which has earned for the clan the title of the Gay, or the Gey, Gordons—according to whether the name is spoken by friendly or unfriendly critics—a certain dare-devil recklessness, leading them far afield as rovers of sea and land, soldiers of fortune, and champions of lost causes. To show how this wild strain in the blood turned the poor brain of mad Lord George, fed the fiery genius of Byron, and mingled hero and fanatic in the indomitable martyr of Khartum would be an interesting task, but Mr. Bullock has expressly chosen to omit the best known figures from his gallery, nor indeed would his hand be equal to any very subtle or valuable studies of character. It is more to be regretted that the regard for space which led him to strike out the greater names on his list did not hold him to a severer standard in dealing with the lesser; there is a good deal of genealogical dead wood, which would be better cut away. In spite of this, however, and of the author's slipshod style and commonplace ideas, the book contains much curious and enjoyable reading. The White Rose of Scotland who married poor Perkin Warbeck; the Great Glenbucket, crouching over his "little grey Highland beast" as he rides away from Culloden; the beautiful Sarah Lennox, she whom Thackeray paints for us making hay at Young George the Third on the lawn of Holland House; the silly, gallant lad who got himself beheaded (*guillotined* is surely a curious anachronism for 1769) at Brest as a spy—all these and many other picturesque, unlucky figures pass across the stage, but none stranger or more haunting than the last Earl of Aberdeen, the elder brother of the present peer. In January, 1866, this young man, no wild gallant, but serious, religious, well-educated, the head of his family, having already taken his seat in the House of Lords, left home forever. On May 22 he entered himself on the visitors' book at the Revere House, Boston, as "George H. Osborne," and for the remaining four years of his life he hid himself under that name and revelled in the hardships and adventures of an able seaman. He had risen to be first mate on a three-master sailing from Boston when he was knocked overboard one rough night in mid-ocean and never seen again. Of all the Gay Gordons, surely none has been truer to the blood, none readier to count the world well lost to satisfy an insistent craving of the spirit, than that blameless gentleman, the sixth Earl of Aberdeen.

The extraordinary vogue of "Rembrandt als Erzieher," which advocated the regeneration of Germany through her low-land peasantry, has been responsible for innumerable philosophical protests against modern educational methods in Germany. One of the most vigorous is August Horneffer's "Erziehung der modernen Seele," which seeks the remedy for the prevailing anarchistic tendencies in literature and art, not only in a return to Greek culture, but also in the lessons to be drawn from Chinese rigidity in moral instruction. The author apparently finds the antagonism between the educational ideals of Greece and China less irreconcilable than might be supposed. At any rate, in his opinion, both have led to important identical results—simplicity, sincerity, clearness. In China, "men live clearly and on solid ground." Herr Horneffer is less vague than most writers on similar subjects, but as in so many recent German books of this kind, sexual problems are needlessly dragged into the discussion.

"Die Erteilung der Doktorwürde an den Universitäten Deutschlands, mit Textabdruck der amtlichen Satzungen," by Dr. O. Schröder (Halle: Buchhandlung des Waisenhauses), hitherto published as one volume, is now issued also in four separate parts, giving the official data on the doctors' degrees in the theological, the law, the medical, and the philosophical faculties.

"Von Gott und Gottes Offenbarung" is the title of a new collection of sermons, from the point of view of advanced theology, by Julius Bode of Bremen, a recognized leader in the propaganda of adapting new theology to modern religious needs. He recently issued a similar work entitled "Im Lichte leben!" (Slade: Fr. Schaumberg).

The Waisenhaus Verlag of Halle has just issued two works in the field of Germanic philology. One is the third volume of R. C. Boer's "Untersuchungen über den Ursprung und die Entwicklung der Nibelungen Sage"; the other, Virgil Moser's "Historisch-grammatische Einführung in die frühneuhochdeutschen Schriftsdialekte."

An archæological work of interest has just come from the presses of the Dieterich'sche Verlagsbuchhandlung (Leipzig: Theodor Weicher), "Der kretische Apollonkult: Vorstudien zu einer Analyse der kretischen Götterkulte," by Dr. Wolf Aly. On the basis of recent research in the archæology of Crete, the author begins here an attempt to solve the Mycæno-Cretan problem. The special purpose of this brochure is to show that the worship of Apollo was introduced at a comparatively late period into Crete, and was there united with the worship of some of the older divinities.

The studies contained in the sixth part of Gustaf F. Steffen's "Sociala studier" (Stockholm: Geber) deal with some fundamental aspects of social theory. The central idea in these studies is that the economic civilization is not the aim of life, that this civilization is the means by which men in our day reach the *real* aim of life, namely a higher culture, ethical, religious, æsthetic, scientific. The way to realize this aim is in the direction of Socialism. On the specific socialistic movement, which is called Social Democracy, the author looks less critically than in 1900, when he published his work, "Lönarbetaren och Samhället," because, he says, "since then important progress has been made within the Social Democracy from the older Marxian dogmatism to a modern scientific view."

Under the title, "Dieci anni di Storia piemontese (1814-1824)," the Fratelli Bocca of Turin have just published for the Piedmont Committee of the Società per la Storia del Risorgimento, a volume which includes unpublished letters of Vittorio Emanuele I, Carlo Felice, Carlo Alberto, and others. The book is edited by a grandson of Gen. Alessandro Marmora, Count Mario degli Alberti, who has included a number of letters in the possession of his family, written by Carlo Alberto to the Marquis Carlo della Marmora, between November, 1821, and 1824, while forced by Carlo Felice to live in exile in Tuscany. The editor also reprints two memorials of King Carlo Alberto: that addressed to the Powers in 1821, entitled "Rapport et détails de la Révolution qui eut lieu en Piémont dans le mois de Mars, et détails sur ma Régence," and that of 1838, with the title "Relazione ad majorem dei gloriam." Among much that is trivial and tedious, these letters present this king, who has been called the "Italian Hamlet," as bearing ill fortune with cheerful fortitude, hoping, as he says, "that some day many people may become convinced that I have been strangely and unreasonably slandered in every way."

Under the direction of W. D. Johnston, its newly appointed librarian, the library of the United States Bureau of Education has during the past year undertaken some important new functions in behalf of educational workers and pedagogical libraries in this country. With a view to the improvement of the catalogues of pedagogical collections, the library began on January 1, 1908, to publish catalogue cards for current educational literature not copyrighted in the United States. These cards are printed and sold by the Library of Congress as a part of the service of its card section. As all books copyrighted in the United States are at present catalogued by the Library of Congress, it is now possible for librarians to secure printed cards for almost any current publication relating to education. These cards are also useful as announcements of current publications, constituting, as they do, the most complete record of current pedagogical literature which exists. During the coming year all cards made out in cataloguing the collection of this library, whether of old books or new books, will be printed, so that with the development of its collection and the completion of its recataloguing, it will become possible to secure from the library an exact description of any pedagogical work of importance, whether a current publication or not. The library has further undertaken the preparation of a union catalogue of the more important pedagogical collections of other libraries in the United States. Cards for books in this library and cards for books in other libraries are filed in one alphabet. This union catalogue should be useful to students wishing to learn where a rare book or edition may be found. It is also of particular use to this library in reducing to a minimum the purchase of duplicates.

At the meeting of the Archæological Institute of America at the University of Toronto, December 29, Prof. Henry A. Sanders of the University of Michigan pre-

sented his second report upon the Greek Biblical manuscripts brought from Egypt in 1907 by Charles L. Freer of Detroit (see the *Nation*, January 2, 1908, p. 8). The work of separating the leaves of the manuscripts, said Professor Sanders, has progressed satisfactorily during the year. The majority of the leaves separated have also been photographed, and the process of collation is being carried on. A facsimile of the manuscript of Deuteronomy and Joshua, now in preparation, will be first of the series to be published. The heterogeneous character of these four parts of one Bible is now even more manifest than at first. Comparison with numerous other manuscripts has made it clear that those in the Freer collection were written in lower Egypt at dates ranging from the fourth to the eighth century. Of greatest interest, not only palæographically, but for other reasons, is the discovery that near the middle of the manuscript of the Gospels there is a 16-page quire which is written in a hand unlike any that appears elsewhere in the manuscript, and upon a different kind of parchment, with a different sort of ruling. On the basis of the excellence of the text, the ancient appearance of the parchment the peculiar spelling, the character of the writing (resembling a papyrus hand), and evidence of transmission from a similar source in other parts of the manuscript, it seems probable that these sixteen pages once formed a part of the parent manuscript from which most of the text of John, Luke, and Mark in this manuscript of the Gospels was copied; the parent manuscript cannot be dated later than the fourth century. The whole of Matthew and probably some other portions were copied from a different manuscript having a text presenting a considerable mixture of Syrian readings. The ancient home of this Bible has been discovered through a new interpretation of the subscription at the end of the Gospel of Mark. This reads as follows: "O Holy Christ, be thou with thy servant Timothy and all his." The reference is to Saint Timothy, who was a martyred monk of Memphis; "all his" are the worshippers in his church, which was in the Monastery of the Vinedresser, a short distance west of the Pyramids. That monastery perished between 1208 and 1441 A. D., and probably this Bible was then transferred to another.

The Société des Gens de Lettres has announced its annual prizes: The Grand Prix Chauchard, 3,000 francs, to the novelist Camille Debans; two other prizes of the same foundation, each 1,000 francs, to Ph. Chaperon and Mme. Camille Pert; the Prix of the President of the Republic, 1,000 francs, to Jean Blaize; and the Prix Petit-Bourg, 1,000 francs, to Charles Diguet.

Charles Edward Phelps died in Baltimore December 27 at the age of seventy-five. He was graduated from the Harvard Law School in 1853, practised law in Baltimore, served in the Maryland Brigade of the Union Army, was elected to Congress in 1864 and to the Supreme Court Bench in Baltimore in 1882. He published "Juridical Equity" (1894), "Falstaff and Equity" (1901), and "One of the Missing" (1905).

The death is announced of Edmond Louis Stapfer in his sixty-fifth year. He was the oldest member of the Faculté de Théologie of Paris, and one of the most influential members of the Reformed Church in France. Besides a critical translation of the New Testament, he published "Les Idées religieuses en Palestine à l'époque de Jésus-Christ" and "La Palestine au temps de Jésus-Christ."

THE MISTRESS OF HOLLAND HOUSE

The Journal of Elizabeth Lady Holland (1791-1811). Edited by the Earl of Ilchester. 2 vols. New York: Longmans, Green, & Co. $6 net.

The Lady Holland chiefly known to us, the one presented, for example, in Mr. Sanders's recently published "Holland House Circle" (see the *Nation*. October 8, page 336), is the imperious hostess of the later years, in whose salon and dining room the recognized wits of London met to cross swords. The present handsome volumes give her under rather a new light. Beginning with June, 1791, when she left England with her first husband, Sir Godfrey Webster, the first part of the Journal carries the record through her five years of foreign travel. There is then an interval of a year, during which her first union was annulled by Parliament and she was married to Henry Richard, third Lord Holland. The second part of the Journal begins after this event and continues through the four years of Whig "Secession," until 1801. With the change in the nature of the Opposition there is a change in the Journal; the political events are followed with more historical regularity and less personal interest, especially during the Ministry of All the Talents, when Lord Holland was Privy Seal. After the fall of that Ministry the entries diminish in continuity, coming to an abrupt end in 1811.

The Journal thus divides naturally into three sections, of which the second is far the most entertaining. The earliest division is not without interest of a personal sort. Here and there a few words escape the diarist, showing her rancorous hatred of the dull squire to whom she was married at the age of fifteen, and who was totally unsympathetic to her vivacious temper and petulant vanities. But for the most part her Journal of travel is like that of any intelligent young woman—she was only twenty when she went abroad—and scarcely worth printing. With her marriage to Lord Holland, with whom she had begun to live before her divorce, all this changes. She was devoted to her new husband. Though always looked at askance by the more decorous ladies of England, she was set immediately at the centre of the society of Whig rebels, and her home became their meeting place for politics and recreation. Columns might be filled with anecdotes and sketches of character. Toward Charles Fox, her husband's uncle, she had that personal drawing which he won from almost all who came into contact with him, although her bitter diatribes against gambling show that she was aware of his weaknesses. She quotes, too, with approval the saying of the terrible Sir Philip Francis (whom she both feared and despised) that Fox was a man of "facility" without "cordiality"; but in his presence that facility had the power of genius. March 10, 1799, she writes of him:

> We sat up very late with him; his conversation is always instructive and entertaining. He shuns politics as much as I could wish. Criticism, literature, and observations upon character are the chief topics. It is astonishing what a storehouse of knowledge his mind is of every sort, from a fairy tale up to a system of philosophy. A novel was mentioned, upon which he launched forth upon a discussion on the different merits of the novelists, in which he displayed as great a range of reading as a miss who reads from a circulating library could do.

Of the other great Whigs Sheridan was evidently antipathetic to her. She disliked him personally and distrusted him politically. The best of her bonmots are already known from other diarists of the age, but we do not remember to have read this about Sheridan:

> There is a story of his offering some stories to Mr. Fox, to assist him in argument, but the latter, who is very strict as to what he asserts, asked if they were well authenticated, and, finding they depended upon report, declined using them; upon which S. said, "He is so d——d *surly about facts.*"

The most interesting figure, of whom we get only tantalizing glimpses, is Lord Lansdown (as the name was spelt by him), better known in history as Shelburne. Readers of Disraeli will remember his admiration for one whom he regarded as the most philosophical and least understood among English statesmen. Disraeli was drawn to Shelburne in part, no doubt, by the mystery that hangs about his character, and the uncertainty whether his pose signified profundity or concealed charlatanry. Perhaps, too, he had a natural sympathy for one about whom, to quote Lady Holland, "a simple, well-meaning man once said, 'What a pity 'tis that Mr. Fox has no private character, and Ld. L. no public one.'" What is told of him in the present memoirs will only cast another veil of obscurity about his character, but it will at least win sympathy for the man in his broken health, distrusted by his political allies, at war with his oldest son, living in a "vast solitude":

> Ld. L., in his old age, surrounded with dignities and wealth, is helpless, and more an object of pity than of envy. He has no friend. Col. Barré, who went through life with him, he has broken with; the cause of their quarrel is a mystery [always *mystery*]. He loves the society of women, and has lost two wives. His son, whom he

meant to make a tool for his ambition and to live over again in his political career, shuns the line he designed him for, and is an alien to his country. The character of his second son is not yet developed. His home is a vast solitude, and but for the three ladies must be insufferable. . . . He always makes me melancholy, to fancy the anguish he must at times endure. When he was in ministry many of the squibs of the day had compared him with the Jesuit Malagrida. Goldsmith, with his usual simplicity, said to him, "I wonder, my Lord, at their comparing you to Malagrida, for he was a very honest man."

In these chance notes of intimate characterization lies the chief interest of Lady Holland's Journal; her account of political movements is neither consecutive nor quite clear. As for her own character, she appears a woman lovable in many ways, excessively sociable, hating the country and clinging to the town, not yet imperious, though with signs of that coming trait. It is evident that her success as a hostess was in no small part due to her physical attraction to men. Hints occur continually of lovers at her feet, though, with the exception of her escapade with the man she afterwards married, it would appear that she herself, if flattered, was always perfectly discreet. In religion she belonged to the free thinkers of the day, and she has recorded a curious prayer in acknowledgment of recovered health, beginning: "Oh, God! chance, nature, or whatever thou art." On the whole, she must have been, even in youth, a woman not altogether easy to live with, and there is a satisfaction in thinking that she probably made her first husband, a man apparently of many contemptible qualities, as unhappy as he made her.

CURRENT FICTION.

The War in the Air. By H. G. Wells. New York: The Macmillan Co.

Mr. Wells tethers this nightmare almost at our doors. If this history written before the event proves sound, the present generation will live to see the heavens filled with navies "dripping death," and the nations disembowelling one another in universal war. The conflict is precipitated by the Crown Prince Karl Albert, an austere, dreamy-eyed military fanatic whose brains are addled by his "star," his ancestors, and the Imperial destiny of Germany. Believing that his aerial fleet will render him invincible, he sails over New York, demolishes it like an ant-hill, and establishes his base in the heart of the United States. It was a happy inspiration to present these tremendous affairs as seen by an unwilling passenger in the Prince's flagship—Bert Smallways, a droll, stupid cockney, formerly repairer of bicycles in Bun Hill. Bert is a rather rich, humorous creation. Stupid as he is, he is wiser than the lords of the earth—he is a kind of homely symbol of the pacific, humdrum common sense of the world. Through the dull opacity of his intellect one truth is as clear as noonday—the vast futility of war. Cornered by bloody circumstances, he blows the Prince to pieces with an explosive bullet, and thus, to a stray cat which he has befriended, moralizes the event:

> War's a silly gaim, Kitty. It's a silly gaim! We common people—we were fools. We thought those big people knew what they were up to—and they didn't. Look at that chap! 'E 'ad all Germany be'ind 'im, and what 'as 'e made of it? Smeshin' and blunderin' and destroyin', and there 'e is! Jest a mess of blood and boots and things! Jest an 'orrid splash! Prince Karl Albert! And all the men 'e led and the ships 'e 'ad, the airships, and the dragon-fliers—all scattered like a paper-chase between this 'ole and Germany.

There are suggestions here and elsewhere of the spectre-seeing Carlyle and his Merovingian kings—the solemn poetry of desolation and the ultimate vanity of human affairs. After the terrific helterskelter of world-wide conflict, modern civilization lapses into a kind of ghastly barbarism—the world "rambles into nothingness."

The familiar and vivid realism in which Mr. Wells's imagination garbs itself makes this wild romance impressive, and at times almost credible. It is an exciting tale, a novel military history, and a pungent fable for jingoes.

The Emotionalist. By Stanley Olmsted. New York: D. Appleton & Co.

The sub-title describes this book as "The Romance of an Awakening to Temperament." In the following pages, there is much incipient romance, and much attempted definition of temperament, but one is left on the last page, "tangled in prickly chromatics," still awaiting the awakening. Is the author indulging in Shavian merriment at the reader's expense by thus implying that so-called temperament (whether plain English or italicized and accented) is merely a recognition of the buttered side of one's bread? It is difficult to draw any other conclusion from the Furman's preferring an oil magnate to the operatic career for which she has already forsaken the tedious Aldrich. This ending is quite in harmony with a certain deliberate effort to astonish which, throughout the story, takes the place of orginality. We are prepared to distrust Miss Low as designing, and all at once a halo is clapped on her head and she stands forth a self-sacrificing saint. Figures are introduced with a flourish of trumpets and vanish into thin air having accomplished nothing but their entrance. Amid these alarms and excursions, one rests with a sense of security on the infinite lack of variety of the two principals, Aldrich and Victoria Furman. Even the generous use of local color fails to give them the illusion of life; beneath the make-up they have the lay-figure's unbewildering repose.

Friendship Village. By Zona Gale. New York: The Macmillan Co.

Friendship, as the author's note warns us, may be sought in vain geographically; but in the reader's heart-atlas it may readily be found in the same latitude with Cranford, Our Village, and Thrums. In all of them, one has the same warm sense of intimacy with real people whom one would gladly meet. The characters are like an orchestra, each instrument holding a part of its own, all interwoven to a harmonious whole; an orchestra of strings, be it added—for even the Proudfits' motor fails to introduce a note of brass. The story of the book stands secondary in interest to its philosophy, which is of the simplest and oldest in theory. It finds its clearest expression in the bits of homely talk that sweeten the pages like wayside flowers. With the wholesome pungency of humor that pervades the whole, the book cannot fail to find a welcome, though, as art, it falls short of the dainty distinction of "The Loves of Pelleas and Etarre."

The Expensive Miss Du Cane. By S. Macnaughtan. New York: E. P. Dutton & Co.

The house-party assembled at Hesketh —"a house where nothing very brilliant was demanded of its guests, and where the fatiguing exigencies of being 'fast' were unknown"—is, even more than the usual English country-house assemblage, made up of eccentricities. They are, in fact, so close upon caricature that if they were not exceedingly clever, they would be emphatically ridiculous. And yet before the visit is over there is hardly one of the party who has not shown a human feeling too genuine to be dissipated even by the dispersive breath of parody.

The hostess and two of her guests, however, stand quite untouched by exaggeration. The "episode in Miss Du Cane's life"—thus runs the sub-title—is of a pathetic sort, more rarely met in novels than either tragedy or the "happy ever after" of comedy. It recalls a little the ache of an old story of two generations ago—"A Last Love." The hero of Miss Du Cane's episode, to be sure, is not of the large nobility of that earlier blameless hero. It is perfectly easy to put the finger on Geoffrey Arkwright's weak spot. The point remains, however, that for all his weakness he is not quite a cad. Hetty Du Cane, in holding him guiltless of the charge of mercenariness, was not all feeble supineness. There is that mingling of reasonableness with wrong done which makes this world a coil, its simplest affairs the results of vast and com-

plicated forces, its judgments vain futilities.

The book thus furnishes both amusing and touching reading. The absurdities of a fussy host and a houseful of guests bent on amusement, yet kicking against the prick of organized entertainment, are enlargements of matters of universal observation. The penultimate chapter describing the pseudo wedding journey is pathetic poetry, pure and undefiled.

That Pup. By Ellis Parker Butler. New York: The McClure Co.

Mr. Butler's latest short story in book form is a very close variation on the theme of "Pigs is Pigs." There are, of course, a half-dozen pages that will bring a loud laugh. Mr. Butler's attempt to formulate a law of periodicity in dogs, based on the fact that one gun will send one dog into hiding for exactly forty-eight hours, is ingenious. On the whole, however, the fun spreads rather thin over sixty pages.

Round the Fire Stories. By Arthur Conan Doyle. New York: The McClure Co.

This volume is a collection of some seventeen stories which, as the author explains in a preface, "are concerned with the grotesque and with the terrible—such tales as might well be read 'round the fire' upon a winter's night." As is bound to be the case, the selections are uneven in quality, yet as a whole they attain in their kind a remarkably high level of excellence. Reading the volume cannot but strengthen one's conviction that Sir Arthur Conan Doyle possesses great versatility, ingenuity, and skill as a narrator. "The Leather Funnel," "The Beetle Hunter," "The Man with the Watches," and "The Japanned Box" are fair examples of the author's work. "The Pot of Caviare," "The Lost Special," and "The Brazilian Cat" are distinctly above the average, admirable bits of construction.

Letters and Memorials of Wendell Phillips Garrison: Literary Editor of the *Nation*, 1865-1906. Cambridge: Riverside Press.

Though this volume is privately printed, notice of it is fitting in a journal to which Mr. Garrison gave so largely of his life. In arrangement, form, and typography, it exhibits a taste which would have satisfied his exacting standards, while in the nicer matter of judgment concerning what to print, one would fain believe that even his fastidious pen could have found nothing here to strike out. The plan of the book is to give a condensed account of his outwardly uneventful life, a few personal tributes from men who knew him well, with selections from his letters to friends and contributors, closing with a few specimens of his published self-expression in verse, in articles, and in addresses. His friend and classmate. Prof. J. H. McDaniels of Hobart College, writes the sympathetic and adequate introduction.

The letters fill just over one hundred pages, and are singularly revealing of the man. If any regret is left with the reader, it is that more of them had not been collected, or printed. Mr. Garrison was a voluminous and conscientious letter-writer, in an age when that art had nearly expired, and it seems a pity that a fuller disclosure or illustration of his character were not available in the form of his correspondence. It is not a question of family letters, or of those written *intime* when sorrow ploughed him deep: such were inevitably kept back. There must be, however, multitudes of the letters of Mr. Garrison, the editor, still in existence. If one covets a larger selection from them, it is because those in this volume are so typical, and whet the appetite for more. They put before us the man in habit as he was. His infinite kindness and his limitless taking of pains were swayed by a sort of impersonal ideal of the editor of the *Nation*, seeming to rise above Mr. Garrison's self. What his own heart would move him to do, the obligations of the editor would often not permit. Again and again in these letters does this double relation come out, nowhere more characteristically, perhaps, than when he wrote to W. R. Thayer that "one of my closest friends has been treated, *Nation* fashion, quite objectively when passing under our critical harrow, and has almost entreated me not to notice another book of his." This was "the impersonal *Nation*," of which Mr. Garrison loved to think.

The temptation to enlarge upon this memorial volume is the easier to resist for remembering Mr. Garrison's own scruple, apropos of a notice of Mr. Godkin's Essays, lest anything should be written which it would be "indelicate" to print "in the editor's own paper." We only remark on the passion for verification which governed his whole editorial life, which was strong even in his days of weakness, and which showed itself pathetically when he was practically on his death-bed. So deep a love of minute accuracy—in him a part of the worship of truth—can seldom have so long presided over the work of so many writers.

Dante e la Francia, dall' Età media al Secolo di Voltaire. Per Arturo Farinelli. 2 vols.; pp. xxvi+560, xiv+381. Milan: Ulrico Hoepli.

Scholars have been long awaiting this important work, the result of *lungo studio e grande amore*, and their expectations are not likely to be disappointed. Professor Farinelli is in some respects the most learned literary scholar in Europe. His superb linguistic equipment permits him to write with almost equal facility in four languages, and his works include monographs on the legend of Don Juan, in Italian; on Goethe's and Humboldt's relations with Spain, in French; on the Spanish influences in German literature, in German; and on Calderon and Gracian, in Spanish. Nearly all of these are concerned with some aspect of "comparative literature," or the external relations between various national literatures; but in all the treatment attempts to get behind this external framework, to study the vital influence of one culture on another, to observe how the genius of an individual artist has been enriched by contact with alien art and thought. These conclusions are not the result of critical intuition, but are built up on the accumulation of details, the result of enormous patience and investigation. Acumen in the interpretation of these details is never lacking, and the style often has a personal and fanciful note that comes as a surprise among such themes. But the details really interest him more than the interpretation. His talent is essentially bibliographical; he takes pride in recording every book that touches his subject at any point, even when (as is too often the case) he can only assure us that the book is worthless; he has no new and large syntheses of literary history to offer; acute analysis of his details and luminous comment on them are what we expect.

The climax of these labors is to be found in this new book on Dante and France. After an introductory chapter on Dante's obligations to French literature, the author proceeds to discuss the converse obligation of that literature to Dante himself. But the scope of the book is only very slightly indicated by its title; it is really a history of the influence of Italian culture in France from the Middle Ages to the beginning of the romantic movement With a more than admirable erudition, checked by the enormous bibliographical apparatus, every detail of the progress of this influence is recorded, commented upon, and interpreted in the light of the national genius shaping itself in space and time. All the great names of French literature are passed in review, from the days of Christine de Pisan, Alain Chartier, Villon, Jean le Maire, and Rabelais; the rich treasure-house of renaissance culture, and the glories of the age of Louis XIV are ransacked for evidences of Italianate debts; and the harbingers of romanticism beckon ere the book closes. The two volumes are a monument of Italian scholarship, in which more than German patience has been relieved by the acumen of a fine Latin mind. But Professor Farinelli deceives himself in thinking that his main purpose is (as

he says in the preface) "artistic." His real interest, as we have seen, is historical, or rather bibliographical, the history not so much of literature as of books. Like many erudite scholars, he fancies that nothing but a florid and picturesque style is needed to transform learning into æsthetic criticism. But his fervor and floridity cannot hide the essentially erudite quality of his interest in literature; one has but to contrast the style of Benedetto Croce or Karl Vossler, in whose work lucidity and simple directness lighten the darkest reaches of taste and thought.

Two trifling drawbacks will impress themselves on every American reader of the book. The English names and citations are simply a mass of error; hardly a single citation is free from disfigurement. A well-known seventeenth-century poet is called "il *duca* di Rochester" (II, 196, n.); Glastonbury becomes "Glatonburg" (I, 101, n.); and even Shakespeare becomes "Shaskespeare" (II, p. xiv). In the second place, why does Professor Farinelli think it necessary to allude with a sneer to all scholars in whose work he has found some inconsiderable error or with whose opinions he does not happen to agree? Why allude at all to those whose lesser learning has been corrected, and so made futile, by his own monumental work?

Studies in English Official Historical Documents. By Hubert Hall. New York: G. P. Putnam's Sons. $3.75.

Probably the most significant advances in historical science at the present time have been made in the field of *Heuristik*, as the Germans call the science of the discovery and treatment of source material. All modern countries are more or less concerned with their archives, and are endeavoring to meet the needs of the scholars who use them. France has her École des Chartes, which trains archivists for the service of the state; America is attempting to give unity to her scattered historical forces, and to apply scientific methods to the gathering and publishing of material by State and central government. In no country has a more stupendous feat of this character been accomplished than in England. Sixty years ago her public records lay scattered in many places, in lofts and cellars, tanks and stables, under leaking roofs, and in water-drenched vaults. To-day, nearly all these records are securely housed in a magnificent pile of buildings, zealously cared for, arranged, and prepared for the use of students. They no longer serve the purpose of autograph-hunting collectors; they are no longer liable to be carried off by government officers, to find their way into family archives, private collections, or the auction rooms.

Hubert Hall, himself an official of this great repository, the Public Record Office, and the mentor and friend of scores of American students, has supplied this pioneer treatise introductory to a scientific study of archive material. Though many books have been written upon the public records of England, and though official indexes, lists, and guides have been prepared, no similar work dealing in comprehensive manner with the several aspects of English archives has hitherto appeared. Mr. Hall divides his work into three parts: the first relating to the history, classification, and analysis of the archives; the second, to the diplomatic study of official documents; and the third, to palæography, its requirements and uses. Each part is accompanied by a series of appendices, containing tables, lists, outlines, and classifications too elaborate for insertion in the text.

This work indicates the spirit of the times as far as the study of history is concerned. It represents the attempt of an historical scholar, who is also an archivist, to furnish an intelligent clue to the vast labyrinth of the public records, a commentary, born of experience and understanding. Mr. Hall, unlike the professional archivist, is able to point out, not only where historical material is to be found, but also how this material ought to be handled. What he says is an excellent corrective of many prevailing ideas regarding historical work in our graduate schools. His chapter on the purpose and scope of a bibliography of official historical documents, for example, is exceedingly caustic in its criticism of the unintelligent, inadequate, and untrustworthy character of much of the bibliographical work hitherto done. All these chapters of the first part should be carefully digested by every student who is planning to work in the Public Record Office.

The second and the third parts are of interest chiefly to the student of mediæval English history, for they concern technical questions. England has lagged far behind Continental schools in the systematic study of diplomatic documents; and even to-day knowledge of appropriate formulas, technical phrases, and nomenclature is confined to a mere handful of English scholars. Mr. Hall has taught these subjects for twelve years in the University of London and elsewhere, and all that he says bears the stamp of authority. His second part is limited to a classification, definition, and description of the several diplomatic instruments which issued from the chancery, from the Anglo-Saxon charter to the Sign Manual warrant of the present day. His chapter on palæography is a working manual which not only deals with the technique of the subject, but offers to the beginner many hints of exceptional value. Even experts will find here a readable account of a subject little known. No other work, British or Continental, combines in such an admirable manner the learning of the archivist, the grasp of the historian, and the suggestiveness of the teacher.

Science.

SCIENCE AND IMMORTALITY.

The belief in the continuation of personal existence after the death of the body was prevalent in very ancient times. The conception of the immortality of the soul, with which this older belief is usually confused, is, however, relatively modern; and although evolved from the more ancient notion, it has become quite diverse from it in form and content. The more ancient view was altogether part and parcel of the materialism with which the thought of the savage was permeated. Something that belonged to, and was characteristic of, the body of the man when alive and awake was supposed to leave him temporarily when he slept, and permanently when he died. It is true that this something came to be, in a measure, identified vaguely with the man's mental life; nevertheless, the distinction between mind and body not being clearly appreciated, the something that left the man's body and returned again diurnally, and that finally deserted it permanently, was thought of as endowed with bodily characteristics of a very definite nature. The much more modern notion of immortality appeared only in conjunction with the conception of a non-material soul—a conception which probably developed in connection with the earliest crude criticism of experience, although not explicitly appreciated until much later. But to the soul as thus conceived there still clung not a few materialistic traits, which belonged to its more clearly material prototype pictured to himself by the savage, traits which in truth still attach to the soul, as the average uncritical man of our own day thinks of it.

All this is sufficiently commonplace; but here, as often, we are prone to overlook the obvious. In the main, our beliefs are maintained without attempt to rationalize them; and when, with growth of intelligence, a demand arises for this rationalization, we are likely to accept our concepts without inquiry as to their origin, or as to the meanings of terms this origin has involved. Such is the case with the conception here considered. Among the people of the Western world, of which alone I can here speak, modern religion has translated the tenets of the ancient materialistic animism into its own *quasi* idealistic language, without substantial-

ly altering their significance; and, taking them thus, has woven the conception of the soul's immortality into the very warp and woof of its doctrine; but it has done so, in the main, rather as a matter of faith than of reason, and its devotees as a rule have thus naturally waived all critical examination of concepts or careful definition of terms. On the other hand, the student of science, which busies itself with material objects, noting that the soul is conceived of as non-material, has naturally turned away from the problem of its future existence. Where, however, this problem has been forced upon him, the scientist has not often stopped to consider the limitations of his habitual point of view, and has, therefore, been content to describe the soul as an epi-phenomenon, which flits shadow-like in the train of the mechanically ordered body, and goes out of existence when this body dies and is disintegrated. A view so subversive of a most cherished belief has naturally fired the religious man with holy indignation. But he has been content, in the main, to hurl anathemas at those who have thus disturbed his placid faith. Had he not been too well satisfied with the easy-going acceptance of an inherited dogma, the reasoning of the skeptical scientist might, on the one hand, have opened his eyes to his own lack of insight, and, on the other, might have led him to disturb the self-confidence of his scientific opponents by asking searching questions as to the meaning they attach to his own words and theirs. We shall never make definite advance in the solution of this problem of immortality until all parties come to something like a substantial agreement as to the meaning of soul, of personality, of the permanence of personality, of the relation of personality to body, etc.

In speaking thus of the mode of thought of the religious and of the scientific man, I, of course, leave out of consideration the religious thinker who is a technical metaphysician, for whom this doctrine of the soul's immortality has been a matter of serious discussion. And in our day, indeed, among philosophers of critical habit, we find the question receiving marked attention, as is clearly indicated, for instance, by the dissertations given on the Ingersoll Lecture foundation, and from time to time in the current numbers of the *Hibbert Journal*. But these interpretations of the doctrine are couched in terms which are entirely incomprehensible to the average highly intelligent and educated man, who, in natural dissatisfaction, turns anew to the devotees of science, whose speech seems not altogether an unknown tongue. The non-philosophical scientist, who, so far as metaphysical questions is concerned, is in the same class with these lay inquirers, comes forward from time to time with an encouraging answer to the doubts raised by his fellows. He, however, if we are to judge him by two recent works*, is not inclined to grapple with the difficulties which the metaphysician so keenly appreciates; but he seems content to rest upon hypothetical constructs, which not seldom display an amazing brilliancy of imagination, even if they do not convince one of their probable validity and value.

The discovery of such a mood in a scientist is likely to astonish us when we consider the contempt he has habitually accorded to hypotheses of a metaphysical type because of their lack of dependence upon experiences subject to experimental investigation—to astonish us until we recall that of late years in his own particular field he has indulged in a very riot of hypotheses, unverifiable by experience, in relation to the ether and atoms, to vortex rings knotted and unknotted, to electrons, etc., etc. These hypotheses are intensely interesting, and valuable in that they lend themselves to the correlation of a mighty array of facts in nature; but admittedly they are highly imaginative. It is not, then, so surprising after all to find in the books before us a wild use of hypotheses by men of training as physicists; nor can we discountenance these hypotheses altogether on the ground that they do not rest upon a firm basis, provided only they appear to lead to convincing correlations of experience. But such is surely not the case here.

Fournier frankly turns back to materialism, pure and simple. Upon the observations of continuity and of various grades of complexity in nature and life, he bases the assumption of the existence of attenuated, unobservable forms of matter which pervade the living body, and which still persist after death in forms which are of the essence of the individual during life. These correlated "psychomeres," he holds, live eternally as "astral bodies" in the atmosphere above the earth, assuming naturally fish-like or flame-like forms, which occasionally are given to our perception, but which more usually communicate with us through transformations more closely allied to our own nature, as in the ghosts and voices and "messages" of the mediums.

This hypothesis might be passed over as altogether unworthy of attention did not the writer make so much of, and show such a grasp of, facts favorable to the conception of continuity; were there not much strength in the general position he thus maintains; and did he not in support of his contentions make such full use of quotations from the works of serious scientific contributors, as, for instance, our biologist, E. B. Wilson. It is therefore worth while, perhaps, to call attention to the fatal defect in the author's argument, a defect which is at once apparent when we discover that the attenuated material particles which he assumes to exist in and of our living bodies, are designated as "psychomeres or soul particles"; when we note, in other words, that on reaching the unobservable he assumes, without a shadow of proof, that his matter has suddenly become mind. The possibility that this assumption is invalid does not seem to occur to our author; in fact, he can scarcely be said to give us any notion that he observes the leap he has taken. As a consequence, his conclusions prove to be entirely unworthy of serious consideration. They are not likely to satisfy the inquirer who looks for confirmation of the conception of the immortality of the soul, but will probably be used to strengthen their position by the spiritists who are becoming more and more annoyed by attempts like those of Podmore* and Bruce† to "naturalize" the phenomena they present to us.

Sir Oliver Lodge's book, however, must be taken more seriously because of the eminence its author has attained in the scientific world. The work is divided into four parts, two of which relate respectively to criticisms of the established English Church, and to "suggestions toward the reinterpretation of Christian Doctrine"; and which contain much excellent matter, although this is strangely placed in the volume, and bears little or no relation to the aim of the writer as suggested by his title and by the body of contents.

Turning to the author's principal contentions, we note that he finds himself deeply interested in the common man's conception of a separate soul essence, a conception which he accepts without adequate criticism; and he makes use of the very doubtful claims and theses of spiritism, and of notions derived from late studies of "dissociated personalities,"‡ etc., to develop what he conceives to be a scientific form of the concept of the soul's immortality. It may be well perhaps to present a brief summary of his argument, if such it may be called. "The soul," he tells us (p. 144), is "that part of man which is dissociated from the body at death,

that part which is characteristic of a living man as distinct from a corpse." It is also (p. 152), a "controlling and guiding principle which is responsible for our personal expression, and for the construction of the body under the restrictions of physical conditions and ancestry." "In its higher development it includes also feeling and intelligence and will, and is the storehouse of mental experience." Beyond this:

> In the higher organisms . . . it begins to acquire some of the character of "spirit," by which means it becomes related to the Divine Being. Soul appears to be the link between "spirit" and "matter" (p. 153).

We learn further (p. 159) that "no really existing thing perishes, but only changes its form." The "perceptible or incarnate existence" of a dew-drop "is temporary. As a drop it was born, and as a drop it dies; but as aqueous vapor it persists. . . . Even it, therefore, has the attribute of immortality" (p. 160). So is it with life, which cannot be a nonentity, nor can intellect and consciousness and will, nor memory and love and adoration:

> They are not nothing, nor shall they ever vanish into nothingness and cease to be. . . . For all those things which only share in a general life, the temporarily separated portion of that general life, will return undifferentiated and unidentified to its central store.

But "a memory, a consciousness, and a will, in so far as they constitute a consistent whole, constitute a personality; . . . personality or individuality itself dominates and transcends all temporal modes of expression, and so is essentially eternal wherever it exists" (p. 163). Again:

> If all that really exists is immortal, we have only to ask whether our personality, our character, our self, is sufficiently individual, sufficiently characteristic, sufficiently developed—in a word sufficiently *real:* for if it is, there can be no doubt of its continuance (p. 164).

Note that here it is the self and not the soul that is held to be immortal, and that we are not told by what criterion we are to be guided in determining when this sufficient reality is present. Sir Oliver further believes (p. 173) that "the facts of 'telepathy,' and in a less degree of what is called 'clairvoyance' must be regarded as practically established in the minds of those who have studied them":

> Telepathy alone tends mightily to strengthen the argument for transcendence of mind over body, so that we may reasonably expect the one to be capable of existing independently, and of surviving the other.

Further corroboration is found in the facts of automatism:

> The body, or some part of the body, though usually controlled and directed by the particular psychical agent which has composed and grown accustomed to it, can sometimes be found capable of responding to a foreign intelligence acting either telepathically through the mind, or telergically by a more direct process straight on the brain (p. 178).

Moreover, in the opinion of Sir Oliver, the subliminal faculty, and the occurrence of genius, point in the same direction.

One cannot read the above series of statements without being struck by the author's failure to grasp the connotations of the terms he so glibly employs; and especially by the lack of logical coherence in the propositions presented, and by the carelessness with which he introduces mere metaphors as steps in his argument, as, for instance, where he symbolizes the soul's immortality by reference to the persistence of aqueous vapor as a "form" existing before, and after, and through, the process of dew drop production. The soul which "includes what is connoted by the term 'mind' " is "the link between 'spirit' and 'matter,' " and "is *responsible* for the *construction of the body.*" This responsibility and constructive power, however, apparently do not belong to the soul as such, but only to that part of it which we call mind. Mind "has the power of liberating detents and pulling triggers in that strange physiological link with *another order of existence*" (p. 63). "Mind determines, life directs" (p. 64). Life guides, *i. e.*, is capable of the "influencing of activity without 'work,' the direction of energy without generating it, the utilizing and guiding existing activity for pre-conceived and purposed ends" (p. 61). These preconceived and purposed ends are, of course, psychic facts which strangely intrude without warning. And a similar intrusion is observed where we read, on p. 3, that "energy from the outside world" is "amenable to nerve messages sent from his brain, *and so ultimately from his mind.*" We might go further to show the changes of meaning given, in the course of our author's argument, to the word spirit, which at one time is dealt with as an attribute of the Deity—a view which, in a measure, we may share with him—and again appears to apply to the agency responsible for "spirit rappings." We might show like changes of meaning in his statement of pantheism (*e. g.*, pp. 31, 37, and 40); but this is not needful to confirm us in the view that his discussion will satisfy neither the philosopher, the logician, the scientist, nor the religious devotee.

To sum up, we have in Sir Oliver Lodge a man who has gained distinction in the realms of science, and who here essays to show to those whose interests lead them in other paths that science throws light upon the problems with which they are deeply concerned. In the argument of such an author we have a right to demand a well-defined sequence of propositions, a careful definition of terms and consistent use of the terms as thus defined, a rigid and judicious sifting and weighing of evidence, an avoidance of mysticism and of all unnecessary and doubtful hypotheses, and a clarity of exposition which aids the reader to separate merely theoretical positions from what is based upon firm foundation. That none of these demands are met by the author, must be apparent to the reader of the summary of the contents of the work as above given. His complete failure to exemplify the ideals of scientific method, and to satisfy the cravings of the intelligent among the audience to which he appeals, must be still more evident to one who reads the book itself, even without careful analysis and without special search for the basis of the author's conclusions. H. R. M.

G. R. Putnam of the Coast Survey, delivered a course of lectures on Nautical Charts at Columbia University last winter which John Wiley & Sons have recently published in book form. The account of nautical surveying and chart-making is not uninteresting, but, of course, it appeals to a very limited circle of readers. The historical notes are brief and dry. The detailed description of what a chart shows on its face is wholly superfluous to the navigator. As might have been expected, the author speaks favorably of the polyconic projection, so much disliked by practical men. Unnecessary alike to the hydrographer and the sailor, this little book may yet prove attractive to the curious in maritime matters.

"Hydraulics and Its Application," by A. H. Gibson of the University of Manchester, a volume of 747 pages and 310 illustrations, is issued in this country by the D. Van Nostrand Co. It might seem that with so many books on this subject but little new or valuable material could be found. Yet Mr. Gibson has undoubtedly succeeded in securing not only new material, but in treating it with some novelty. To be sure, certain propositions based on the processes of mathematical physics cannot be changed, and in all succeeding books must appear in practically identical form, but the author of this work exhibits, nevertheless, a refreshing element of open-mindedness toward the meaning of the various expressions derived for the action of fluids. The method of treatment is briefly stated in the first part of the preface:

> Were water a perfectly non-viscous, inelastic fluid, whose particles, when in motion, always followed sensibly parallel paths, hydraulics would be one of the most exact of the sciences. But water satisfies none of these conditions, and the result is that in the majority of cases brought before the engineer, motions and forces of such complexity are introduced as baffle all attempts at a rigorous solution. This being so, the best that can be done is to discuss each phenomenon on the assumption that the fluid in motion is perfect, and to modify the results so obtained until they fit the results of experiment, by the introduction of some empirical constant which shall involve the effect of every disregarded factor.

As a text-book this work can be used only by students who have had a proper

training in the calculus. It compares favorably, indeed, with the standard American text-book, "Merriman," and by some it might be regarded as superior, which is high praise. The volume is well adapted to the needs of students of engineering in the better class of schools, and deserves a place on the shelves of any practising engineer who is concerned with hydraulics.

A biography of the celebrated chemist, Justus von Liebig, in two volumes (Leipzig: Barth), has just been published by Dr. J. Volhard, now professor of chemistry in the University of Halle, but formerly a pupil and assistant of Liebig in Munich. In addition to interesting personal recollections, the work contains valuable material derived from Liebig's extensive correspondence with relatives, friends, and prominent scientific men, now preserved in the archives of the Royal State Library in Munich. This life is very well written, and gives not only an interesting sketch of the career and delineation of the character of a many-sided and exceedingly attractive personality, but also a valuable account of the origin and evolution of organic chemistry, of which Liebig was the real founder. He was also the first to discover its importance in agriculture and physiology. It is interesting to note that, though Liebig's laboratory at Giessen soon became known as the best in Germany, and attracted students from all parts of the country, many of his pedantic colleagues refused to recognize chemistry as a science, or to admit that it was entitled to a place in the curriculum of a university. The striking results of his research in the quantitative analysis of organic bodies caused him to be denounced by the Bishop of Mayence as a materialist, and the most dangerous of heretics. Soon after he was appointed to the University of Munich, in 1852, an interesting and important incident occurred. The young daughter of a friend suffered from a severe illness. After the crisis was passed, her stomach was incapable of digesting any kind of food, and she was dying of exhaustion. Liebig tried to devise some means of saving her. He walked for hours to and fro in the laboratory, and sat up all night, thinking how to provide nutriment which could be assimilated without undergoing the ordinary process of digestion. Early the next morning he sent for a chicken, and prepared from it a concentrated meat-juice, to which he added a few drops of hydrochloric acid. He came to the bed on which the girl lay, apparently breathing her last, and gave her a teaspoonful of the predigested food, and repeated the experiment at regular intervals. In a short time the patient began to regain her strength, and slowly recovered. Such was the origin of the *extractum carnis frigide paratum*, which has proved to be invaluable in many cases of sickness, and is everywhere highly prized as a source of sustenance. The biography contains an accurate and admirable account of the social, intellectual, and industrial condition of Munich at that time, which will be a revelation to most readers.

A book of interest at the present time is Dr. Karl Weule's "Negerleben in Ostafrika: Ergebnisse einer ethnologischen Forschungsreise" (Leipzig: Brockhaus). It is a volume of 524 pages, with a map and 196 illustrations, four of which are in colors. The author is professor of ethnology in the University of Leipzig, and also director of the Ethnological Museum in that city. He began his travels in German East Africa in 1906, exploring the whole country and embodying the results of his research in a scientific work of a popular character, free from racial antipathies. He describes the peculiarities of the indigenous tribes, their manners and customs, clothing and ornaments, marriage and family life, and ideas of law, religion, and art, illustrated by some simple and quite childish specimens of their drawings. The volume is a clear and unprejudiced psychological study of the negro.

The seventh International Congress for Criminal Anthropology will meet in Cologne in 1910.

Drama.

MR. BARRIE'S NEW PLAY.

"What Every Woman Knows," the latest comedy of J. M. Barrie, which may now be seen in the Empire Theatre, is not a good play in the technical sense, for it is awkwardly constructed and violates probability for the sake of situation, but it contains some wonderful studies of Scottish character, and is delightful entertainment. If the author could build a plot as well as he can compose a scene or illustrate a character in speech and action, he would be the greatest dramatist of his time. As it is, he stands almost alone in freshness of observation, originality of invention, and whimsicality of fancy, allied with an instinctive comprehension of human, especially Scottish, nature.

Nothing more absolutely original, more fanciful and yet essentially veracious than the first act, which is nearly worth all the rest put together, has been seen in the theatre for years. The idea of an ambitious Scottish railway porter, John Shand, turning burglar simply for the purpose of studying the books belonging to his more prosperous neighbors, is altogether new, as is the notion of the shrewd and equally Scottish neighbors appreciating the intruder at his true value, and securing him as the future husband of their neglected sister. But the most striking originality lies in the vitality of the personages concerned, the sharp and clear differentiation of the three brothers, and the wonderfully natural study of the surprised but shrewd and calculating porter—ever mindful of the main chance. The figure of the canny little housewife, Maggie, is equally alive. The whole scene is as human and actual as it is humorous. It was scarcely to be expected that the play could be maintained at this level and there is a falling off in the later acts, especially in the management of the episodes attending the conjugal crisis preceding Maggie's final triumph. But these mechanical weaknesses and glaring improbabilities at more than one point, do not greatly affect the general quality of the play or its moral.

The interest centres, not so much in the details of the story, as in the contrasted characters of the able but utterly selfish and humorless Shand, whose egotism blinds him to his own deficiencies, and of the faithful wife, whose saving grace of humor enables her to make allowances for her husband's gross ingratitude and folly and finally to awaken him to a realization of her superiority and the debt he owes her. Both are drawn with fine insight and consistency, and one of them, that of the husband, is played at the Empire with notable skill by Richard Bennett, but the part of the plain little Scotch housewife Maggie, with all her depth of feeling and latent humor, is barely suggested by Miss Maude Adams, who endows it with her own much more fascinating, but often inappropriate personality. Thus the piece fails of its full effect, but there can be no doubt of its public success. The general interpretation is capital.

"The History of the Boston Theatre, 1854-1901" (Houghton Mifflin Co.), prepared by Eugene Tompkins, manager of the house from 1878 to 1901, with the assistance of Quincy Kilby, is a record of the names of plays and performers, dates of production, etc., which will be valuable as a work of reference in theatrical libraries, and will be treasured by collectors for the sake of its gallery of portraits—many of which are rare. The volume, though practically devoid of biographical or critical matter, nevertheless contains much that is interesting and significant. In the first place, it bears striking testimony to the literary and dramatic value of the work which was accomplished during the thirty years (1854-1884) of the house's existence as a stock company theatre. All the best-known examples of the literary and poetic drama were interpreted in rapid succession by companies which could not be equalled today by any "all star" cast which could be formed. One comedy company, for instance—picked at random—contained John Gilbert, William Wheatley, E. L. Davenport, John E. Owens, George C. Boniface, L. R. Shewell, Charles Barron, Mrs. Gladstane, Mary Wells, Mrs. Skerritt, and Mrs. Ryer. Such instances might be multiplied almost indefinitely. It is worth noting that the famous old house was opened originally with "The Rivals" and "The Loan of a Lover," a programme which was the object of pulpit denunciation, on the score of its being "silly and coarse." What would the preacher have thought of some of our more modern entertainments? Where so much is omitted it was, perhaps, scarcely worth while to reprint the vulgar abuse which Edwin Forrest heaped upon John Gilbert, who had ventured to criticise his conduct. It appears that Edwin Booth first heard of the assassination of Lincoln by his brother

from the lips of the negro valet who awakened him on the morning after the tragedy. This is one of the very few anecdotes in the book, which indeed is but the groundwork of a history yet to be written.

The literature which has grown up about Friedrich Hebbel (see the *Nation* of December 17, p. 610) has received two new additions. In the series of Hebbel-Forschungen, edited by Richard Maria von Werner and W. Bloch-Wunschmann, there has appeared a study entitled "Die Tragödie Hebbels: Ihre Stellung und Redeutung in der Entwicklung des Dramas," by Dr. Johannes Krumm. Hebbel as poet of woman is treated by Hilde Engel-Mitscherlich in a little volume of 129 pages, called "Hebbel als Dichter der Frau." Both works are imported by G. E. Stechert & Co.

Alexander von Weilen, one of the foremost dramatic critics of Vienna and editor of Goethe in the Weimar edition, as also of Schlegel's translations of "Hamlet," "Lear," and "The Merchant of Venice," has written an interesting book of two hundred pages, "Hamlet auf der deutschen Bühne bis zur Gegenwart" (Berlin: Georg Reimer). It forms the third volume of the publications of the German Shakespeare Society.

Lyly's "Campaspe" was recently performed at Oxford, by the students of Lady Margaret Hall, in order to raise money for their library. According to the London *Times*, the dances had been studied from contemporary sources in the Bodleian. The players wore classical costume, but otherwise the lines were strictly Elizabethan, a proscenium and drop curtain being the only modern things noticeable. The tub of Diogenes was thrust on or off as needed, and the "shop" of Apelles was disclosed by the drawing of the traverse when song or dance occurred. The music was all of the period, or as near it as could be, except that to the song about Campaspe and Cupid, for which, in the absence of the original tune, W. H. Hadow had composed a setting.

That clever English writer, St. John Hankin, seems to tread upon very delicate and dangerous ground in his comedy, "The Last of the De Mullins," which has just been produced by the London Stage Society. Apparently, it is a satire upon the least precious sort of family pride. Janet De Mullin is the daughter of an ancient house that has been withering in mouldy but respectable insignificance for generations. Born with the spirit of revolt, she permits herself to love unwisely and too well. Being deserted by her lover, and unable to conceal her lapse, she goes to London, where she starts a hatshop, prospers, and boldly faces the world with her fatherless boy. By and by her parents become more or less reconciled with her, but are scandalized at the idea of a De Mullin making a living out of trade. They demand that she shall return and live in the old home, with the child; but she finds that she can no longer exist in the ancestral atmosphere, with its old-fashioned prejudices and pride, and therefore goes back to town to fight the battle of life alone, maintaining that she has been justified from the first by the maternal instinct which had prompted her. Mr. Hankin, it appears, found an admirable impersonator of his emancipated heroine in Lillah McCarthy.

Miss Evelyn Millard will assume the management of the London Criterion Theatre on February 1, and it is there that she will produce the new comedy that Robert Hichens has written for her.

Mrs. Evelyn Greenleaf Sutherland, writer for the magazines and author of several plays, died in Boston December 24. She was for many years on the dramatic staff of the *Transcript* and other Boston newspapers. She published "Po' White Trash and Other One-Act Dramas" and "In Office Hours and Other Vaudeville Sketches"; adapted Booth Tarkington's "Monsieur Beaucaire" for the stage; and collaborated with Gen. Charles King in producing "Fort Frayne," and with Beulah Marie Dix in "The Breed of the Tresbams," "Boy O'Carroll," "The Road to Yesterday," and "Young Fernald."

Music.

The Psychology of Singing. By David C. Taylor. New York: The Macmillan Co. $1.50 net.

When the writer of a book for singers and students asserts that "modern methods contain not one single topic of any value whatever in the training of the voice," it is usually safe to regard him without further examination as either a charlatan or as one of the numerous teachers who, without being humbugs themselves, try to make students believe that all their rivals are. It would be a great mistake to throw aside Mr. Taylor's book on any such supposition, for it is a treatise of unusual value and may mark the beginning of a new epoch in vocal instruction. Hans von Bülow once remarked that "Italy was the cradle of music and —remained the cradle." This is true in the sense that, while the overture, the symphony, the opera, the oratorio, originated in Italy, it was in other countries that these forms were developed and perfected. But in two things Italy has never been surpassed or even equalled—in the making of violins and in the training of singers. The "Stradivarius" and the "Old Italian Method" are still the models for the present and the future. Within a few years, however, it has been asserted that the secret of building violins equal to the old Cremonas has been found in Germany; and if Mr. Taylor is right, students of song will be able once more to enjoy the benefits of instruction by the old Italian method.

What was that method? It was no method at all, in the modern sense of the word. Little is known regarding the manner in which the Italian masters of the seventeenth and eighteenth centuries achieved such marvellous results with their pupils; but it seems certain that they gave no anatomical or acoustic instruction, no directions regarding the use of vocal cords, the tongue, the diaphragm, nasal resonance, and so on. In 1800 the old system was on the wane, and during the years 1840 to 1865 it was superseded by the modern "scientific" methods. How the practical method of the old teachers came to be forgotten is a mystery, as there were always traditions regarding at least the four essential precepts: "singing on the breath," "opening the throat," "singing the tone at the lips," and "supporting the tone." The most obvious explanation is that the method by which the old masters taught was purely empirical and that when Garcia, by his invention of the laryngoscope, in 1855, made possible the formulating of a scientific system based on anatomical knowledge, all the best teachers were lured to the new paths of research and neglected the old traditions. And that, in the view of Mr. Taylor, was a calamity from which singers are still suffering. The teachers devoted all their time to the study of three sciences—anatomy, acoustics, and mechanics—neglecting psychology, the one science which is of most use to them and solves the chief problems. To prove this is the object of the present volume.

One of the old Italian masters, Tosi, declared that no one who has not a good ear should undertake either to instruct or to sing, and that students should lose no opportunity to hear great singers, "because from the attention in hearing them one reaps more advantage than from any instruction whatsoever." Here is the germ of Mr. Taylor's doctrine. He cites Ffrangcon-Davies's remark: "The training of the ear is one-half of the training of the voice"; and Wesley Mills's advice to students to hear the best singers, to note carefully the *quality* of their tones, and to "*imitate these qualities* with their own voices." This advice, our author says, "may almost be described as revolutionary," and on this basis he develops his theory that imitation is the rational foundation of a method of voice culture. The voice needs no guidance other than the ear. No one questions the ability of the voice to sing by imitation a note of any particular pitch. Why, then, should it be unable to sing a note of any particular quality, guided only by the ear? Mr. Taylor is convinced that this was the old Italian method, and that the art of singing will continue to decline until this method is restored and the mechanical method of teaching in accordance with anatomical, acoustic, and mechanical principles is dropped.

It is a sweeping doctrine, but our author, it must be admitted, makes out a strong case. He is right in saying that the correct vocal action is naturally and instinctively adopted by the voice without any attention being paid to the operations of the vocal mechanism.

Such attention, he asserts, is, in fact, an actual impediment. As soon as conscious mechanical management of the voice is attempted, throat stiffness results; and throat stiffness is the only troublesome feature of the training of voices. If some teachers succeed with the mechanical method in turning out good voices, it is because they unconsciously apply also the imitative method, saying to the pupil: "Listen to me and do as I do." But most of the time is given to the "scientific" teaching. Mr. Taylor does not deny that modern teachers who know anatomy and acoustics may even improve on the old Italians; but their main principle should ever be to call the pupil's attention to the quality of the tones and not to the throat. He foresees difficulties in the acceptance of his advice: pupils are impressed by anatomical jargon as savages are by their medicine-men. And there is another difficulty which he does not note. How many teachers can sing the beautiful and emotional tones they want their pupils to imitate?

An added interest will be given to the programme of the New York Symphony Society on January 3 and 5 by the first appearance at these concerts of Geraldine Farrar, and the first production in America of Sir Edward Elgar's new symphony in A flat, opus 55.

The Prussian Cultus Ministry has promised 60,000 marks to the commission in charge of the publication of the complete works of Joseph Haydn. The preparation of the material to date has already cost about 250,000 marks. The chairman of the commission is Dr. Adolf Sandberger, head of the music department in the University of Munich.

François Auguste Gavaërt, the Belgian composer and writer on musical topics, and for many years director of the Brussels Conservatory, has died, at the age of eighty. He was born at Huysse, the son of a baker. In 1841 he went to the Conservatory of Ghent, took the Prix de Rome for composition, and in 1843 was appointed organist of the Jesuits' Church at Ghent, where, in 1846, a Christmas cantata of his composition was performed. The following year his Psalm, "Super flumina," was given with success at the festival of the Zangverband. His next important work was two operas, "Hugues de Somerghen" and "La Comédie à la ville." He now set out on his travels, stopping at Paris in 1849, and then going to Spain, where he composed his orchestral fantasia "Sobre motivos españoles." He was *chef de chant* at the Paris Opéra from 1867 until 1870, when the war with Prussia sent him to Brussels, where he was made director of the Conservatory of Music, succeeding Félis. Among his operas are "Le Billet de Marguerite," "Les Lavandières de Santarem," "Quentin Durward," "Château Trompetti," and "Le Capitaine Henriot." But his compositions have ceased to possess anything like the importance attached to his works in the field of musical science. He is the author of the authoritative work on orchestration ("Traité d'instrumentation"), and his books on Gregorian and other church music ("Leerboek van den Gregoriaenchen zang," "Les Origines du chant liturgique") are regarded as among the best on the subject. He is also an authority on the music of the ancient nations. Under his direction many historic concerts were given in Brussels. One of his reforms at the Conservatory consisted in placing the singing classes under the annual inspection of some celebrated vocalist.

Art.

A Chronicle of Friendship: 1873-1900. By Will H. Low. New York: Charles Scribner's Sons. $3 net.

The fragments of Mr. Low's book, which were published in *Scribner's Magazine*, give a somewhat false impression of the nature of the volume. The parts selected were mainly those dealing with the two Stevensons, Louis and "Bob," and many lovers of R. L. S. will be likely to turn to the book for further light on their hero. They will find little not already printed, but they will find many other things worth reading.

Many efforts have been made, both in fiction and in reminiscences, to paint the life of artists and of art students, but we know of none so successful as this. To one whose own student days in Paris, and at Grez and other such resorts, fell in the years immediately succeeding those Mr. Low writes of, it is little less than amazing to see how accurately the atmosphere of time and place is given, and how wonderfully the feelings and the sentiments of artistic youth are reproduced. And in the later portions, the point of view of the artist, his outlook on life and on the problems of his own profession, are rendered as, to our knowledge, no novelist or writer of memoirs has rendered them.

This is not to say that Mr. Low has given us a profound philosophy of art or a contribution to art criticism. What little of such matters the book contains is *obiter dicta*. It is a picture of life that the author offers us, not a theoretical discussion, and it is as a picture, better even than the best of those he has produced in another medium, that it will be enjoyed. It is a picture painted without visible method or preoccupation of style. Mr. Low is leisurely and rambling, writing "as it comes," in a style, which, if sometimes confused, and never concise, yet possesses great charm—the charm of the pleasant, natural talk of a genial and cultivated man of wide experience, trained powers of observation, and retentive memory.

Among the friendships chronicled are those with many artists of national and international importance, and the book is valuable for the anecdotes of these men which it contains; but its chief interest is, after all, that of all autobiographies — the interest of conscious or unconscious self-revelation—and, although not formally an autobiography, it is among such works that it may, not improbably, take a permanent place as not the least delightful in that delightful company.

"The Reminiscences of Augustus Saint-Gaudens," edited by his son, Homer Saint-Gaudens, begins in the *Century* of January.

The Oxford University Press is preparing to issue a series of volumes of British historical portraits. The first book of 103 portraits (from Richard II to Henry Wriothesley) is about ready for publication. A general introduction is provided by C. F. Bell, and with each portrait there is a brief biography by C. R. L. Fletcher.

"Some Notable Altars in the Church of England and the American Episcopal Church," by the Rev. John Wright (The Macmillan Co.), is a quarto which will interest Protestant churchmen, for it contains 114 plates of altars and altar pieces—in short, of the east ends of churches as seen from within—and reveals much in the way of traditional and recent tendencies in that phase of architecture. If the architect or the sculptor be less attracted, it will be because of the inevitable reappearance in such a collection of the old forms and arrangements. Unfortunately, the opportunity to show us the best obtainable has not been fully utilized. The plates are uneven in quality; the reredos of Truro Cathedral, for example, is the work of Pearson, one of the few men who can design, in architecture; but the half-tone (plate 27) is very dim and vague; evidently the original negative was poor. The account of this work is, moreover, a perfunctory notice furnished in print by the cathedral authorities. The half-tone of the reredos of Gloucester Cathedral, and those of Worcester, Ely, and Salisbury are better. But all these are designed by George Gilbert Scott, the typical busy architect, turning out much work, all of a recognized type, which displays to the full the monotonous dulness of a non-artistic period. The altar of York Cathedral is by a more artistically minded man, George Edmund Street, but this is what is called a "triptych," or a framed sculpture with many figures, with wooden doors to shut upon it, so that the architect had no chance to show his hand. There are several east ends of wholly neo-classical design, of which the most grandiose is that of St. Paul's Cathedral. The most important of the ancient examples is the vast screen of Beverly Minster, elaborately restored, and the reredos of All Souls' College at Oxford, a structure of 1438, which, as we are told, was concealed throughout the civil war, and for years thereafter, by a plastered wall built across the east end of the chapel. The book gives also the silver altar of St. Mark's Church, Philadelphia, and the apse of the Church of the Savior, West Philadelphia, with an important painting by E. H. Blashfield filling the semi-dome.

"A History of British Water Colour Painting," by H. M. Cundall (E. P. Dutton & Co.), strikes one at first sight as a superfluous, if handsome, book, and a careful reading does little to dissipate the impression. It contains besides the history

proper, in which such alien matters as the illumination of manuscripts and portrait miniature are perfunctorily included, a somewhat elaborate account of the formation and vicissitudes of the several water color societies, a list of their members in the order of election, and an alphabetical register of succinct biographies. Now the British water color school, if it does not loom very large in the general history of art, is naturally interesting to those of Anglo-Saxon race, if only because being on the whole a poor thing it is their own. A writer who had anything in the way of valuable opinion or substantial addition to facts to contribute would not lack his welcome. Mr. Cundall has chronicled some previously unbroached small beer anent the societies; for the rest, his book is a compilation that nowhere reveals either unusual taste or intelligence. It is written in very slovenly English, and abounds in minor but significant inaccuracies. The author believes that the Romans painted frescoes, meaning presumably wall paintings; he regards tempera as a branch of water color (why not fresco then?), thinks that Holbein may have learned the difficult art of miniature painting from a British (!) practitioner named Lucas Hornebolt. The encyclopædic portion may be convenient for those who are too indolent to use the obvious books of reference, or are devoted exclusively to aquarelle. Fifty-eight color plates of fair execution are presumably the excuse for the general text. It at least affords one tidbit. In 1807 the Associated Artists in Water Colors passed a resolution requiring every member to exhibit at least five works "of which or any greater number, two-thirds may consist of portraits, but the remainder must be works of imagination." Alas, the percentage of imagination has never subsequently been so high in the British water color school.

With Dr. Oswald Sirén's valuable monograph, "Giottino und seine Stellung in der gleichzeitigen florentinischen Malerei," (Leipzig: Klinkhardt & Biermann), begins auspiciously a new series, Kunstwissenschaftliche Studien. Dr. Sirén attacks the obscure problem of Giottino with his usual acumen. The method is analytical after the manner of Morelli—a procedure here forced from the fact that documents are virtually absent and the Florentine tradition of this painter is confused from an early time. Dr. Sirén accepts the tradition that Giottino was the son of Maestro Stefano. It seems to us that this relationship is made merely plausible. Our artist, rather a feeble person in essentials, never emulates the plastic manner of his great namesake, but seeks, like Ambrogio, spatial effects, and, like the Sienese generally, a decorous and symmetrical arrangement embodied with little real modelling in gay decorative colors. Space fails us to follow Dr. Sirén's interesting and usually convincing reconstruction of the work of Giottino. In brief we may note that he has doubled the old list, and in especial that in the grandiose but ruined Calvary in the chapter house of Sto. Spirito he has virtually discovered and first justly appreciated one of the finest trecento creations in Florence. Naturally this new list will be challenged at many points. As usual, Dr. Sirén has cast his net widely. He discusses the whole course of painting in the generation after Giotto, of whose grand manner Andrea Orcagna is declared to be the only real inheritor. There are, for example, provisional lists, embodying many new attributions, for Taddeo Gaddi, Giovanni da Milano, Andrea da Firenze, Agnolo Gaddi, Antonio Veneziano, and Spinello Aretino, while Buffalmaco is discussed in the text. Every serious student of the period must have a book the varied interest of which we have only indicated. For the æsthetic appreciation of the time this study is also important. It confirms the isolated position of Giotto as the single genius whose mind was on the real issues of painting. The minor talents slipped back readily into the Byzantine habit of diffuse narrative and calligraphic formulas. The reform of Giotto meant meat too strong for the babes that surrounded and followed him. Critics like Dr. Sirén help us to understand how much of minor and graceful ingenuity may be detected in artists whose general influence was distinctly retrograde. We thus free ourselves from misleading analogies with biological evolution, and realize how very individual and naturally inconsecutive is the human product that we generalize under the name of art.

Prof. Alessandro Chiappelli of Florence announces the discovery of an unusually well-preserved fresco, belonging to the middle of the fourteenth century. As a representative of the League of Friends of Florentine Monuments, he obtained permission to reopen and examine some of the old shrines on the south side of the Arno. In a large shrine, at the corner of the Via della Chiesa and the Via del Leone, behind the Church of Santa Maria del Carmine, he discovered a fresco which represents the Virgin seated on a Gothic throne, holding the Child, who blesses with his right hand and holds in his left hand a small castle, on which are some half-effaced Gothic letters. There are gold halos and gold arabesques on the Virgin's mantle and robe. There are four very beautiful angels above the Virgin, and below are St. John the Baptist and a praying monk. The artist belongs to the school of Giotto, and the work shows notable resemblances to that of Maso (or Maso di Banco, as he is also called), in the chapel of San Silvestro in Santa Croce, and to his Deposition from the Cross in the Uffizi Gallery.

At Christie's, London, on December 12, Nattier's Portrait of the Marquise de Rumillys, in white dress, with pale blue robe and powdered hair, brought £2,940.

Finance.

THE PASSING YEAR.

To-day ends a curious financial year, concerning whose true relation, both to the years which preceded and to those that will follow, nobody can at the moment speak with assurance. There has been substantial recovery; but it is not easy to determine whether that recovery has or has not been more rapid than is usual in the twelvemonth following a panic. The familiar test of iron production, for example, shows a rise in the weekly output from 232,652 tons, at the opening of last January—the low level—to 391,102 at the beginning of the present month. Turning back a decade and a half we see that from the weekly output of 73,895, which, on October 1, 1893, marked the nadir of that trade reaction, production had got back by the last month of 1894 to 168,762. That was a much larger ratio of increase; yet 1894 is classed as a period of slow recovery.

The panic of 1873 witnessed a sudden plunge of industry, directly from a pinnacle of unparalleled activity and high prices. In this respect, 1907 resembles 1873 more closely than it does 1893; one might expect, therefore, to find the analogy between those two after-panic periods more exact. And, in fact, there have been many close analogies. To which of the two years, 1874 or 1908, would the reader suppose the following description to apply?

> Having passed through the extraordinary crisis, there was a general rebound from the previous depression, and an expectation of renewed buoyancy in business affairs, which was not really warranted by the facts of the case. This general anticipation of a rapid and wonderful recuperation from the effects of the panic is not without significance, as it has formed, to a great extent, the standard by which the actual results of the year have been measured. . . . The effects of good crops in the principal articles of agricultural produce were undoubtedly beneficial. . . . Rigid economy was practised alike by all, from the largest corporations to the humblest individual.
>
> Railroad earnings showed in most cases a material falling off as compared with previous years, so far as their gross receipts were concerned, but a great economy in working expenses, which made net earnings of a number of prominent lines equal to, or greater than, those of the preceding year. . . . Prices of dividend-paying stocks were well maintained, particularly in the last half of the year.

This citation, which so closely describes the events of 1908, is taken from the *Financial Chronicle* of January 9, 1875, in its review of the year just ended. It certainly suggests reflection, as to whe-

ther, after all, 1908 has differed so widely from a normal after-panic year.

The same review, however, contains one or two passages which do not at all describe 1908. Money was relatively quite as easy then as in the present year, and surplus bank reserves as large. But, we are told, "the stock market was less agitated by violent fluctuations, and less influenced by speculative combinations, than for many previous years," and as a consequence, "the course of prices was thus left to be governed more by natural causes, and by the actual values of the several stocks." Here is a contrast which may well make the reader pause; it is possibly a key to the characteristic events of 1908. Are we better off at the close of the present year, or are we worse off, because of the wild speculation for the rise which, from January to December, has rioted on the Stock Exchange? If that speculation were to be considered in itself, all right-minded people would answer, Very much worse off. No good can come from such wholesale dissemination of delusion, falsehood, and mistaken judgment of industrial and economic conditions as has marked every outbreak of the kind this year, and certainly nothing can be gained by a 10 or 20-point rise, manipulated by high financiers, only to be followed by a sudden and almost equally large decline, with consequent losses imposed on the unlucky speculators and investors.

On the other hand, and after all this is said, there is the other possible inference that, underneath all these demonstrations of perverted reasoning, there may be a substratum of resources, and genuine confidence which will at any rate make the second and third of this generation's after-panic years something different, even in the real things, from the corresponding years after 1893 and 1873.

Apropos of the Darwin Centenary

V. L. KELLOGG'S DARWINISM TO-DAY

A simple and concise discussion for the educated layman of present-day scientific criticism of the Darwinian selection theories, together with concise accounts of the other more important proposed auxiliary and alternative theories of species-forming. With special notes and exact references to original sources and to the author's own observations and experiments.

"Its value cannot be overestimated."—*David Starr Jordan in The Dial.*

"Can write in English as brightly and as clearly as the old-time Frenchmen. . . . In his text he explains the controversy so that the plain man may understand it, while in the notes he adduces the evidence that the specialist requires. . . . A brilliant book that deserves general attention."—*New York Sun.*

W. A. LOCY'S BIOLOGY AND ITS MAKERS

Covers the rise of biology from the renaissance of learning to the present. Part II. is devoted to the "Doctrine of Organic Evolution."

"Entertainingly written, and, better than any other existing single work in any language, gives the layman a clear idea of the scope and development of the broad science of biology."—*The Dial.*

"Whether the reader be layman, or a college student, or a biologist whose life work is nearing completion, this summary of achievements will be an inspiration. Introduces us in a charming way to the human side of the scientists. A well chosen reading list, an excellent index."—*The Nation.*
